Dr. Boverton Redwood, in proposing "The Houses of Parliament," said that the progress of the industry in which the Association was so much interested would largely depend upon the attitude of the Legislature. Fortunately, they had friends in court, who had already shown a deep interest in the subject. With the growth of population they could not rest satisfied with the means of locomotion which had sufficed for the past, and transport must receive much greater attention than hitherto, and he could not conceive of any subject more worthy the attention of Parliament.

Mr. W. F. Lawrence, M.P., and the Hon. Arthur Stanley, M.P., responded to the toast, the latter in his best and most facetious vein. He, referring to the Leader of the House of Commons as an automobilist, said that from what little he had seen of him on a motor-car he was certain that they would find in him an ardent supporter of accelerated speed. The Front Bench, he thought, would also follow the Leader's example in time. He thought, however, that instead of leaving it to policemen to say when a speed of twelve miles an hour was exceeded, it might be better to say that they were not to endanger the public safety.

Mr. A. G. Lyster, engineer-in-chief of the Dock Board, proposed "Automobilism, Heavy and Light." He felt certain of the ultimate success of automobilism, though there were necessarily anxieties arising from the opposition in certain quarters, which tended to delay its progress. The Automobile Club was warmly to be congratulated on the way in which it was approaching the difficulties of prejudice and obstruction by demonstrating the value and safety of the automobile. Regarding the heavy motor-wagon and the legislative difficulties it had to contend with, Mr. Lyster said that the series of trials held by the Self-Propelled Traffic Association demonstrated that an excellent working machine could be constructed, though they were prevented by legal restrictions from building a wagon which could compete with the heaviest form of horse-drawn lorry. This was an unsatisfactory condition, and it was to be hoped that Parliament would take an early opportunity to remove the restriction. Personally, he had every confidence in the commercial value of the wagon. Having had twelve months' experience of one, he was enabled to say that it could do four times as much work as a horse and lorry, and at one-half the cost.

Mr. Alfred L. Jones, responding, said nothing could be of more importance to Liverpool shipping than cheap motor traffic. There was no end to its possibilities. Regarding the relations of this country to its colonies, there never was a time when those relations had more need to be strengthened in view of foreign competition. The remaining toasts included "The Corporation of Liverpool and Other Corporations," proposed by Mr. W. Becket Hill, and responded to by the Lord Mayor of Liverpool and the Mayor of St. Helens; "The Automobile Club and its Affiliated Centres," given by Professor Hele-Shaw, and acknowledged by Mr. M. Mayhew and Mr. Norman Macdonald; "The Officers and Competitors of the Trials," proposed by Mr. A. L. Jones, and responded to by Mr. S. B. Cottrell and Mr. J. L. Thornycroft; and "The Chairman," proposed by the Hon. John Scott-Montagu, M.P., and suitably acknowledged by the Earl of Derby.

FURIOUS DRIVING CASES.

AT Marylebone, before Mr. Plowden, J. Lawson, of Hampstead, was charged on a summons with driving a motor-car at a furious pace on the 18th May. Police-constable Wood, 434 D, said he saw a motor-car containing four persons travelling along Park Road, Regent's Park, at half-past two in the morning at the rate of 20 miles an hour. The defendant was in charge of the motor, and when the witness called upon him to stop, he and the others in the car simply laughed and went on. About 100 yards further down the road the car collided with the wall of a depository and damaged the gates to the extent of a couple of guineas. Mr. Plowden: Was he still laughing? Constable: When I told him he would be summoned he said, "By jove, wasn't it a lark." Mr. Plowden: What caused him to collide? The Witness: A van turned out of a side street, and when the defendant put on his brake the motor swerved and ran into the wall. It was a danger to the public. A solicitor, who defended,

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs.

said his client started with some other young men from Hampstead, intending to run to Margate, and they chose the early hours of the day as most suitable, as there was but little traffic then. But the police had made a mistake as to the pace, as they were not going faster than from 10 to 12 miles an hour. The motor skidded, and ran against the wall. The defendant, in his evidence, bore out his solicitor's statement, and added that he did not recollect laughing at the constable. Mr. Plowden: Surely you must know; are you always laughing at policemen? The Witness: Oh, no. Mr. Plowden: Perhaps there is something in what you said to the constable, you were out for a lark. But this rapid travelling is a serious danger to the public in towns, and you will have to pay a fine of 40s., with 2s. costs.

At Clerkenwell, Edouard Miscopain, of Long Acre, was summoned by Inspector Dyball for driving a motor-car on the 4th May, in Camden Road at a greater speed than was reasonable having regard to the traffic on the highway. Evidence was given that the car was going at about 20 miles an hour. Defendant said he lost control of the machine on going down an incline. He was ordered to pay the costs, 2s.

At Steyning, Augustine Gustave was summoned for driving a motor-car at an improper speed at Southwick. Police-constable Bristow stated that on Sunday, May 12th, in consequence of complaints received, he was in Albion Street, Southwick, and at half-past six in the evening he saw a motor-car coming along very fast from the direction of Shoreham. He timed it along a measured furlong with a stop watch, and finding that it was travelling at an excessive pace he ordered the driver to stop. He told defendant he had covered the furlong in 21 3-5ths sec., which worked out at the rate of over 20 miles an hour. There were a lot of people about at the time. Questioned by Mr. P. de la Chapelle, the witness affirmed that he could correctly gauge the time when the defendant reached the commencement of the furlong, notwithstanding the fact that he was stationed about 300 yards away. The defendant, questioned by his advocate, stated that his motor was travelling at the rate of about 10 miles an hour. He knew that because the rate was controlled by a lever. Answering the Magistrates, the defendant said it was possible for him to go faster. The Magistrates convicted, and stated that motor-cars were limited to a speed of 12 miles an hour. A fine of 17s. 6d., including costs, was imposed.

At East Harling Petty Sessions, Paul Delawille, a Frenchman, employed by Count Zborowski, of The Manor, Garboldisham, was summoned for having, on the 9th May, at Bridgham, driven a motor-car at a greater speed than 12 miles an hour. Defendant admitted the offence and said he did not know the law in this country. Superintendent Wright said he had seen the Count, and it was not his wish that his servant should drive so fast. A penalty of 10s. and costs, 11s., was imposed.

At Steyning, Harvey Ducros was summoned for driving a motor-car at an improper speed at Southwick on Sunday, May 19th. He did not appear, and Police-constable Bristow, who proved the offence, stated that defendant was going 15 miles an hour. After defendant left him he timed him for a furlong, and found that he covered it at the rate of about 14 miles an hour. Henry Chatfield, a gardener, of Southwick, also gave evidence. Superintendent Hooker stated that he had received complaints from the Southwick Urban Council on the subject. A fine of £1 7s., inclusive of costs, was imposed.

At Sevenoaks Police Court L. F. Harrison, a resident of Sevenoaks, was summoned for driving a motor-car at a greater speed than was reasonable and proper on May 16th. Mr. W. A. Wardley, solicitor, appeared for the defendant, and pleaded not guilty. P. S. Croucher stated that, seeing a motor-car being driven at a very furious rate in the Bradbourne Park Road, he stopped it and asked Mr. Harrison if he was in charge of it. When he replied in the affirmative witness said he should report him for travelling at an excessive speed. Witness had measured out a distance of 130 yards in the road, which was covered by the car in just under ten seconds. Therefore, the car had been travelling at the rate of nearly 27 miles an hour.—Cross-examined: When he first saw the car it was just rising on the brow of the hill. The driver stopped it within sixty yards after witness put up his hand. There was nothing to obstruct his view of the car. A constable who was in company with the last witness corroborated. Charles Poole said the motor-car passed his house "like a flash of lightning." Without exaggeration, he should say it was travelling from 25 to 30 miles an hour. Mr. Wardley, in addressing the Bench, said the value of the evidence of the last witness could be gained from his statement that a flash of lightning travelled from twenty-five to thirty miles an hour. He submitted that the police had made a miscalculation, but if the defendant had travelled at a greater speed than was reasonable he was extremely sorry. The safety of the public, however, was well looked after in the inventions made from time to time, and a car could be stopped almost instantly. Mr. Wardley called David Haxton, private engineer to the defendant, who said the car was one of the best made, and the brakes were so powerful that if he chose he could stop it dead. With regard to the summons against Mr. Harrison, witness said that on the other side of the hill he slowed down to a speed of about four miles an hour to allow a cart to pass, but when he went down the hill he drove at about fourteen miles an hour. It was quite impossible for the car to travel at twenty-seven miles an hour. After brief deliberation the Magistrates decided to impose a fine of £1 and 19s. 6d. costs.

At Gravesend Police Court last week Harold Cosh, son of the licensee of the Clarendon Hotel, was summoned for furiously driving a motor-car

on the 14th ult. The case had previously been adjourned. P. C. Pagram said at about 5.35 on the 4th ult., he was going up Windmill Street to Victoria Avenue. He saw a motor-car coming over the Hill, and noticed that it was coming at a very furious rate. He considered it was going at the rate of twelve to fourteen miles an hour. He could scarcely see the car for the dust it was throwing up. He did not believe it would have been possible to pull up the car in its own length. John Adlington Mason, considered that the policeman was quite within bounds in saying that its pace was twelve miles an hour. Other evidence having been given as to excessive speed, Mr. Clinch, addressing the Bench for the defence, asked the Magistrates to keep their minds perfectly open until they had heard all the evidence. They had not had a witness before them who had had the slightest experience of motor-cars. Mr. Mason had said he was nervous of them, perhaps, not unnaturally. There were persons in the car whose word could not be disputed by anybody. Defendant was driving Captain Kidston, of the Black Watch, who had taken Wombwell Hall and the Earl of Darnley's shooting. The car was going at less than ten miles an hour, and could be stopped in three yards. Captain Kidston, 3rd Black Watch, said he had business at Cobham, and arranged with the defendant to take him over. There were six in the car. They returned to Gravesend for him to go back to town by the South Eastern Railway. He had had considerable experience of motor-cars, and one of his friends on the car had had as much experience as he. It took them a little under half an hour to get from the keeper's house at the top of Thong Lane, at Cobham, to the station. They came down Windmill Street at a pace under ten miles an hour. He had ridden up and down Shaftesbury Avenue in London at a greater speed than this. Harold Cosh, the defendant, said he was the owner of the car, and drove it on this occasion. In Windmill Street, on the day mentioned, they were going at ten miles an hour. The clutch was off the engine, and the car was going down the decline by its own weight. There were two brakes on the car. They were not going at a furious rate, and there was no occasion to go fast. He could pull up the car in its own length (about three yards), when on its highest speed. On this occasion he could have pulled up in eight feet. The Bench retired, and after deliberation the Mayor said they had come to the conclusion that the case was proved, and defendant would be fined a guinea and costs. Mr. Clinch said, on the previous Friday the witnesses for the prosecution were not present, and he applied for the costs to be allowed for that hearing. The judgment was then altered to a fine of one guinea, without costs, and the Chief Constable was allowed to pay the costs of his witnesses from this amount.

At the Leeds City Police Court before the Deputy Stipendiary Magistrate (Mr. B. R. Stansfeld) Mr. Herbert Walter Ladell, surgeon, was charged with having driven a motor-tricycle "at a greater speed than was reasonable." Police-sergeant Rudd stated that at six o'clock on the evening of the 21st ult., Mr. Ladell passed along Beeston Road on a motor-tricycle, and for a distance of 250 yards he travelled at more than twelve miles an hour. Inspector Blakey was going in the same direction on a bicycle, and was left a long way behind. Mr. Arthur Willey observed that the provisions of the Order only forbade a greater speed than fourteen miles an hour, and it was impossible for the machine to go ten miles an hour on the day in question as it was out of order. Mr. Stansfeld said that on a much-frequented road it was required that the speed should be reasonable, and ten miles an hour was not reasonable on Beeston Road, which was within the city boundary. Inspector Blakey deposed that the machine passed him at a speed of about fourteen miles an hour. Mr. Willey said he would be surprised if it were held that ten miles an hour was too great a speed for such a vehicle. Defendant stated that the motor was out of order as it "missed fire," and he had to use the pedals for the slightest incline. He never got up to nine miles an hour. He called Dr. Rock, who had ridden the machine the same day, in support of his statement. Mr. Stansfeld said it was very difficult to deal with questions of speed, and a good deal of the evidence was speculative, but he thought the motor was going more than ten miles an hour, which was too great a speed in that locality. As the police did not ask for more than a nominal penalty the fine would be one of 10s. including costs.

COLONEL KNOX, Aldershot, pleaded guilty to driving a motor-tricycle at a speed exceeding twelve miles an hour at Frimley on May 15th. P. S. Coleman gave evidence. The defendant said he had his machine under perfect control. Fined 10s. and costs.

At the Chertsey Petty Sessions, Lucian Le Gros, civil engineer, London, was summoned for driving a light locomotive which was drawing another vehicle, at a greater speed than six miles an hour, in Weybridge, on May 5th. Mr. Staples Firth defended. P. C. Killick stated that at 7.20 p.m. on the 5th ult. he was on duty in Thames Street, Weybridge, when he saw defendant driving a motor-tricycle at a rate of from 10 to 12 miles an hour. As he approached witness saw he had a trailer attached. A lady was riding in the trailer. He called to defendant to stop, and he pulled up in about thirty or forty yards. Defendant admitted that he was travelling from 10 to 12 miles an hour. He produced a licence, which witness examined to verify his name and address. He did not read the licence to see what it contained. Defendant, in evidence, said he had been largely identified with motor mechanics for many years. When he got the car in question the officials at the local office of the Inland Revenue told him that for all purposes of the law the tricycle with the attachment was treated as one vehicle. He paid two guineas for his licence, the Inland Revenue people telling him that the vehicle must be classed as one with more than three wheels.

He got the two guinea licence after the policeman stopped him. Basil Joy, London, consulting engineer, gave it as his opinion that, considering the fact that the back seats were fastened to the tricycle with nuts, and that to attach it required a spanner and a certain amount of mechanical knowledge, the tricycle with the attachment was one vehicle. With regard to the tricycle alone, the front wheel could be removed and a couple put in its place, fastened in just the same manner as the attachment that had been described as a "trailer." He would not call that anything but one vehicle. Mr. Firth, in addressing the Bench, argued that the Act was intended to refer only to vehicles that could stand independently and be used without other machines. The attachment to Mr. Le Gros' tricycle had nothing with which it could be steered. After a short discussion, the chairman (Mr. J. G. Pilcher) announced that defendant would be fined 40s. Mr. Firth: 40s.! Why? The chairman: Because we think so. Mr. Firth: Then I must take the case to the High Court. I ask you to stay execution for seven days.

We understand that the case will probably be taken up by the Motor Union. As is well known in the motoring world, but apparently not yet in magisterial circles, the Inland Revenue authorities long ago decided that a motor-cycle and a trailer are to be treated as one vehicle.

WITHOUT A LIGHT

At Peterboro' Arthur J. Robertson, of Woodstone, was summoned for riding upon a motor-car in Narrow Street at 11.5 p.m. on May 22nd without having a light attached. John A. Bingham, auctioneer and landlord of the Royal Oak, Bridge End, was summoned for using improper language at the same time and place. Mr. F. W. Atter represented the defendants. P.C. Hall said he saw the motor-car enter Narrow Street at the market-place end. It was travelling at a high rate, and when it passed Wentworth Street someone shouted, "You've got no light." Mr. Robertson at once stopped the car and attempted to light the lamp. Witness, who had been standing near the Waggon and Horses, spoke to him about the speed and also about riding without a light. Mr. Robertson apologised, and, failing in his effort to obtain a light, went to his shop in Bridge Street and procured another lamp. There was no oil in the first lamp. As to the second case: when witness said the car was going at from twelve to fifteen miles an hour, Mr. Bingham, who was with Mr. Robertson, made use of an improper expression. He repeated the bad language two or three times. In cross-examination witness admitted that he might have said to Mr. Bingham "It won't pay you to dictate to a policeman." Defendants went into the witness box and said they started out for a ride at 9 p.m., lighting up beforehand. When they reached the Cathedral gateway on the return journey they noticed that the lamp was out. They got out and relighted it. The vibration caused by running down Narrow Street extinguished it again, and directly they discovered the fact they stopped the car. Mr. Bingham admitted that he might have used one word attributed to him, but not the other. The Bench convicted in each case. Robertson was fined 10s. with 2s. costs, and Bingham 10s. with 5s. costs.

MOTOR-CYCLE RACING AT CHICHESTER.

Two motor-cycle events were included in the race meeting held at Chichester, under the auspices of the Chichester Cycling Club, on Whit Monday. In the two miles motor-cycle handicap there were three competitors, H. Humphry and W. J. Shippam (scratch), and T. S. Adeock (360 yards). Humphry at scratch passed Adeock after completing the first mile and eventually won by half a lap, Shippam being fifty yards behind Adeock. Time, 4 min. 47 secs.

The second event was a Three Miles Motor-Cycle Handicap. First heat: R. Dennis, Guildford, tricycle (scratch), T. H. Tessier, London, bicycle (440 yards), H. Humphrey, tricycle (100 yards), W. J. Shippam, tricycle (100 yards). Dennis, who rode a tricycle of his firm's make, managed to beat the bicycle (a Werner) by about fifty yards. Tessier was greatly favoured because of the fine speed he showed in a trial spin, and it was subsequently elicited that before the contest the machine was knocked over, fracturing the pipe from the carburettor to the mixing chamber. Humphry was third with Shippam close up. Time 6 min. 52.4-5 sec. In the second heat E. B. Blaker, tricycle (50 yards) beat T. S. Adeock, tricycle (400 yards) at the first corner of the last lap, and won by about 50 yards. Time 7 min. 34.1-5 sec. The final heat, which was likely to be the most exciting, so far as the result was concerned, was deprived of a big finale through Dennis getting hung up in the clump of bushes at the south end, and losing a lap. He started again, winning the applause of the crowd. Tessier, on the Werner bicycle, won easily, however, from Adeock, Blaker securing third place.

TRACTION ENGINE OR MOTOR-LORRY.

In the Aberdeen Justice of Peace Court ex-Baillies Archibald Mackenzie and Sangster and Messrs. Hugh Cowan and John Johnston on the bench, the Speedwell Motor-Car and Cycle Company, Ltd., Aberdeen, for whom the secretary of the Company, William Hendry, appeared, were charged with having on 5th April, driven a locomotive propelled by steam, and a loaded wagon on which it was erected, and a loaded wagon

attached thereto, along Hutcheon Street West, and with having, on the 11th April, driven the locomotive and wagons along Rosemount Place, with only two persons in charge, instead of three. Mr. E. Rennet, advocate, appeared for the company, and the Procurator-Fiscal prosecuted. A large number of witnesses were examined, and their evidence went to show that at times the vehicle did emit smoke and vapour, which would bring it under the Locomotives Act. For the defence it was contended that no smoke or vapour was emitted unless from some accidental or temporary cause, which was allowed light locomotives under the bye-laws. It was also contended that the engine was not drawing two vehicles, as the car on which it was set could not be looked at as a separate vehicle any more than a tender was separate from an engine. The bench, after consideration, said they had come to the conclusion that both as regards the emission of smoke or vapour from the engine, and on the question of having two vehicles instead of one they were of opinion that the machine must come under the Locomotive Act. They therefore found the charge proven, but as this was the first offence of the kind, they restricted the penalty to £2 2s. The driver of the vehicle, Donald Donaldson, was also charged with having driven the machine, but the Fiscal said he would depart from this case, as it depended on the first one.

M. SERPOLLET has just been over the Paris-Berlin route on one of his steam cars, as a kind of preparation for the forthcoming race.

THE English entries in the Paris-Berlin race so far are—the Hon. C. S. Rolls, Count Zborowski, Mr. S. F. Edge, and Mr. C. Jarrott, the last-named being entered to ride a motor-cycle.

THE Crawford Gear Company, Ltd., has been registered with a capital of £1,000 to adopt an agreement with M. Crawford, to carry on the business of engineers, motor, motor-cycle, and carriage manufacturers, etc. The registered office is at Holbrooks Lane, Foleshill, Coventry.

AMERICAN motorists are in a pleasant flutter of anticipation just now. A few weeks ago President McKinley was seen on a motor-car, driven by a young lady, not altogether unknown at White House. It was observed on that occasion that Mr. McKinley was the victim of violent emotion, and his conversion to automobilism is now looked upon as assured.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, JUNE 15, 1901.

[No. 119.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THAT constructors of electric vehicles are not standing still is evidenced by the two long-distance runs that have just been made, and it is satisfactory to find that a British firm has secured the record. M. Krieger, on a car of his own construction, drove one day last week from Paris to Mantes and back—a distance of 144.90 kils., or 89 miles—in 6 hrs. 47 mins. 21 secs., on a single charge. A battery of forty-four Fulmen accumulators weighing 783lbs. was used. This new record was not allowed to stand long, however, for on Tuesday last the

British and Foreign Electrical Vehicle Company, Ltd., submitted one of their cars to a long-distance test. Leaving Westminster Bridge in the morning, a run was made to Reading and back to the Automobile Club in Whitehall Court. There being still a supply of electrical energy in the battery, the run was continued to Balham, the total distance run on one charge of the battery—which is of a new type—being 94½ miles. The time occupied was about eight hours, but it must not be forgotten that a good portion of the run was through heavy traffic, a strong head-wind being also encountered on the outward journey. The British and Foreign Company are naturally very proud of the achievement, but we believe that they will not be happy until they touch the 100 miles on one charge.

Mails by Motor-Car.

AN experiment was successfully made on Monday by the Liverpool postal officials in carrying the mails between that city and Southport by motor-vehicles. At last week's trials the representatives of the Post Office were greatly impressed with the utility of the motor-carriages for road work, and it was decided that further experiments should be conducted to test the value of the vehicles for mail-carrying purposes. Accordingly the Milnes petrol motor-lorry (A2 of the trials) was requisitioned, and a start made at 4.30 a.m. on Monday. Mr. F. Salisbury, Postmaster of Liverpool, rode on the lorry while Mr. E. Shrapnell Smith and Mr. E. A. Rosenheim rode alongside on the former's Ariel quad. Southport was safely reached, and the Liverpool Postmaster is reporting to the G.P.O. headquarters in London on the result of the trial.

The Numbering of Motor-Cars.

At the last meeting of the Berks and Oxon Chamber of Agriculture, Mr. W. J. Henman opened a discussion with reference to motor-cars. He thought some steps should be taken to have the vehicles numbered and their speed restricted. He had seen motor-cars come down Moulshod Hill at twenty miles an hour, and some day there would be an accident, and, with no number on the car, there would be no means of finding out the name of the driver or owner. He also thought there

should be some restriction to compel them to slow down when meeting conveyances. At present they shot by before anyone was hardly aware of their approach. Mr. Henman gave notice that he would bring the matter forward again at the next meeting, and the secretary was instructed to put it on the agenda.

The Motor-Car Service for Reading.

WE have already mentioned that Reading and district are to be provided with a public service of motor-cars. At the last meeting of the Caversham Urban District Council, the Reading and District Motor-Car Company applied for licences for six motor-cars to ply for hire in Caversham. The Chairman said that he had received complaints about the speed of the cars in the streets of Caversham. He moved that the Clerk be instructed to make a formal complaint to the police with reference to the matter. Mr. Parfitt remarked that they had heard of few accidents, and he should be sorry, as a member of the Council, to put difficulties in the way of using the cars. They were marvellously controlled, and, although the speed might be somewhat high, the danger was infinitesimal. Unless they had good grounds for it he would be sorry to see the Council take the first or any steps unnecessarily. He did not think the legal speed was exceeded, although it was difficult to tell. Mr. Fidler considered they should encourage every means of communication between Caversham and Reading. Mr. Allwright seconded the Chairman's resolution, and observed that it was time to put the nuisance down. The resolution was then put and passed. The licences were, however, all granted.

Motor-Cars as Remounts.

DURING a recent debate on Army Estimates Mr. Louis Sinclair made the suggestion that motor-cars should be used as remounts. For £80 a small motor-car could be obtained, capable of carrying two men and a small gun much longer distances than horses. Motor-vehicles were greatly used in the armies abroad, and, he predicted, would be an important factor in future warfare. On horseback, argued the hon. member, a man could be shot down rapidly, but he would not be so liable to be sniped on a motor-car. Lord Stanley replied that the whole question of motor-cars for transport service was being gone into. The spectacle of a regiment of motor-cars would be inspiring, but he thought it was one we should never see. Lord Stanley may be right—neither he nor the *present* generation may see such a spectacle, but posterity will.

Helps to Horticulturalists.

WE had just read an article in the *Gardeners' Magazine*, declaring that the possibilities of the motor-car in commercial horticulture are very great, when we visited one of the best known nurseries in Surrey and found a notice, "Dogs, perambulators, bicycles, and motor-cars are not allowed in these grounds." Such a statement was not encouraging until we learned that some motor tricyclists and others had gone on tours of inspection among the flowers on their machines, and had

not always kept to the beaten paths. Seriously, however, the same qualities that are rendering the automobile useful to the market gardener will make it indispensable to the horticulturist of the future who seeks a market for his produce in the nearest town. The competition of English-grown with foreign flowers in London, mainly due to increased railway facilities, should be brought within measurable and reasonable limits by the motor-car.

Motor-Cars in Workhouses.

ONE of the problems that ever presents itself to Boards of Guardians is that of securing easy access to fresh air on the part of the infants. At West Ham a perambulator to carry twelve juveniles has just been purchased, and at Mutford, in Norfolk, a motion to supply two smaller vehicles has been lost. In the course of the discussion a motor-car was suggested by one facetious guardian, which, we are glad to see, was not adopted. Norfolk has yet to wear down a great deal of prejudice against the motor-car, and the presence of such a vehicle in a workhouse yard would have caused much pious horror in the county. At the same time, it would have emphasised the universality of the automobile, for, had the suggestion been adopted, we should have had both the Union and the Palace in one county acknowledging the merits of the motor-car.

Curious Police Ac- tion in the City.

THE case of Mr. L. Sinclair, M.P. for Romford, is one that ought not to be lightly forgotten, and one which should be investigated by all interested in the development of motoring as a pastime. Mr. Sinclair was summoned before the magistrates. The police alleged that he was driving furiously through the City. After hearing the evidence the summons was dismissed by Alderman Sir Marcus Samuel, and everyone thought that was the end of the case. But according to a letter which Mr. Sinclair has addressed to several of his constituents that is not so. The constables who gave evidence contradictory to Mr. Sinclair's statements have been granted additional holidays by Sir Henry Smith, the City Police Commissioner, who, when written to on the subject, said he had held an exhaustive inquiry and had arrived at a different conclusion to that reached by the magistrates. To be consistent the Commissioner should have hauled the M.P. into one of the dungeons of the Tower, and probably had he lived a couple of centuries ago some such fate would have been his. The matter is noteworthy as opening up the possibility of policemen regarding the proceedings as justifying them in persecuting motorists. Surely the better course would have been to have acknowledged the decision of the magistrates, and not to have shown a want of discipline by subsequent inquiry. Mr. Sinclair asks what effect this will have on the police. They will naturally say, he adds, "If we get the magistrate to convict, well and good. If not, why the Commissioner will reward us; so we are all right anyway."

Nottingham Automobilists.

ON Thursday, the 6th inst., the Nottingham and Notts Automobile Club paid a visit to Ringwood Hall, Brimington, the residence of Miss Bayley, sister of Mr. Thomas Bayley, M.P. for Chesterfield. Mr. Bayley, who is also vice-president of the Club, joined his sister in welcoming the visitors who, to the number of about fifty, made the journey via Mansfield in eleven cars of varying descriptions. The start was made about three o'clock, and the thirty miles were accomplished in a little over two hours. The condition of the cars and passengers on arrival at Ringwood testified to the dustiness of the roads. The party included Mr. and Mrs. Coken, Mr. and Mrs. Wells, Mr. and Mrs. Watts, Mr. and Mrs. Percy Huskinson, Mr. and Mrs. Rimmington, Mr. W. Knowles (president of the Club), Mr. Burton and Dr. Hogarth, and Mr. Cutts. After tea and a rest, the return journey was commenced shortly before seven o'clock.

An "Opportune" Moment.

"DOGBERRY," one of the best known contributors to the *City Press*, declares that "each day seems to witness an increase in the number of motor-cars used for commercial purposes." And then having recognised what is perfectly obvious to all who have occasion to travel in our large towns, he goes on to observe that "the moment is therefore opportune for suggesting the advisability of regulations for their control being drawn up by the authorities." This is almost identical with the attitude of the early days of last century, when the authorities regulated the new industry to such an extent as to seriously retard any chance of its progress for a number of years. Just when they are coming into prominence seems to be regarded by some people as the proper time to work destruction on new ideas.

Arrested for Furious Driving.

MR. S. F. BEEVOR was summoned at the Marylebone Police Court on Friday last week, June 7th, for driving at too great a speed having regard to the traffic on the highway. Mr. and Mrs. Beevor were driving from Maidenhead, and the constable stated that as he drove down Pembridge Road he was going three times faster than the ordinary traffic and collided with a hansom cab causing injury to it. The constable insisted on arresting him and taking him to the police station, leaving Mrs. Beevor sitting on the car in the road. He was, however, soon released. Mr. Staplee Firth defended. Mr. Plowden, the magistrate who tried the case, dismissed the charge, and in dealing with the unjustifiable arrest by the policeman stated that he was sorry that Mr. Beevor had been placed in such an unpleasant predicament. The constable had no right to act as he had, and he hoped Mr. Beevor would forget this unpleasant incident.

Unfair Methods— or What?

THE friendly attitude of the "powers that be" at Southsea towards automobilists is well known, and it is the more to be regretted that the police should resort to underhand methods against supposed infringers of the law, unless indeed there is another explanation of the following occurrences. A well-known sportsman and motorist was driving along the front on Friday last week, in a venerable car of his which is not exactly qualified for a Gordon-Bennett defender, and on returning to his coach-house was confronted by a couple of men in plain clothes who accused him of driving furiously, and whose want of courtesy seems to have nearly led to a breach of the peace. On being challenged to show that they were constables they would not or could not do so, and the automobilist, whose name and address were well known, dismissed them with the advice that they had better summons him. As another and faster car, of a similar colour to his, had been seen also indulging in an evening promenade, he thought it possible that it was a case of mistaken identity, as his vehicle could hardly have been fairly accused of excessive speed. The next evening, however, a local cycle agent was the victim of similar threats from, apparently, the same men, whose assertion that they were police he allowed to pass without question. If this sort of thing is permitted, it is within the power of any malicious person to annoy automobilists by tricks of the same kind, without the latter having any means of knowing whether or no he is the subject of a practical joke.

The Kentish Motor- Car Service.

A GREAT deal of attention has been drawn to the Kentish motor-car service successfully inaugurated between London and Tunbridge Wells last week. Distressed agriculturists throughout the Home Counties are anticipating big things in the near future, and now that the service is a *fait accompli*, congratulations are pouring in from all quarters. Perhaps the most valuable of these is a letter from Sir David Salomons, a director of the South-Eastern Railway Company, who has for long advocated the employment of motor-cars as a

means of rapidly delivering light and perishable goods. From the tone of Sir David's letter it seems that a railway company derives no profit from short-distance goods traffic, therefore there is little fear of an all-round lowering of rates as a means of keeping the motor-car out of the running.

Horse Dangers at Guildford.

MESSRS. DENNIS BROS., of Guildford, were very busy on Saturday, as was also Mr. F. Ostler, whose premises are only a few yards from the "Speed King" factory, in the windows of which a photograph of the arena at the Motor-Car Exhibition is a popular attraction. Guildford people, writes a contributor of the *Motor-Car Journal*, who has just spent some time in the town, are well accustomed to the motor-car, thanks to the geographical position of the town as well as its pleasant location and the frequent tours down its steep main street which have been organised by the Automobile Club. In fact, the horse-drawn vehicle is acknowledged to be more dangerous in such a district. One day last week a serious accident happened to the four-horse parcels coach, which would have been impossible had a motor-car been employed. When descending a steep hill one of the horses

have been accustomed to linger when the horse-drawn vehicle comes upon them and have not yet realised the new conditions. But the educational process is going on with birds—as it is with horses and their drivers.

Lightning's Latest.

OF all the newspaper comments on the French races none have been so absurd as those of our quick-witted contemporary *Lightning*, which, under the heading of "Electric Automobile Notes," gives many weary lines of attempted strong writing with a view apparently of filling space and appearing critical. *Lightning's* young man was reminded by the Paris-Bordeaux race of the nursery rhyme of "The ten little nigger boys"—a fact which leads us to suppose the writer must be younger than was commonly supposed. The Automobile Club is asked to assist the trade in the conveyance of fruit and dairy produce "instead of the continual organising of competitions for the benefit of councillors." Really we had hoped that the time had gone when such insipid vapouring would have been found in the columns of a technical journal. Just fancy *Lightning* deploring speed on the highway!

AN AUTOMOBILE PICNIC AT BLYDI, ALGERIA.

fell, with the result that the coach was sharply directed towards the gutter and overturned. Fortunately, the driver escaped serious injury, but the guard was considerably bruised and the horse was killed. The dangers of horse-drawn vehicles have been adequately proved during the Epsom week, and, as the *Westminster Gazette* remarks, "There is always more or less danger lurking in the use of the char-à-banc"—a fact proved in two or three dreadful incidents on the road to Epsom.

The Paris-Bordeaux Race.

ELSEWHERE we give some interesting extracts from comments by contemporaries on the recent great race. These are chiefly valuable as being the testimony of the leaders of public opinion in the provinces with regard to speed and safety being combined, and show very clearly that the conversion of every thinking man is only a matter of time. Much has been made of the remains of several small birds found on the front of some of the cars, one competitor explaining that he overtook some small birds pecking corn in the road and the automobile was upon them ere they had risen far from the ground. We remember similar experiences on the first day of the 1,000-mile Trial in this country, and have often noticed that birds in the road frequently misjudge the speed of the motor-car. They

Work for Surrey Police.

MOTORISTS in Surrey have to be careful just now, for the police are on the prowl seeking whom they can imagine is going at an accelerated pace. The pity is they did not exercise more supervision of the traffic on the roads at Epsom during the race week. Throughout the summer, too, parties of beanfeasters and trippers generally will be straining the pace and the tempers of horses to the utmost, and we should like to hear that cruelty had been stopped, so far as these poor animals are concerned. That would be better than annoying motorists who are still subject to much of the suspicion with which the railway was regarded some years ago.

Safer than Horses.

ALTHOUGH we do not expect to be believed by the world at large, we venture to state our firm conviction that the distressing accident which cast its shadow over Derby week could not have happened had the unfortunate char-à-banc been propelled by a motor. A motor-car does not bolt, or take fright, as do horses. It is, moreover, usually provided with three brakes, and not with one only, which too frequently causes a swerving movement trying to the nerves of a restive horse

Further, if by any chance every brake refuses to act it is always possible to turn a motor-car against such an obstacle as a ditch or bank before a dangerous rate of speed is developed.

The Scottish Automobile Club.

A MEETING of gentlemen interested in automobilism was held on Tuesday afternoon in Glasgow, for the purpose of inaugurating a Glasgow and West of Scotland section of the Scottish Automobile Club. There were about thirty gentlemen present; the Right. Hon. J. H. A. Macdonald, K.C.B., Lord Justice Clerk of Scotland, presiding. Mr. Norman D. Macdonald moved, "That a Glasgow and West of Scotland section of the Scottish Automobile Club be formed forthwith." Having explained that the Club existed for organisation, information, advice, assistance, and protection, he said the work of the Club in the past had been to some extent of a social character. There were also things of interest which had taken place behind the scenes, such as had occurred recently in Edinburgh, in which the Club had shown itself to be of use in a very practical way. The authorities there had framed an obnoxious set of clauses in a Bill whereby, by advertising two notices covering twenty-four hours each, they could cause any class of traffic to be stopped in any street in the city, or any class of traffic to go at a certain speed, and various regulations of that sort. The Automobile Club took up the matter, and brought pressure to bear upon the Lord Advocate and the Secretary for Scotland, so that when the Bill came up before the House it was then found that the Secretary for Scotland had insisted upon the insertion of a clause making the period of notice sufficiently long to allow of any objections being lodged and argued before the Sheriff. By taking such important action, the Club were seeking to conserve and look after the liberty of the subject. Mr. H. N. Napier, shipbuilder, seconded. He urged that the Club should not countenance fast running along the streets and roads. Automobilism was a good thing: it had come to stay, and ought to be encouraged in Glasgow. The Chairman, in supporting the resolution, said the principle upon which they were proceeding, and which they were urging upon Glasgow automobilists, was a principle of decentralisation. Speaking upon the general question of automobilism, his lordship said the movement was rapidly progressing. Perhaps it had not progressed in Scotland as speedily as it might have done. He hoped that the members of the Club would conduct their proceedings on the highways reasonably and sensibly. He did not suggest for a moment that it was sensible to suppose they were going to drive only at the rate of nine miles an hour, yet he did not wish to see men with enormous goggles and black half-masks upon their faces tearing along in a cloud of dust through which you could not see an inch of road for a distance of seventy or eighty yards. That was not reasonable. If their proceedings were conducted reasonably, all the fears of the general public would rapidly disappear. Mr. J. R. Nisbet moved, and Mr. James Burns, Motherwell, seconded, the appointment of the following gentlemen to act as the first Committee, with powers to add to their numbers, and to elect for the first year the representatives to Council and other representative bodies:—Messrs. James Burns, J. B. Talbot Crosbie, Wm. Kingsbury, D. McColl, Henry M. Napier, John R. Nisbet, Robert J. Smith, A. W. Steven, P. Stirling, and Thomas Syminton.

The Effect of Artificial Restrictions.

THERE are few arts or sciences the progress of which is not, in one way or another, impeded by artificial restrictions, but it is nevertheless true that these are sometimes the unintended source of certain compensations. The speed limits on French railways have been the cause of the development of express locomotives which surpass those of this country on up grades: while the three-ton limit for motor vehicles has undoubtedly stimulated improvement in construction and material; and to the limit—though this cannot be classed among artificial ones—of the "motor" of an ordinary bicycle to 1.6 h.p., must be attributed its marvellous lightness and efficiency, an

indirect evidence of which is the curious fact that the motor-cycle, its mechanical descendant, is the only rival in speed to the heavy racing car. No benefit, it is true, can be attributed to our own universally-observed speed limit; but the proposed limitation of racing cars by the A.C.F. to 18 cwt. should do much to encourage improvement in constructional design, and the reduction of the ratio of dead weight to useful load. In a motor-bicycle, it may be remarked, capable of about 25 miles an hour, this ratio is 2.3 approximately; in an ordinary light car it may vary from 3 to 6, and in a 30 h.p. racer it is nearer 12 or 14.

IMPORTANT TRADE MEETING.

ON Tuesday last, at the Automobile Club, Mr. Roger Wallace, K.C., took the chair at a meeting called together to consult upon the future of exhibitions. The meeting was on this occasion restricted to manufacturers and agents of whole cars. It was fully representative of this most important section of the trade, confirmed all the resolutions of a previous meeting, adjourned from May 21st, and went still further, practically tabooing all projected exhibitions, otherwise than the one to be held annually at the Agricultural Hall, under the supervision of the Club, and management of Mr. C. Cordingley.

On the first resolution, proposed by Mr. W. H. Astell, being put to the meeting, it was carried unanimously, "That manufacturers and agents of motor-cars here present recognise that the Automobile Club held the first purely Automobile Exhibition in this country; has been, and is, the recognised authority to hold trials of motor-vehicles and to give certificates in connection therewith, and has rendered, and is rendering, invaluable services to the automobile movement in this country. They therefore consider the Automobile Club is the proper authority to supervise exhibitions in this country, and seek that the Club should continue that supervision."

The second resolution, proposed by Sir Edward Jenkinson, "That the manufacturers and agents here represented are of opinion that there should only be one exhibition of automobiles in London or about per year," was carried with equal unanimity.

Mr. J. J. Mann's third resolution, "That there shall be only one exhibition per annum; that it shall be under the same management as the recent exhibition; that it shall be at the Agricultural Hall at the same time approximately as the recent exhibition, and under the control of the Automobile Club," met with the same cordial reception.

So far, the meeting had only gone over old ground. A fourth resolution, also proposed by Mr. J. J. Mann, and carried, was, "That a circular letter be issued by the Automobile Club to manufacturers and agents, enclosing a printed letter to be signed by each individual firm or agent, declaring that they will not exhibit at any exhibition in London or within twenty miles of Charing Cross which is not recognised by the Automobile Club. This agreement to hold good until the end of 1903. The exhibition space of the Automobile Club Exhibition to be open only to those who sign the agreement above named."

To guard against the remote contingency of back-sliding, Mr. Simms proposed as a fifth resolution, "That the Automobile Club shall have the right to refuse space at their exhibitions to all who have exhibited automobiles or their parts at any exhibition within twenty miles of Charing Cross, which is not recognised by the Automobile Club," which was also carried.

Mr. Shrapnell Smith, who called attention to the fact that provincial shows were not covered by the above resolutions, proposed as a sixth, which was carried, "That the Automobile Club withholds its patronage from motor-car exhibitions held in other parts of the country, not within twenty miles of Charing Cross, unless such exhibitions are held under the auspices of the local centre of the Club."

A discussion followed as to the position of manufacturers who had signed contracts to appear at other exhibitions. No one, however, seemed willing to admit this, till, amidst much laughter, a gentleman confessed to having done so—on April 1st. Encouraged by this open confession two other gentlemen owned up to having booked space elsewhere—provisionally.

The Automobile Club and County Councils.

DEMONSTRATIONS IN LONDON.

A GREAT upheaval of their prepossessions on the subject of motor-car control is what a number of British County Councillors must have experienced last week. Indeed, they made open confession, many of them, that such was actually the case, after they had taken part in the mammoth demonstrations which had been so long maturing, and which the Automobile Club brought to so triumphant an issue on Thursday, Friday, and Saturday, the 6th, 7th, and 8th of June.

So far as human agencies could ensure success, everything that was possible had been done in the way of previous arrangements, and the sole remaining factors that were at all uncertain were a continuance of the fine weather, and the presence of the County Councillors themselves. In neither respect was any disappointment forthcoming. The weather was glorious; the Councillors came forth in considerable array.

One could have wished for even more, it is true; but over 250 were appointed to seats on cars, and in the majority of

visitors had not much difficulty in discovering their allotted seats.

First to arrive on the scene were the 12 h.p. Panhard and 6 h.p. Daimler of Mr. R. W. Hudson, the former being the once famous car which led the van throughout the 1,000-Mile Trial, under the masterly control of the Hon. C. S. Rolls. Only thirteen months have elapsed since that historic event, yet what changes have taken place in English automobilism! This particular 12 h.p. Panhard is not only one of many now in use in this country, but all alike have ceased to be regarded as of exceptional power, considering the fact that cars of sixteen, twenty-four, and even fifty horse power have been built in English factories, to say nothing of recent importations as well.

The next car up was peculiarly noteworthy, not only by reason of its distinguished ownership, but because of its being the first of its type to be seen on the road. This was a Panhard *voiture légère* of seven, not five, horse power, and it belonged to

THE START FROM THE AUTOMOBILE CLUB.

[Argent Archer.

cases they faced the music. There were some who came without standing in any need of conversion towards automobilism, to which their sympathies had already been accorded; but there is no manner of doubt that the majority of the assembled Councillors had come in at least an apathetic, and in some cases a hostile, spirit, and it is with gratification, therefore, that one is able to record a complete change of front in practically every case before the week was over.

FIRST DAY.

Whitehall Court and the Horse Guards Avenue began to be busy by ten o'clock on Thursday morning, when a squad of District Messenger boys marched out of the Automobile Club and took up their positions along the kerb, their mission being to stand with uplifted poles bearing placards indicating the positions of the cars in intervals of ten. The intermediate numbers were also chalked along the pavement, so that no County Councillor stood in any quandary as to the whereabouts of his car, provided only that it turned up in due time. Some confusion necessarily arose in cases where a driver was unpunctual, or failed wholly to appear, but, on the whole, the

the Earl of Carnarvon, one of the first of our prominent sportsmen to take kindly to the new pastime. Painted in French grey and nicely finished throughout, the little car presented a most elegant appearance, its comparatively roomy tonneau being a welcome departure from the abbreviated types familiar on the various single-cylinder voiturettes.

Mr. W. J. Peall drove up on his well-known 6½ h.p. Daimler, and then came a fine 12 h.p. Daimler belonging to Mr. J. Lindsay Scott. Yet another Daimler, the 6½ h.p. of Mr. Herbert W. Lewin, followed, and then came Mr. Charles F. Torrey's 8 h.p. Peugeot. The next car to appear on the scene was one of imposing appearance, with most unusual carrying capacity; in fact, it was practically a bus with the top off, but without any suggestion of unwieldiness, or, indeed, aught but exceeding comfort. This was the new 12 h.p. Daimler of Mr. T. R. B. Elliott, and attracted much attention.

The air was now resonant with "teuf-teufs," and cars rolled up in quick succession. A 6 h.p. Motor Manufacturing was followed by Earl Russell's 7 h.p. Napier-Panhard, and then came the old reliable 6 h.p. Daimler of Mr. H. H. L. Lewis, a car which carried 300 voters to the poll for Mr. Mark Mayhew

at the last London County Council election. Two smart little cars from the Roadway Autocar Company—a 6 h.p. Mors and a 4½ h.p. Renault—then enlivened the scene, after which the snow-white Krieger electric car of the British and Foreign Electrical Vehicle Company glided gracefully into its place.

Mr. Alfred Bird next drove up on his plum-coloured 12 h.p. Panhard, followed by the well-known 7 h.p. Daimler of Mr. Ernest Estcourt. A car seen by many for the first time was the 5 h.p. Wilson, driven by its designer, Mr. Walter G. Wilson, which interested the *cognoscenti* by the extraordinary silence of its gearing. The vehicle, however, which was the cynosure of most observers was the new 12 h.p. Serpollet of Mr. Alfred Harmsworth, driven by Lancaster, his *mécanicien-in-chief*. The car was fitted with a landau body, and, being very lofty, presented a quite unusual appearance. Its burners gave a curious roaring sound as it stood, like the blast of a small furnace, and occasional puffs of smoke were visible from the same source.

The handsome 12 h.p. Panhard of Mr. Harmsworth was also placed at the disposal of the County Councillors, as also was the big 24 h.p. Daimler of the Hon. John Scott Montagu, M.P., piloted by its owner. Mr. Roger W. Wallace, K.C., the Chairman of the Automobile Club, drove up in a smart-looking red and black Motor Manufacturing car of 7 h.p.; Mr. T. B. Browne brought his 6 h.p. Panhard, another car which braved the ordeals of the 1,000-Mile Trial; Mr. Percy Richardson's 6 h.p. Daimler was another familiar object, as also was the powerful 19 h.p. Daimler of Mr. J. R. Hargreaves, J.P., which—whisper it not in the ears of scandalised anti-automobilists—he had driven all the way from Norwich that very morning! The white and red 12 h.p. Panhard which Sir Hickman Bacon, the premier baronet of England, has lately acquired from Mr. Lazenby was also on the ground, its wings having been clipped to the extent of a reduction of its sprocket teeth from 19 to 13 since the transference.

Most interesting of all, however, from one point of view, was the little 5 h.p. Renault of Miss Vera Butler, which Mr. Frank Butler drove up at a smart pace, and pulled up and turned in its tracks to the visible amazement of County Councillors who were hard by. The fact that this car had been driven from the north of France to the Riviera and back without a solitary mishap, and by a young lady, speaks volumes for the efficiency of even small automobiles; and if actual records like this were only more widely known, we should hear far less of the popular but fallacious theories as to break-downs than is at present the case.

But we have not by any means exhausted the list of cars which put in an appearance. In addition to the foregoing there were Mr. Rendle's 6 h.p. Daimler, until recently the property of Mr. E. Manville—the car which Mr. Pitman drove through the 1,000-Mile Trial; Mr. Henry Edmunds's 9 h.p. Daimler "Antrona"; Mr. Roger H. Fuller's 4½ h.p. De Dion phaeton, with an awning; Mr. W. M. Hodges's 6 h.p. London Motor Company's Daimler; Mr. Granville M. Kenyon's 6 h.p. Darracq; Mr. Charles Threlfall's 6 h.p. Daimler; Mr. Fred. A. Rodewald's 6 h.p. New Orleans; Mr. W. H. Astell's 7 h.p. New Orleans; Mr. Thomas Wood's 4 h.p. Locomobile; Mr. J. H. Adams's 8 h.p. Canello-Dürkopp, driven by the Rev. Arundell Whatton; Mr. C. N. Williamson's 7 h.p. Orient Express, driven by Dr. E. E. Lehweß; Mr. Edwin Midgley's 5½ h.p. Gladiator; a 4½ h.p. Humber; Mr. F. N. Horne's 7 h.p. Parisian Daimler; Mr. H. E. Hooper's 8 h.p. Panhard; Mr. A. Carlsh's 8 h.p. Georges Richard; Mr. J. C. Layng's 3½ h.p. International; Mr. C. Cordingley's 6 h.p. M.C.C. Panhard; Mr. G. Souther's 3 h.p. Benz; Mr. H. F. Englehardt's 6 h.p. M.C.C. Iveagh phaeton; Mr. L. A. T. Johnson's 9 h.p. Benz; Mr. Herbert St. Smith's 6 h.p. Panhard; Mr. G. Cornwallis-West's 8 h.p. Panhard; Mr. H. L. Kosh's 6 h.p. Daimler; Dr. C. Whitehall Cooke's 3 h.p. New Orleans; Mr. Clement Braby's 4½ h.p. De Dion; Mr. C. W. Mitchell's 12 h.p. Panhard; and Mr. A. G. Sharpe's 5 h.p. Locomobile.

It is hardly necessary to remark that the vehicles above enumerated constituted a very fine display of up-to-date automobiles, and it goes without saying that their presence in such force formed a very interesting sight.

The following were the gentlemen who had accepted invitations for the opening day:—Colonel W. Gwynne-Hughes, the Earl of Wharnccliffe, Lord Llangattock, Mr. W. Franks, Colonel G. B. Hobart, Major D. C. Budd, Mr. H. R. D'A. Willis, Lord Glanusk, Rev. St. A. H. Molesworth St. Aubyn, Captain Clarke, Major S. N. Thompson, Mr. T. Davies, Mr. J. Monks, Mr. H. Bradford, Mr. W. Bean, Alderman J. Joseph, J.P., Mr. Owen Thomas, Mr. Collingwood Hope, Colonel J. Baskerville, Colonel G. H. C. Beisiegel, Mr. E. R. James, Mr. Fairless-Humphreys, Mr. E. R. Trotman, Mr. Charles Bailey, Mr. C. H. Pedley, Mr. J. Straker, Mr. J. Blackham, Mr. J. Chettle, Mr. H. Dennis, Mr. J. H. Bullock, Mr. J. L. Greenway, Mr. T. B. Cope, Mr. C. Birchall, Mr. J. P. Coultas, Mr. C. D. Nicholson, Mr. James Wright, Mr. J. W. Smithies, Mr. Scott Barrett, Mr. Thomas Savage, Mr. J. D. James, Mr. Arthur Carkeek, Mr. Arthur Vernon, Mr. T. Horberry, Mr. W. W. B. Hulton, Mr. E. W. Gooch, Mr. C. H. C. Brady, Mr. G. G. Lewis, Mr. D. Davies, Colonel G. Dixon, Mr. Jno. W. Dingle, Dr. Thompson, Mr. A. C. Duncombe, Mr. Stanley Bligh, Mr. Edward Phillips, Sir J. Pender, Captain Fullarton Jones, Mr. W. Haworth, Mr. E. A. Taylor, Mr. F. C. Loder Symonds, Mr. Walker, Mr. H. S. Pyman, Mr. H. A. L. Francis, Mr. J. K. Bourne, Mr. A. G. Buckhardt-Ashton, Mr. Bingley, Mr. W. J. Payne, Mr. J. D. Cradock, Mr. F. M. Northen, Mr. G. R. Harris, Mr. O. H. Jones, Mr. T. N. F. Bardwell, Mr. W. E. Garnett-Botfield, Mr. Tonman Mosley, Mr. E. Hyde Greg, Mr. C. E. Shaw, M.P., Mr. J. Wright, Mr. T. Round, Mr. J. H. Watson, Mr. S. Farrow, Mr. A. Elwell, Mr. A. A. Spilman, Mr. W. H. Parkin, Mr. Robert Fox, Mr. B. A. Adam, Mr. C. B. Crawshaw, Mr. Duke Fox, Mr. B. T. Ringrose, Mr. J. Franklin-Hindle, Alderman Cockerill, Alderman Britten, Mr. G. Lawrence, Mr. A. R. Empson, Mr. H. Ellis, Mr. Bourne, Mr. Slater Harrison, Mr. Gwynne Holford, Mr. W. W. J. Mansbridge, Mr. Francis Meade, Mr. T. Dutfeld, Mr. W. Gething, Mr. J. W. Rowe, Mr. Geo. R. Dickens, Mr. Hy. Bonsall, Mr. Fairfax Lucy, Mr. R. Hollick, Mr. Sticking, Mr. Wm. Wilson, Mr. R. T. Richardson, Mr. W. A. Standing, and Mr. J. A. Wilson.

It is not practicable to give the county represented in each case by the foregoing gentlemen; no details having been furnished to that end, but it may be said of them collectively that they emanated from Berkshire, Carmarthenshire, Cardiganshire, Cheshire, Cornwall, Denbighshire, Flintshire, Glamorganshire, Lancashire, Lincolnshire, Merionethshire, Monmouthshire, Montgomeryshire, Northamptonshire, Nottinghamshire, Oxfordshire, Rutlandshire, Somersetshire, Staffordshire, Westmorland, Warwickshire, and Yorkshire. It will readily be seen that "gallant little Wales" was strongly represented on this the opening day's programme.

About a quarter past eleven Mr. Roger Wallace, whose car was "number one," was the first to move off, and gradually, but without any desire to form a procession, the other cars followed suit. It was left to the discretion of the individual drivers to choose their own route, and some of them drove their guests round Richmond Park, or elsewhere, before finishing at Sheen. By one o'clock, however, the lawn at Sheen House presented a truly animated spectacle, what with some sixty automobiles and scores of well-known *chauffeurs* and their County Council visitors.

Now, while it is impossible to speak for every unit in the gathering, and injudicious to assume that everybody was precisely of the same mind, this much may be said with emphasis, that not only were no signs of disapproval in the least degree apparent, but expressions of delight, commingled with surprise, seemed all but universal. It was clear that the ease with which the cars could be controlled, the celerity with which they could slip through traffic as compared with vehicles elongated by shafts, and the entire absence of alarm on the part of the

SNAP-SHOTS AT SHEEN HOUSE CLUB,

animals passed on the way, were nothing short of a revelation to those previously unacquainted with the *nuances* of automobile locomotion.

When the muster was complete a general adjournment was made to the large room, which at one time was used as a cycle showroom, but which now served excellently well as a dining-hall. Here Lord Llangattock presided over the numerous company of Councillors and their charioteers, and a "cold collation" was served. At the conclusion of the repast the toast of "The King" was of course proposed, and honoured with especial appropriateness and fervour from the fact that His Majesty is the most distinguished of *chauffeurs*. Then Lord Llangattock, whose kindly hospitality at his Monmouth seat last October will always be remembered by those who took part in the Club's autumn tour, extended a cordial welcome to the visitors, whom he congratulated upon the fact that their names would go down to history as of men who did not adopt the view that a new movement, because it was new, should be squashed without thought or consideration of its possible importance to the country. The movement, he said, was one which should give employment at high wages to thousands of our artisans, and provide rapid means of transport for agricultural produce and merchandise. [2]

DUKE OF NORTHUMBERLAND AND SIR ARTHUR ARNOLD WITH
MR. ROGER WALLACE, K.C.

[Argent Archer.

Then came an encouraging speech from Mr. C. E. Shaw, M.P., in support of the Chairman; after which it was the turn of the County Councillors. Alderman Joseph Joseph, J.P., Chairman of the Carmarthen County Council, responded to the toast of "The Visitors," and Colonel Geo. Dixon, Chairman of the Cheshire County Council, proposed "The Automobile Club," and wished it every success in its great work. He was strongly of opinion that the new industry should not be hampered in any way, and urged County Councillors to consider well their attitude towards automobiles. For himself, he saw no reason why they should not go at twenty or thirty miles an hour where a good view of the road ahead was to be obtained.

In his customary tactful manner Mr. Roger Wallace replied on behalf of the Club, and was glad to note that some of the Councillors were beginning to realise how the motor-car would open up districts that had hitherto been unknown. It only remained for county authorities to see that all the roads were good, and the motor-car would soon follow with plenty of visitors. A sympathetic speech was made by Alderman W. B. B. Hulton, a well-known member of the Lancashire County Council, in proposing the Chairman's health, in the course of which he made it clear that that important county

would not throw in its lot with the obstructives. One can remember the time when it used to be the Lancastrian's boast that "What Lancashire thinks to-day England thinks to-morrow." It is devoutly to be hoped that the apothegm may be justified anew.

Subsequently the County Councillors again took their seats in the cars, with an obvious anticipation of a pleasurable experience and an entire absence of the trepidation that some of them appeared to entertain before the outward journey. Some of the cars were driven straight to town, and others took more devious routes, according to the preferences of the guests.

SECOND DAY.

Friday morning again broke gloriously fine, with every prospect of another successful demonstration. The list of Councillors able to attend on that day was less numerous than on Thursday, and fewer cars, in consequence, were pressed into the service. Over thirty of those previously named, however, again turned up, and there were also several new arrivals. Prominent among these was the 12 h.p. Daimler of Mr. E. Manville, fresh from the factory at Coventry, and with a still unfinished body. The *tonneau* was exceedingly capacious, and the car should make an admirable touring vehicle. Mr. A. H. Howard brought his 5 h.p. Marshall, the back wheels of which he has fitted with Collier tyres of 120 millimetres diameter. So far they had given no trouble, and had been driven some six hundred miles. Another car which had not appeared on the first day was the 8 h.p. Motor Manufacturing car of Mr. C. A. Moreing, a nicely-finished vehicle with a particularly smart bonnet. Mr. Scott Montagu's big 24 h.p. Daimler, Mr. J. R. Hargreaves's 19 h.p. Daimler, and Mr. A. Harmsworth's Serpollet were again the most prominent of the assembled vehicles, and the Roadway Autocar Company's Renault turned up with a "Mylord" body, fitted in lieu of a *tonneau*, the occupant being a lady, who was well shielded from the dust.

Though less numerous, as we have said, the second day's list of visitors was still imposing. They were set down on the list as follows:—Col. G. Gascoyne, Sir H. Pelly, Mr. G. Manners, Mr. R. Elcock, Mr. A. O. Sillifant, Mr. M. Hulton-Harrop, Mr. E. A. Fooks, Mr. J. G. Wood, Mr. J. Bowen-Jones, Mr. J. W. Cripps, Mr. W. Failes, Mr. E. Powell-King, Mr. J. T. Homer, Mr. J. F. Symonds, Mr. S. Oldman, Mr. R. Kerrison, Mr. E. Dudley, Mr. Bentley-George, Mr. C. E. Hobhouse, Mr. M. B. Marshall, Major Carthew, Mr. W. Snell, Mr. W. Priestley, Mr. Courtenay F. Wilson, Mr. T. Ellis, Mr. E. Playne, Col. J. A. Austin, Mr. E. R. Pratt, Mr. J. W. Beeton, Mr. W. E. Baker, Mr. J. Lloyd Price, Mr. J. W. T. Tyler, Mr. W. Somers, Mr. J. Amphlett, Mr. E. B. Sparke, Mr. John Linton, Rev. J. Young, Mr. G. Fiske, Mr. Barham Carter, Mr. C. Manby, Colonel Goodden, Mr. G. W. Thompson, Mr. A. Dennis, and Sir William Vincent.

The counties from which these gentlemen hailed were Derbyshire, Dorsetshire, Gloucestershire, Hampshire, Herefordshire, Huntingdonshire, Norfolk, Shropshire, Suffolk, Wiltshire, and Worcestershire.

So far as we could gather—for, of course, the cars went singly down to Sheen—there was nothing to differentiate the drive down from that of the previous day. We have heard of no untoward incident whatever, and, happening to be one of the first to reach Sheen House, we were able to note, as on Thursday, the obvious delight, both spoken and unspoken, of the County Councillors as they arrived. They seemed more struck with the unconcern of the animals on the route than anything else, having no doubt heard already something of the wonderful controlling powers of the automobilist over his machine, but still entertaining supersensitive ideas as to the frightening of horses. Those notions had manifestly vanished into thin air, however, ere the ride was over.

The luncheon was presided over by Sir Edward Vincent, and his speech in welcoming the visitors was admirable in form

and matter alike. He remarked appositely enough that what they all hoped was that the County Councillors present would take advantage of the opportunity of seeing what automobilists could do, and they (the Councillors) would then be able to decide what automobilists ought to do. He laid strong stress on the good feeling that ought to be displayed by every automobilist, and said that if a motor-car was controlled by an experienced driver, whether professional or amateur, and if that driver was animated by the good feeling and consideration for others which had always characterised English gentlemen, then an automobile was absolutely no danger, and was not even a nuisance to others. The solution of the question was that cars should only be driven by those who were competent for the work. It was absolutely feasible to have the best and fastest cars in England, and to make full use of them, without being in the least degree a danger to the community at large. Then Sir Edward spoke with telling effect upon the absurdity of having laws which were in direct conflict with the good sense

Mr. John Bowen-Jones, J.P., Chairman of the Shropshire County Council, responded for the visitors, and said that he felt very strongly that no speed limit should be imposed. He admitted that the control a driver had over his car was much greater than he had supposed.

Mr. J. W. Beeton, of the Norfolk County Council, said that all the opposition to automobilists would be effaced in time. He would go back to his Council, and, when the opportunity occurred, support, if not move, that every restriction should be removed from the automobile pastime and the industries connected with it.

Sir William Vincent said that that day had witnessed his conversion. He would go back from his drive that day feeling that along the open roads there need be no limit of speed whatever.

Mr. A. Dennis, Dorset County Council, was of opinion that this was a question of forbearance all round. Common sense, mutual forbearance, and ordinary courtesies should

THE SCENE AT SHEEN HOUSE CLUB.

[Argent Archer.

of the public, and, therefore, liable to be neglected in the observance. Speaking from his own personal experience, he was absolutely convinced that there was no danger to traffic in going at 30 or 40 miles an hour along a broad straight road—and, he added, he spoke as an owner of many horses. As regards numbering, he could not believe that anything of that kind would be beneficial. Nothing satisfactory would be done unless the working of the law was facilitated by good feeling on all sides.

Then the Hon. John Scott-Montagu, M.P., supported the toast, and defined the policy of the Automobile Club as one of conciliation. He said how glad they were to see the County Councillors there, and hoped that the gathering would tend to spread among them a better knowledge of how motor-cars were controlled, and to help them realise that automobilists were not such "horrible beasts" as they had sometimes been represented.

be the things which were demanded on the road. They did not want restrictive legislation at all, and should rely upon the common law of the country instead of presenting special bye-laws to the legislature.

Colonel Goodden (Dorset) said that to treat every driver of a motor-car as a convict was a useless and irritating provision.

A Hampshire Councillor said that the time for numbering had not arrived. It was perfect folly to try to choke off a movement that must come. He spoke feelingly, because he drove a pony that invariably turned tail when it met a car, but he had rather submit to that than see a motor-car stopped.

Another Councillor, from Flintshire, testified to the way in which Wales was looking forward to the extension of the motor-car industry as their very salvation. They were handicapped by railway rates, and when the motor-car industry became general it would restore their country to what it was in the old coaching days.

Colonel Gascoyne (Derby) spoke against both speed restrictions and numbering proposals. He was sure that motor-cars were the vehicles of the future.

Mr. Roger Wallace made another able speech, and emphasised anew the fact that the common law should be sufficient for all purposes. A sportsmanlike feeling among drivers of cars would do far more than any regulation could ever accomplish.

After Alderman Kerrison, of the East Suffolk Council, had also spoken against a speed limit, the proceedings closed and the return to town was made as on the previous day.

THIRD DAY.

Splendid weather and another imposing array of cars were the dominant features at the opening of Saturday's proceedings. Nearly all the vehicles which had been in use on Thursday and Friday were on the ground, while several others made a first appearance. The Hon. C. S. Rolls drove an 8 h.p. Panhard, with *tonneau* body; Mr. Alfred Harmsworth sent a 6 h.p. Daimler; Mr. Henry Edmunds had his 1,000-Mile Trial car "Rhoda" as well as the "Antrona"; Mr. Ernest Pitman turned up on his new $7\frac{1}{2}$ h.p. Daimler phaeton, with yellow panels and grey under-frame, the car being noteworthy for its lengthy wheel base. Mr. T. Schlentheim brought down his new 12 h.p. Motor Manufacturing car, with wagonette body and a special spider seat behind; Mr. Ballin Hinde sent a red Panhard of 12 h.p., and also a 6 h.p. Benz; Mr. C. Friswell drove a 12 h.p. Gobron-Brillié; Mr. F. W. H. Hutchinson, a 10 h.p. Benz; Mr. Percy Richardson, a Kimberley dog-cart; Humbers, Ltd., sent one of their phaetons as well as the new $4\frac{1}{2}$ h.p. car previously in evidence; Mr. T. F. Toovey drove a $7\frac{1}{2}$ h.p. Peugeot, Mr. A. W. Heard a smart Century tandem, and Mr. P. McMahon a $3\frac{1}{2}$ h.p. Aster. Two cars were sent by the Locomobile Company, and Mr. R. E. Phillips drove a Mors Petit Duc. There was almost a rush for seats, but sufficient cars were in attendance to accommodate all the Councillors who had foregathered.

The Duke of Northumberland's was the first name on the list, which also included Lord Saltoun, Sir G. M. Grant, Lt.-Col. St. John, Mr. W. J. Bull, M.P.; Sir Arthur Arnold, Mr. A. Inskip, Mr. W. W. Marks, Commr. O. Young, Mr. J. Twinch, Mr. H. J. Johnston, Lt.-Col. J. Colquhoun, Mr. H. W. Tinne, Mr. H. J. Bristowe, Mr. W. Fox, Mr. W. H. B. Rosher, Mr. T. H. W. Idris, Mr. G. H. Radford, Mr. W. P. Warren, Mr. J. Edgell, Mr. T. Latham, Mr. A. W. Marshall, Mr. F. Jenkins, Mr. C. E. Grey, Mr. E. O. Fordham, Mr. J. Wicks, Mr. T. P. Brand, Mr. S. R. Ginn, Mr. W. W. Green, Mr. H. E. Brooks, Mr. D. Bower, Mr. H. Cumberland, Mr. C. Hayles, Mr. R. C. Lambert, Mr. G. A. Jeffery, Mr. M. Millard, and Mr. C. Soundy.

Among these Councillors and visitors the London County Council was strongly represented, and other counties which sent delegates were Bedfordshire, Berkshire, Buckinghamshire, Cambridgeshire, Essex, Hertfordshire, Kent, Leicestershire, Middlesex, Northumberland, Surrey, and Sussex.

When Mr. Roger Wallace, for the third time, led the way to Sheen, he must have felt that the Automobile Club had ensured itself a triumph. Everything had been fully satisfactory on the two preceding days, and the speeches at the lunch of Friday were particularly encouraging; it only remained to complete the rubber with a third success.

This the Club unquestionably achieved. The same easy run to Sheen House, with displays on every hand of the steering and stopping powers of the cars, the same facile passage through the traffic with such conspicuous adroitness as compared with the horse-drawn turnouts; the same unfeigned astonishment of the County Councillors who were taking their first automobile ride—all these features were repeated anew.

Better than ever, however, was the speaking after lunch. Post-prandial oratory, at night, is not always taken seriously, but there was nothing of the merely complimentary or platitudinarian about this after-luncheon oratory. For the most part it was incisive, logical, irrefutable, and if the County

Councillors had heard nothing but Earl Grey's testimony to the new movement the meeting would not have been in vain. What made his lordship's vigorous harangue so convincing was the obvious sincerity with which he set high store upon a movement to which, he frankly confesses, his personal interests were opposed, but the gathering force of which in common fairness he was unable to gainsay.

Earl Grey said that if all the County Councillors had been steered thither by half as efficient a coachman as he had been that morning they must have been convinced that there was no machine on wheels that was so wonderfully under the control of the driver as the motor-car. Though he did not own a motor-car, and had not been in one more than a dozen times, his common sense told him that there was no safer conveyance. He had joined the Automobile Club because he recognised that the great problem of the day was how to empty the towns of their population. Speedy locomotion was absolutely essential for that object. He was told that there was some idea abroad of legislation which would make it illegal to drive motor-cars at more than ten miles an hour. (Great laughter). All his personal interests were against motor-cars, for he was a breeder of horses, and the fortunate possessor of a shire stallion whose yearlings sold at £500. But he could not conceive anything so harmful to the true interests of this country as such restrictive legislation as would prevent men from going into what was now the sport of motor-car driving. If they made that sport difficult they would be killing an invention which would be in the future a blessing to the working-men of this country. A motor-car in the hands of an experienced driver could go very fast at very much less risk to people who used the roads than he could go in a dog-cart at six miles an hour. It was not a question of pace. Four miles an hour in traffic might be very dangerous; forty miles an hour on the road was a very safe one. Another point in favour of the motor-car was that it did not require a scavenger behind it. The wear and tear of the roads, too, was absolutely nil. He could not conceive any greater friend to the local rate-payer than the motor-car, if its uses were extended. It was a distinct danger to the future of this country that we were so awfully frightened of a new invention. They all loathed the bicycle at first. He had gone through the phase of hatred of the bicycle, and thinking everyone who used it a cad; now he had come to think that a free wheel bicycle was the poetry of motion. As time went on they would become so accustomed to the motor-car that they would regard it as a beautiful object, and be very sorry if they did not meet it when they went out for an afternoon walk. In conclusion, Earl Grey expressed a fervent wish that no restrictive legislation would be enacted against motor-cars.

The Duke of Northumberland said that all the visitors had been impressed with the power an automobilist had over his vehicle. His own belief was that motor-cars would be the great means of locomotion in the future, and that an enormous amount of goods and passenger traffic would be taken from the railways.

Sir Arthur Arnold made an entertaining speech in proposing the toast of the Automobile Club, and recalled an incident of how, when he was a young man, he was endeavouring to secure the introduction of gas into a certain township. A blind man arose and clinched the matter with the dictum, "Let those have lights as wants 'em;" and the proposal was rejected by an overwhelming majority. Sir Arthur predicted a great future for the automobile, and said that the London County Council was keenly interested in the subject and would do nothing to hamper the movement.

Mr. Roger Wallace was received with three cheers as he rose to respond. Once more he urged the importance of control and the efficiency of the driver, as compared with the unimportance of mere speed.

After a few words from Mr. Johnstone, the chairman of the Essex County Council, the speaking was closed, and after the "Biograph" had done its worst on the cars outside, the visitors returned to town. So ended a noteworthy and successful demonstration, a unique example of the triumph of a good cause over prejudice and useless opposition.

FLANEUR.

THE LIVERPOOL HEAVY MOTOR-VEHICLE TRIALS.

LAST week we brought our account of the heavy motor-vehicle trials organised by the Liverpool Self-Propelled Traffic Association up to the end of the proceedings on

C1	...	6 0 0	439	6 58
D1	...	4 1 24	338	5 46
D2	...	6 1 14	389	7 43
D3	Not arrived at 8.45 p.m.				
D4	...	7 2 14	415	5 39

Fine weather favoured the proceedings on Thursday, the 6th, when the destination was Blackburn, *via* Wigan and Chorley,

SNAP-SHOTS ON THE JOURNEY FROM LIVERPOOL TO MANCHESTER.

Wednesday, the 5th inst. The official returns of the day's run are appended:—

WEDNESDAY, JUNE 5TH.					
No. of car.	Coke used. cwt. qr. lbs.	Motor Spirit used. galls.	Water used.	Running Time. h. m.	
A1	...	53 (tank leaked)	In cooler ¼ pt.	6 35	
A2	...	31	In cooler ¼ pt.	5 47	
B1	4 2 4	...	277 gallons	7 14	

a distance of forty-one miles. The loads assigned to the competing vehicles were as follows:—

- A1. 1½ tons (50 cases) canned pears from R. Crook for Wm. Hindle, Blackburn.
- A2. 1½ tons salmon from Simpson, Roberts and Co., of Liverpool, for H. F. Whalley, of Blackburn.
- B1. 4 tons grain for Richard Shackleton and Son, Blackburn.
- C1. 6 tons (185 cases) canned goods from Richard B. Green and Co., Liverpool, for Wm. Hindle.
- D1. 4 tons grain for Richard Shackleton and Son.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

- D2. 4½ tons grain for Appleby and Sons.
 D3. 4 tons grain for Appleby and Sons.
 D4. 4½ tons grain for Appleby and Sons.

The start at George's Dock, Liverpool, was timed for 9.15 a.m., but it was ten o'clock ere all the vehicles got away. The route, after getting beyond the city boundaries at Old Swan, lay through Knotty Ash, and the level, well cultivated, and pleasant agricultural district comprising Knowsley estate. The roads traversed after passing the latter were largely of the rolling prairie order. The way in which the hills were for the most part negotiated by the loaded wagons was an agreeable contrast to what would have been experienced with horse-drawn wagons. Wigan was safely reached a little after schedule time, the vehicles drawing up in the market square to allow of a stop for lunch, the visitors being entertained by the Mayor and Mayoress of Wigan. At the luncheon Colonel Farrington proposed the prosperity of the Association, coupled with the names of the officers. The toast was responded to by Mr. Henry H. West, one of the Judges.

It was about three o'clock that a start was made for Chorley, where the Mayor was waiting to receive the party. The gradients are particularly severe between Wigan and Blackburn, and Botany Brow, rising out of Chorley, is an exceptionally stiff climb. Most of the passenger cars halted at the top of the hill, to see how the steam wagons took it. If their pace was sometimes slow, the wagons, however, kept moving. On reaching Blackburn we found the entire population had turned out to welcome us. The vehicles were driven to the Artillery Barracks, where they were stored for the night.

Appended is a table giving the official return for the day:—

No. of car.	Coke used. cwt. qr. lbs.	Motor Spirit used. galls.	Water used.	Running Time. h. m.
A1	1 pt. for cooler	7 49
A2	1 pt. for cooler	5 54
B1	283 gallons	7 3
C1	532 "	7 43
D1	347 "	7 5
D2	(see note)
D3	394 "	9 28
D4	398 "	6 13

The Coulthard vehicle D2, which carried 4½ tons of wheat, broke one of the axle springs, due, it was said, to the shifting of the load over to one side. The breakage was, however, repaired and, as will be seen below, the vehicle took part in the concluding run.

Friday witnessed the consummation of the trials. The concluding run was from Blackburn to Liverpool, by way of Preston, Ormskirk, and Rufford. The journey was one of the most successful of the week, the heavy vehicles doing some good performances. The wagons were again laden, the loads carried being:—

- A1. 1 ton 7 cwt. 2 qrs. machinery from Yates and Thompson.
 A2. 1½ tons ditto ditto.
 B1. 4 tons 8 cwt. 2 qrs. flour from H. T. Livesey and Sons.
 C1. 5 tons 3 cwt. machinery from Dickenson and Sons.
 D1. 3 tons 17 cwt. paper from the Star Paper Company.
 D2. 3 tons 4 cwt. 1 qr. 4 lbs. flour from Appleby and Son.
 D3. 3 tons 10 cwt. machinery on account Crossley Brothers, Limited, Manchester.
 D4. 4 tons 5 cwt. 2 qrs. 24 lbs. flour from Appleby and Son.

Blackburn was left about ten o'clock, and the route offered considerable difficulties in the way of hills, both in the first and the last stage of the journey. On leaving Blackburn there was a long and somewhat difficult slope to be encountered, but which the wagons ascended with comparative ease, to the admiration of the onlookers. Further along there was a stretch of some miles for the most part consisting of gentle declivity. Brockholes-brow, *alias* the Halfpenny Bridge-brow, however, presented the longest, and at the same time the steepest climb of the day. Between the motor-vehicles, cyclists, and the general crowd, the long slope was covered almost from top to bottom, and the climb was witnessed with great interest. The grade is given as 1 in 14, but in places it must be 1 in 8 or 9. It served as a good test of hill-climbing for the vehicles, and it is satisfactory to state that they all took the hill in fine style.

At the first stopping place, in the covered market at Preston, the arrival of the vehicles was awaited with very great interest by a vast crowd, and in the Town Hall the party was cordially welcomed by Alderman Pearson in the absence of the Mayor, owing to illness. Mr. Shrapnell Smith warmly expressed the thanks of the Liverpool Self-Propelled Traffic Association for the cordial reception extended to them, and for their co-operation in the movement, by arranging for water supplies, etc. Among voluntaries which joined in the procession at Preston were a self-propelled vehicle from Cox's Milling Company, the Liverpool Corporation's tramway store wagon, and a Coulthard vehicle from the Ramsgate Pure Ice Company.

From Preston on to Rufford there was opportunity for a capital spin on the part of the light cars, the roads being in splendid condition. At many points on the country roads were groups of villagers, who watched the passage of the motor-cars with much interest. At Rufford excellent fare was served at the Hesketh Arms; and after a stoppage of about an hour off went the vehicles to Liverpool, the George's Dock Sheds being reached in good time, the last car arriving by seven o'clock. Appended are the returns for Friday's run:—

No. of car.	Coke used. cwt. qr. lbs.	Motor Spirit used. galls.	Water used.	Running Time. h. m.
A1	...	5½ (tank still leaking slightly)	In cooler ½ pt.	6 28
A2	...	4	In cooler 1 pt.	6 3
B1	4 2 0	...	288 gallons	7 8
C1	7 0 0	...	455 "	7 6
D1	5 2 22	...	355 "	6 43
D2	6 3 9	...	473 "	7 30
D3	5 3 0	...	414 "	9 8
D4	6 1 4	...	291 "	6 16

The Trials have gone a long way to demonstrate the point which the Association wish to be borne in mind, viz., that the motor wagon is a practical and commercial success. Goods have been collected from the Liverpool docks, the vehicles carrying them have been subjected to a severe ordeal of hill-climbing, which proved that exceptionally steep gradients have no terrors for them, as well as showing the capability to arrest their progress in the descent. Pursuing the test in another direction they next hauled their loads at a creditable rate of speed distances of thirty or forty miles a day, at the end of which they delivered them at the places to which they were consigned, safe and sound. Their performances have, indeed, astonished many who have hitherto regarded them as the reverse of useful, non-economical, and poor substitutes for horses. The trials cannot fail to have made a deep impression on the owners of the many large industrial undertakings in Lancashire, and the Liverpool Self-Propelled Traffic Association has every reason to be satisfied with the result. To the officials, one and all, great praise is due for the way in which the arrangements have been carried through. We may add that Pratt's motor-spirit was used by the two competing petrol lorries and the cars which followed the Trials. The Judges have awarded a gold medal and diploma of merit to vehicles A1 and A2, Messrs. George F. Milnes and Co., Limited; B1, the Lancashire Steam Motor Company, Leyland; and C1, the Thornycroft Steam Wagon Company, Limited, Basingstoke. The awards in Class D will be delayed for about three weeks.

THE Automobile Street Sweeper Company has been organised at Portland, Me., U.S.A., for the purpose of cleaning streets, etc.

At the last meeting of the Inkberrow Parish Council, Mr. Lowe called attention to the dangerous speed indulged in by drivers of motor-cars, and considered that something should be done to moderate the speed. The clerk was directed to give attention to the matter.

SOME alarm was caused in Cross Cheaping, Coventry, last week, by a motor-car skidding upon the tram line. Swerving on one side, the car knocked down a commercial traveller, Mr. Ernest Troughton, who had his ankle sprained, and was removed to the Coventry and Warwickshire Hospital.

A RUN ACROSS FRANCE ON A RACER.

By A. R. SENNETT.

(Continued from page 246.)

DOGS, no matter what colour, are *bêtes noires* to the racer, and the question is often asked, "What is the best thing to do when one sees that the dog is bent upon either opposing your progress or on measuring his pace with your carriage?" Our reply is, that usually shouting is worse than useless, but that the most efficacious thing is to gesticulate vigorously, as if throwing a missile at the canine competitor. He will then generally deviate to one or the other side of the road, and possibly to reflect that he would quickly have been out of the running as well as out of this world had he essayed to remain in front. Continental cycle tourists, as we can testify from considerable experience, were much inconvenienced from the same cause, and it is found that shouting, and even the business-like whip carried upon the cycle in Austria, were of little effect until the pyrotechnist came to the cyclist's aid with those ingenious little fireworks which made him the terror of the dog instead of the dog the terror of him.

From a high-speed run much might be learned in the domain of zoology. Why, for example, dogs should have a predilection for sleeping in the middle of the road and a tantalisingly sluggish addiction to remove themselves from rapidly approaching sudden death, the ordinary *chauffeur* understands not. Animal idiosyncrasies are clearly displayed to the motorist; the militant audacity of the dog, the painfully nervous tension of the horse, the delicious contempt and imperturbability of the ass, the crass stupidity of the omnipresent fowl or cockerel, who invariably has an appointment to keep on the opposite side of the road at the moment when your car is within five yards of him, with the result that a catherine-wheel of feathers is seen to gyrate over *poulet à l'automobile*. The "stupid" goose, who is not so stupid after all, seeing that he merely stands by the roadside, temporarily converting his curved neck into a straight red-tipped pipe, from which he belches forth hissing defiance as we pass. In this he reads a lesson to the more stupid duck, whose characteristic seems to be her power of waddling clear of danger without hurrying. We remember an old Cornish post-driver offering to present us with a sovereign if he drove over a duck, "For, said he, 'I have driven for thirty years and have not yet succeeded.'" The stupidity of animals, however, is not to be compared with that of many bipeds in charge of quadrupeds. The horse, though such a noble creature, is at the same time a dependent creature: he can be made to do almost anything by sympathetic companionship. Every motor-driver knows that horses seldom misbehave when in company with their four-footed *confères*. For this reason, a gentle word and friendly caress from his master will in ninety-nine cases out of a hundred suffice to dispel from the animal's mind all thought of coming danger. The fact that his master stands by him and speaks to him contents him. But does the master usually treat his horse in this common-sense manner? Not according to our experience! The willing animal is left absolutely unattended and often with his bit removed—a practice which we feel should be made punishable by law—the horseless carriage is heard approaching, his master rushes out of the taproom alongside his horse, to whom he speaks never a word, and clutches violently at the animal's head with an abruptness which would startle any human body, much less a horse. Should the driver be in a cart he usually finds himself with more than half a yard of "slack" in his reins, enabling him the more effectively to "job" his horse's mouth in gathering them up taut—and his horse almost on to his haunches, and, having done this, he finds his hands one on either side of his head and behind his ears, and therefore in the worst possible position to control his horse, who by that time is trying to do the most sensible thing that a horse can do—viz., to turn completely round and run away from the oncoming danger.

Our experience, indeed, is that the annoyances to *chauffeurs* arise more from the ill behaviour of man than of beast. One of the most annoying and indeed most dangerous malpractices of which the waggoner is guilty, and which becomes more pro-

nounced as one gets down towards the somnolent south, is that of sleeping in his wagon behind his slowly plodding teams. If he be going in your direction you are stopped by his ponderous caravansary, and waste much time and lung effort in waking him up. Whereas if he, or rather his team, meet you, you are forced to take up a position on the roadside, and wait the passing of a sleeping mass of negligence drawn by duty-respecting quadrupeds, whose conscientious behaviour should put him to the blush, even though they are unable to rate him in words. Another very dangerous practice on the part of the rural carter is that of rigging up a seat constructed of a couple of poles, and a kind of canvas hammock projecting two or three feet from the side of the cart, and which is not noticeable until one is quite close up to the slowly lumbering conveyance.

For such reasons, amongst others, automobile travelling by night is found to be very enjoyable, and this has been rendered practicable by the recent invention of acetylene gas. In using this, however, the correct design of the projector is a matter of great importance. It is not everything to have a very powerful light, indeed this may be a positive disadvantage. What is wanted is a *phare* constructed upon the *dioptric* principle, and so arranged as to prevent the road being too brilliantly illuminated just in front of the carriage, for the reflected glare from the white road seriously interferes with clear discernment far ahead, namely, at that point where the projector should focus its beams if one is to travel at a good speed.

The automobile of to-day provides an effective means of high speed, common road transport. It is no longer a toy and should no longer be considered as an entity to be utilized as an exhilarating pastime alone. For in addition to this it is ready for efficient service in peace or in war, in pleasurable personal transport, in the despatch of mails, and in the expeditious forwarding of merchandise; nevertheless, the next year or two will, without doubt, bring material developments. Wherein these developments will evince themselves is matter open to discussion. There can be no doubt, however, that where improvement is most necessary is in the tires and in the gearing. Very material improvement has been made in high-speed internal combustion engines, but little that is laudatory is to be chronicled in regard to the *engrenage*. It is certainly disheartening to the builder of high-class motors to feel that not more than fifty or sixty per cent. of the power of his motor ever reaches the road wheels. The system of step by step speeds controlled by the engagement of spur gearing and its release by a formidable clutch is, as a French manufacturer put it, *brusque et brutale*. Obviously what is wanted is a gear that will at all times be in mesh and yet be capable of an indefinite variation in its ratio from zero to the maximum speed of the vehicle.

(To be continued.)

THE Wandsworth Borough Council is making experiments with a view to transforming the dust carts into motor-vehicles.

A MOTOR-LORRY is being experimented with by Messrs. M'Farlane, Lang, and Co., the well-known Scottish biscuit manufacturers, with, we understand, most satisfactory results.

ONE of the first entries for the Strasburg-Colmar-Strasburg race, which is to be run off on Sunday next, under the auspices of the Alsace-Lorraine Automobile Club, was that of a lady—Madame Clemence Hirtzlin, of Strasburg.

MESSRS. MONTAGUE HAUNT AND Co., of 146, Clerkenwell Road, E.C., and Sparkbrook, Birmingham, have sent us a copy of their season's catalogue of motor-cars, cycles, accessories, tools, and electrical fittings. It is an exhaustive and well-illustrated work which should appeal to the motor-car builder. Everything in the way of parts, fittings, or accessories, is quoted in an all but endless list of sizes, with prices graduating to match. Three complete motor-cars of well-known pattern and modest price are also in evidence. Accumulators, batteries, coils, ampèremeters, voltmeters, and electrical sundries appear to be a strong feature. Another point of interest is sets of cells, small but powerful. Repairs and recharging are also quoted for.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

CORRESPONDENCE.

THE 70 H.P. NAPIER CAR IN FRANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR—As there seems to be a great deal of uncertainty as to why I discontinued the Paris-Bordeaux Race soon after Tours, I think it may be interesting to your readers to let them know the reason, and also deal with a few other points which I think are of interest to all English automobilists.

The withdrawal from the race was caused through the clutch wearing to a greater extent than any allowance had been made for, with the result that the lever for pulling same out rested up against a brake lever, and kept the cone from properly engaging, the consequence being that the engine went round, but did not drive the car.

I notice that the makers of the clutch have thought it necessary to write to the papers on the subject. They are quite right in saying that Mr. Napier approves of the clutch, and it is

THE 70 H.P. NAPIER CAR IN ITS GARAGE IN PARIS, WITH MESSRS. EDGE, JARROTT, AND H. DUCROS, JUN.

not only approved, but we have to thank them very much indeed for stepping into the breach at the last moment, as they did, to supply us with a clutch which did its work very excellently in nearly every respect. This trouble that was caused with it will very quickly be remedied and prevented for the future. The main feature of the clutch was successful, but at the same time it was an unfortunate fact that it was the clutch that caused the withdrawal from the race. In no way do I suggest blaming the clutch, as I believe it is one that for these high-powered carriages will have a very successful future.

There seems to be a great deal of misconception, so far as writers in the daily press are concerned, wherein some of them, after dealing with the result of the race, point out that this proves that French automobiles are far ahead of English ones, and that we have a great deal to learn. No doubt there is quite a considerable amount of truth in this so far as racing vehicles are concerned, and it is for this reason that Mr. Napier and I will take racing vehicles to France to compete in the various races. We feel that it is our duty towards our customers to keep ourselves thoroughly informed as to everything that is going on on the Continent, and by actual competition with the very latest products of the French factories get to thoroughly understand our own strength and our own weaknesses, and I am sure on this point every one must agree with me.

Referring to your correspondent's report, I am afraid he has not truly turned to account everything that he saw, as he assumes that because the Napier car weighs 33 cwt. it is necessarily slower than any of the French cars. If he will make it his business to find out the exact weight of Levegh's car and Fournier's car, he will find that the weight carried by each h.p. is possibly even less on the Napier than on the winning car, and if he will them make inquiries in France he will find that on several parts of the road many competitors were timed over one or two kilos. distances, and that wherever this timing was carried out, the Napier car actually did one or two kilos. per hour faster than any car in the race. Mr. Napier's and my tests in France showed us that so far as sheer speed was concerned we seem to be a little bit faster than anything hitherto produced, and I hope at a very early date to very thoroughly demonstrate this publicly. When, however, it came to racing over a long journey, some little points which, unfortunately, time had not allowed us to find out, developed themselves, which caused us delays, three of which are mentioned below.

At Versailles we had to wait some time on the out-word control, being there before our time, and with a wish to prevent the engine getting hotter than necessary I cut out two of the cylinders, but unfortunately had the engine running too slowly, and stopped it. These big engines are of course somewhat difficult to start, and before we had got them started we lost no less than twelve minutes. The reason for this trouble in starting I found, after the stoppage in the race, was an accumulation of dust in my valves. Soon after leaving Chartres some obstacle from the road in travelling fast carried away the belt which drove my pump. This took us eighteen minutes to put right, having to fit a new belt and pump wheel. At Cloyes, again, when waiting at the control, and running the engines slowly, I was unfortunate enough to stop again, and lost eight minutes in starting.

These troubles you will understand were chiefly the result of driving a new car, with which I had had practically no experience, and I may say that Mr. Napier was very much averse to running the car at all, as he did not see how it could possibly do itself justice at such short notice; but personally I felt that there was a great deal of experience to be gained, that I must gain this experience as soon as possible, and that success or failure would be quite understood by any thoughtful person, and that it would be recognised that one could not reasonably expect success over a long journey with an untried vehicle.

The result, however, showed us that a number of little details could be improved, and I hope all of them will be carried out in time for next Saturday's hill climb at Tilburstow Hill, when those interested in watching the struggle Mr. Napier and I are making to produce as successful a racing English car as we have a touring one, to compete with the world, will treat us in exactly the same way as the British public treat the builders of the yacht cup challenger. One must remember that in these vehicles the margin of safety is cut down to an almost vanishing degree for every part. If you will take the history of the French races you will find that in nearly every case, unless every French manufacturer ran a fairly large fleet of vehicles, he would not have much continuity of success with only one in each race. This unfortunately we are unable to do at present, and we have therefore got to do the best we can with one or two in each race.

Yours truly,

S. F. EDGE.

WET AND DRY BATTERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have read with interest the correspondence contained in your issues of the 1st and 8th inst., with regard to wet and dry batteries. We have found with accumulators that certainly at the start there is an inflated amperage, and we have known on many occasions that through the jarring and jaunting of the car the plates have been affected, and the accumulators have given out very quickly. Again, when the accumulators are

being re-charged this operation is often done too quickly, and there is no satisfaction to the driver.

With regard to the Meyra dry cells to which your correspondent C. P. Cobb refers, we have found that on every occasion that we have supplied these they have given entire satisfaction, and we might add that we have sold several thousand sets ourselves. We think he is somewhat wrong with regard to the price, seeing that they are only listed at 15s., and we believe the Meyra Company allow a rebate for old cells of their manufacture, if returned to them in good condition.—Yours faithfully,
B. BRIDGEWATER AND CO.

THE PARIS-BERLIN RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—As I see there are a good many entries for the big international race, Paris-Berlin, it might be, perhaps, interesting to a number of your readers to bring before them a few words of timely warning upon the state of the roads on which the race is to be run, and which route I myself, as a starter in this race, have just gone over in a Durkopp car.

There is no doubt that every driver in an automobile race, and who has been over the route before, will find that he has a great advantage over his opponents who have not taken this precaution. The more so in the case of the Paris-Berlin, as this journey through three countries, with their totally different roads, will require on the part of all drivers the utmost discretion in not over-rating the staying powers of their cars. They should remember the old saying, "Festina lente," however paradoxical this might sound as applied to automobile racing.

Those automobilists who have seen the wonderful *Belles Routes de France* will be bitterly disappointed when they make acquaintance with miles and miles of villainous Belgian *pave*, where, to put it mildly, one is almost shaken off one's seat, and which also means an enormous strain on the springs of one's car.

After passing the Belgian frontier, the road surface is slightly better from Malingen to Aix-la-Chapelle, but any person attempting on this road, with its unexpected zig-zag turnings, any higher speed than 50 kilometres per hour would throw away any chance he may have had of winning the race.

From Aix-la-Chapelle to Hanover the roads, with the exception of the neighbourhood of the Ruhrgebiet, is fairly flat, although, again, almost half of this road is *pave*, but certainly of rather a better class than the Belgian.

There is a kind of track on either side of this *pave* which looks rather tempting to the *chauffeur*, but this nice-looking road is deceptive, and, as often in life, the glittering surface proves otherwise than golden; firstly, as it leaves only a few inches clearance of the wheel track of a racing automobile, it does not recommend itself to high speed; and, secondly, there are little cross channels from time to time (most likely to drain the water off the *pave*) which, although scarcely perceptible in approaching them, are deep enough to almost throw the steering out of one's hands, and deviate the car into the ditch. Therefore, take my advice, choosing out of two evils the lesser: steer straight on the fairly good *pave* in the middle. I have always had to return to this course myself, after having lost much valuable time in attempting to reach higher speeds on the side tracks.

From Hanover to Berlin, which part of the route, by the way, is the least interesting as far as scenery goes, is quite level, and especially on the latter part of this journey. The bugbear of the race will be the tires. Here the famous "Markische" sand, intermixed with sharp flints, will play havoc with pneumatics, and I feel sure that it is an absolute necessity to put on a fresh set of tires at Hanover, as no one can expect that pneumatics that have sustained the severe strain of over 600 miles hard racing will stand the terrors of the sand of the Mark Brandenburg, the famous sandbox of the old Holy Roman Empire.—Yours truly,

ED. E. LEHWESS.

WINDING UP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Work Shirker," I would advise him to communicate with the "Creese" Self Starter Company. I have had some experience with this firm's inventions, and find that it is never necessary to have recourse to the handle for starting my car, a 6 h.p. Daimler.—Yours truly,
SHIFTER.

MR. A. E. J. STEELE writes:—"I note your paragraph *re* A.C.G.B.I. Motor-Cycle Race meeting; you have got the Cup holders mixed up. The *Autocar* Cup holder should be Machin (F. F. Wellington); the *Motor-Car Journal* Cup (five miles) is held by, and in the possession of myself, and I have had no intimation that it will be a handicap, etc. The *Automotor* Cup is held by Buck (Motor Manufacturing Company).

MR. C. JARROTT writes:—"I notice that in a paragraph in your last issue I am stated to be competing in the Paris-Berlin race on a motor-cycle. Apparently some mistake has been made in this respect, as I am not riding a motor-cycle, but am driving one of the new 40 h.p. Panhard cars (Paris-Berlin type). The car is the property of Mr. Harvey du Cros, on whose behalf I am taking it through the race.

PRESS VIEWS ON FRENCH RACES.

RARELY has a race in another country excited so much attention in the English press as did the motor-car contest between Paris and Bordeaux, in which M. Fournier covered the distance of 350 miles in eight hours and forty-four minutes. On the whole, the views of our contemporaries were extremely kind, and although we have noticed an occasional growl, the general tendency of the criticisms on that event has been very fair. Some extracts will be of interest.

"In France," says the *Liverpool Mercury*, "the benevolence of the law and local conditions favour rapid travelling, and automobilists may amuse themselves and others by giving demonstrations of the speed possible of attainment with the new vehicle; but these object lessons are of no profit to residents of the United Kingdom, who are forbidden to run at a faster rate than twelve miles an hour."

The *York Daily Herald* regards the speed as remarkable, and adds that "there was an entire absence of accidents, and the fact that such a race was run in safety ought to reconcile people in this country to a greater rate of speed than that which is at present permitted."

Ireland is evidently prepared to welcome the automobile, for the *Dublin Daily Express* declares that the race "has established the claim of the motor-car to be regarded as the vehicle of the future," and adds, "the question that we have to consider is, What are we doing to help automobilism? The answer is to be found in the state of our country roads, and in the absurd restrictions which are due to the idea of the genus parish councillor that the automobile is an *edition de luxe* of the traction-engine. We ought, at least, to do something practical to encourage automobilism in this country."

Commenting on the race, the *Manchester Guardian* truly remarks, "France has chosen to encourage the new industry of motor-car engineering by allowing self-propelled vehicles to run at high speeds on the public highways, whilst England has discouraged it, at first by subjecting motor-cars to regulations which were framed for the government of traction engines, and even now by limiting the paces of motor-cars to those of a fast-trotting cob. We have succeeded in keeping down the 'motor-car nuisance,' as we are pleased to call it; France has sacrificed something that we cherish, but has gained an undisputed pre-eminence in a craft which bids fair to become one of the most important and profitable branches of mechanical engineering."

"Facts like these," observes the *Globe*, in chronicling the result, "ought to make our local authorities reflect upon the harshness of the regulations affecting speed in this country, by which one of the most promising enterprises of the new century is being stifled."

HERE AND THERE.

TO-DAY (Saturday), the Manchester Automobile Club will hold a run to Nantwich.

ON Saturday, the 22nd inst., the Automobile Club will have a run to Henley, starting at 2.30 p.m.

THERE is some talk of a company being formed to establish a motor-car service between Hill Top and Loscoe, Derbyshire.

WE hear that the Milnes petrol lorry, A1 of the trials last week, is being prepared by the Liverpool Corporation as a high-speed water-van.

WINDSOR Town Council has licensed several motor-cars which are to convey visitors and townspeople to places of interest in the neighbourhood.

MESSRS. LONSDALE, official repairers to De Dion-Bouton, Limited, have removed to new premises, at 41, Waterloo Street, Western Road, Brighton.

THE motor-brougham with a uniformed driver on the box is growing in favour. The Baron and Baroness de Meyer and Monsieur and Madame Von André are amongst the latest who have adopted it.

THE official report for 1900 of the Controller-General of Patents, Designs, and Trade Marks shows a decline in patents relating to cycles, but an increase in the matter of oil engines for use with motor-cars.

THE Empire Roller Bearings Company, Limited, has been registered with a capital of £10,000 to adopt an agreement with the Cooper Steam Digger Company, Limited, and T. Cooper, and to carry on the business of manufacturers of roller and other bearings, etc.

A MOTOR-CAR proceeding down Bishopsgate the other day came into collision with the law, as represented by a police-van. The contact was so violent that the driver of the motor-car was shot out of his vehicle against a lamp-post, and was removed to St. Bartholomew's Hospital.

THE motor-bus which has recently started running in and about Larne is the envy of many a less fortunate Irish district, where railway service is not too convenient. A farmer writing from Crumlin draws attention to the good reception which would certainly greet such a vehicle if run between that place and Lisburn.

MESSRS. BREWER AND SON, Patent Agents, of 33, Chancery Lane, are issuing an index of specifications of patents connected with motor-cars taken out in the United States between the years 1860 and 1900. The work, which is very complete, is published at 7s. 6d., and will be brought up-to-date from time to time. To all interested in patents, as users or as patentees, the list should be of service.

PRIORY MOTOR, LIMITED, has been registered, with a capital of £5,000, to adopt agreements with Arthur Hallett and Co., Limited, with C. L. Loveridge, with the Crawford Gear Company, Limited, and with the Hamilton Motor Patents Syndicate, to carry on the business of engineers, makers and repairers of motors, motor-carriages, cycles, etc. The registered office is at 18, Hertford Street, Coventry.

NOTTINGHAM motorists must look out for squalls. The Workson District Council has been discussing them and their ways, and has estimated the speed at which they negotiate the corners of that town at anything from sixteen to twenty miles an hour. The attention of the police has been called to the matter, and it is hardly likely that the harvest of fines to be reaped from such a source will continue to be ignored.

THE Eagle Engineering and Motor Company, Limited, has been registered, with a capital of £6,000, to adopt an agreement between R. Jackson, of the one part, and J. Kenworthy and J. B. Bindloss, jun. (for the company), of the other part, and to carry on the business of engineers, motor-car and cycle makers. The subscribers are R. Jackson (Mayor's Road, Altrincham),

J. Kenworthy, J. B. Bindloss, J. Brooks, J. W. Hurrell, F. C. Catterall, and J. Rumney.

MESSRS. BAINBRIDGE AND COMPANY, of Newcastle-on-Tyne, are making an experiment in the carrying of the somewhat lighter class of goods in which they deal. They have just imported from Paris an 8 h.p. Panhard motor-car, which they are now using for the purpose of carrying goods ordered by customers to their destination, and if the experiment proves successful they will probably extend the principle to the larger part of their carrying work.

WE understand that the business of the London Motor Company, Ltd., has been taken over by Mr. W. M. Hodges, who will carry it on in future. The premises at Tottenham Street, Tottenham Court Road, W.C., are extensive, and well adapted for garage purposes, and arrangements are being made whereby all classes of repairs to motor-cars can be carried out. Mr. Hodges has had a long connection with the motor-trade, and knows the requirements of motorists thoroughly. We wish him all success in his new venture.

MILLINGTON, EVERITT, AND CO., LIMITED, is the name of a company which has been registered, with a capital of £3,000, to carry on the business of motor-carriage manufacturers, cycle and velocipede builders, etc., and in particular to acquire from F. Millington, of 16, Market Hill, Cambridge, the benefit of certain existing inventions relating to electric motors, starting resistance, and ampère meter, and all patents connected therewith and any improvements thereon. The registered office is at 20, Regent Street, Cambridge.

A FANCY dress carnival, organised by cycling clubs affiliated to the Essex and Middlesex Cycling Union, in aid of the funds of various hospitals, took place last Saturday. This year eighteen clubs and 502 riders took part in the procession, which, after forming in the field adjoining the Eagle Hotel, Snaresbrook, proceeded via High Street, Wanstead, Cambridge Park, Leytonstone, into Woodford Road, again passing the Eagle, Woodford Green, Woodford Wells, and Rangers Road, to Chingford. A notable feature was the motor vehicles which headed the procession. Mr. W. T. Pearce, on a motor-tricycle, was in command, followed by several decorated motor-cars.

A CYCLE and motor race meeting was held on the track at the Glasgow International Exhibition grounds on Wednesday last week, the events including a two-miles motor-bicycle race and a five miles motor-car match between a Darracq and an Argyll car. In the motor bicycle race the result was—1, R. M'Ewan, Ayer (Werner); 2, H. Cantrell, Coventry (Excelsior). Time, 4m. 33s. Only three started, and the other competitor retired early, leaving the race to the placed men. M'Ewan led the whole journey and won by thirty yards, Cantrell giving up in the last lap when he found it impossible to pass his opponent. In the motor-car match, W. M'Lean on a Darracq car beat A. Govan on an Argyll car.

THE other day we had an opportunity of inspecting a new petroleum-spirit motor which has lately been completed by the Eclipse Engineering and Motor Company, of 255, Earlsfield-road, Wandsworth, S.W. The new engine, which is very compact, comprises two water-jacketed cylinders, the jackets and cylinders being cast in a single piece. The cylinders are 3½ in. diameter by 3½ in. stroke, and at a speed of 1800 revolutions per minute the engine will develop 6 h.p. The ordinary practice is departed from in that the inlet valves as well as the exhaust valves are operated mechanically; they are all so disposed as to be readily removed when necessary. Electrical ignition is used to fire the charge, one coil only being employed for the two sparking plugs. A sensitive form of governor is fitted, as also are balanced cranks on the engine shaft. The flywheel is outside the crank chamber, the lower half of the latter being detachable. The engine weighs complete about 1 cwt., and measures about 18 in. by 12 in. by 10½ in. The Eclipse Company are also about to build a new light car to their own designs, which include several new features, to which we hope to refer later on.

CONTINENTAL NOTES.

BY AUTOMAN.

In the Namur-Bastogne-Namur race, 220 miles, held on the 3rd inst., under the auspices of the A.C.B., the results were as follows:—

1st Class: Cars of 6 to 10 h.p., and at least two passengers.—(1) Roland, on an 8 h.p. Gobron-Brillié, in 4 hr. 25 min.; (2) Conrard, on an 8 h.p. Gobron-Brillié, in 4 hr. 45 min.; (3) Dernier, on an 8 h.p. Gobron-Brillié, in 4 hr. 50 min.; (4) Pirmez, on a 6 h.p. Delahaye, in 6 hr. 53 min.

2nd Class: 10 h.p. or over.—(1) Guders, on a 12 h.p. Pipe, in 4 hr. 37 min.; (2) De T'Serclaes, on a 12 h.p. Germain, in 5 hr. 28 min.; (3) Coppée, on a 12 h.p. Germain, in 5 hr. 53 min.

3rd Class.—(1) Hautvast, on a 6 h.p. Vivinus, in 6 hr. 18 min.; (2) Martiny, on a 4½ h.p. Rhenane, in 6 hr. 49 min.; (3) De Smedt, on a 4½ h.p. De Dion, in 7 hr. 2 min.; (4) Francotte, on a 5 h.p. Duryea, in 7 hr. 44 min.; (5) Joostens, on a 5 h.p. Peugeot, in 7 hr. 54 min.

THE A.C.F. at its last meeting had to deal with several complaints in connection with the Paris-Bordeaux race. In the first place a complaint was lodged against Fournier for refusing to obey the orders of the Control on leaving Chataudun. Fournier was fined 20 francs. The next complaint was against a certain M. Varlet, who although not entered for the race, placed a large number ten on his car and got controlled at various towns along the road. M. Varlet apologised for his conduct to the Club. Several complaints were made with reference to the exhaust outlets of various cars, which were placed in such a position as to make it almost impossible for another car to pass them on account of the direction in which the dust was driven. It was decided that in future an examination of the exhaust box of every car should be made, and that no car with this defect should be allowed to compete.

In Austria there is to be accomplished an adaptation of the petrol automotor to railway service, which is at once of a novel and interesting description. The Minister of Railways has ordered from the firm of Bierenz and Co. a third-class railway carriage to carry thirty-two passengers, and furnished with a four-cylinder Daimler petrol motor of 30 h.p. This car is intended to be used on short branch lines where there is not much traffic. It is to attain a speed of twenty-five miles per hour, and to carry petrol enough for ten hours' running.

THE following is the official classification of the Paris-Bordeaux race issued by the A.C.F.:—

No.		h.p.	Average speed, miles per hour.
1.	Fournier ...	28 Mors ...	52.9
2.	M. Farman ...	28 P. and L. ...	49.0
3.	Voigt ...	28 P. and L. ...	45.1
4.	Pinson ...	28 P. and L. ...	42.1
5.	Hachette ...	20 P. and L. ...	41.5
6.	H. Farman ...	28 P. and L. ...	39.4
7.	Hourgières ...	28 Mors ...	37.9
8.	Girardot ...	28 P. and L. ...	36.9
9.	P. de Crawhez ...	28 P. and L. ...	36.5
10.	Lefebvre ...	30 Bolide ...	27.9

THE Paris-Berlin race is attracting the interest of the motor world to an unexpected degree. There are already 154 entries in the racing section, and the list is open until the 26th inst., the eve of the race, on payment of a double entrance fee. There are 59 entries for the tourist section. The special train which was to be organised by the A.C.F. has been abandoned, as there was not a sufficient number of applicants for places. It will, however, be possible for enthusiastic sportsmen to witness the arrival of the cars in all the three laps by taking the 9.25 p.m. train from Paris to Aix-la-Chapelle on June 26th, the 9.54 p.m. train from Aix to Hanover on the 27th, and the twenty-six minutes past

midnight train from Hanover to Berlin on the morning of the 29th. Amongst the prizes offered to the victors will be one from the Emperor of Germany, one from the King of Belgium, one from the President of the French Republic, and one from the Prince of Oldenbourg. The Continental Caoutchouc and Gutta Percha Company is also offering a number of prizes in each section.

THE following history of the first steam tricycle, taken from the account of the lecture given by M. Léon Serpollet in Brussels last month, is so amusing that I feel sure it will interest the readers of the *Journal*, and especially those who have seen and appreciated, as I have, the latest Serpollet steam-car, which passes milestone after milestone at the rate of fifty per hour. The motor of the tricycle had one cylinder and a boiler like a coke stove, with a chimney out of which steam and sometimes thick smoke escaped. M. Serpollet applied for a licence to drive it, and started off to pass his examination as a *chauffeur*. The road was rough and badly paved with uneven sets, and the tricycle bumped and bounded along until it suddenly came to a dead stop—a breakdown. The cause was not difficult to locate; the bumping had loosened the fire bars

THE ORIGINAL SERPOLLET STEAM CAR.

which one by one had dropped out, carrying the fire with them, and leaving the road behind strewn with the smouldering remains. Nothing daunted, M. Serpollet picked up the bars, fixed them in again, relit the fire with the aid of a neighbouring coal merchant, and set off again, arriving only an hour behind time. He got his permit, and I think he deserved it.

A STEAM motor-'bus will shortly be run between Larne and Garrontower, Ireland.

AN Irish contemporary suggests that a service of motor-cars between Rathdrum, Glendalough, and Poulaphouca should pay splendidly during the summer months.

It is stated that M. Fournier, the winner of the Paris Bordeaux race, will probably go to America to compete in the Buffalo to Erie race, which is to be run off in September.

WE regret that, owing to a printer's error, the wrong block was inserted in the Daimler Motor Company's advertisement in our last issue, the illustration given being that of the Daimler 6 h.p. *tonneau*—not the King's Car.

MR. D. H. MORGAN, 22, Clarence Street, Cheltenham, has taken over the business of Messrs. Clark and Morgan, of Gloucester and Cheltenham. His only address is now Clarence Street, Cheltenham, the premises at Gloucester having been closed. Mr. Morgan employs a staff of experienced mechanics, and is competent to undertake any repairs to motor-cars. He also stocks petrol, and all accessories.

THE TILBURSTOW HILL-CLIMBING COMPETITION.

BELOW we publish the complete handicap for the English Motor Clubs' Hill Climbing Contest at Tilburstow Godstone, to-day (Saturday), at four o'clock sharp.

In the first column there are the starts according to the respective classes which are specified. In the second column there is the start of the general handicap for all the entries. Altogether there are forty-six entries, so that, given fine weather, the meet should be a great success.

CLASS 1.—BICYCLES.

No.	Name.	Machine.	H.P.	No. of persons carried.	Handic'p for class.*	Handic'p for total entries.*
1.	Tessier, T. H.	Werner	1½	1	scratch	0 42
2.	Leonard, J.	Do.	1½	1	do.	0 42
3.	Fellows, J. H.	Do.	1½	1	do.	0 42
4.	Bluhm, A.	Bluhm	1	1	0 20	1 20
5.	Lamb, H. J.	Werner	1½	1	0 20	1 2
6.	Westlake, A. T.	Bluhm	1	1	0 20	1 2

CLASS 2.—TRICYCLES UP TO 3 H.P.

7.	Dennis, R.	Speed King	2½	1	0 15	0 35
8.	Parrish, T.	De Dion	2½	1	0 15	0 35
9.	Spencer, T. L.	Motor Manf. Co.	2½	1	0 15	0 35
10.	Attlee, Dr. J.	De Dion	2½	1	0 25	0 45

Competitors pedalling after passing the starting point may render themselves liable to 'cyclists' Union rules.

* The times given are the starts allowed to these vehicles.

A SERIES of manoeuvres with motor-cars is about to be carried out at Chaumont, France, with the object of testing the possibility of this form of locomotion in time of war. The experiments will be conducted in the presence of several generals and military attaches, attended by their respective staffs.

FURIOUS DRIVING CASES.

At Weobley, William Marriott, of St. Owen Street, Hereford, cycle maker, was charged with refusing to stop his motor-car when signalled to by Mr. F. T. Edwards, of Byford, and also by Mr. Francis Evans, of Bredwardine, both in the parish of Bishopstone, on May 15th. He was also charged with travelling at a greater speed than allowed by the regulations. Defendant pleaded not guilty to all the charges, and read a long statement to the Bench. A fine of £2 10s. was imposed in each case of not stopping, and the other charge was dismissed.

At the Knaresborough Petty Sessions William Stone, engineer, of Doncaster, was summoned for furiously driving a motor-car on the York and Harrogate Road, near Knaresborough, on June 2nd. The police alleged that the defendant's car was going at the rate of eighteen or twenty miles an hour. The defendant was fined £5 and costs.

At Nottingham, Henry Belcher, of Beeston, and general manager for Humber's, Limited, was summoned on three charges respecting the furious driving of a motor-car in Beeston on May 16th. He was summoned, in the first place, for being the owner of the car; secondly, for being the driver of the carriage; and for driving a light locomotive along the highway at a greater speed than twelve miles an hour. Defendant pleaded not guilty. Evidence regarding the speed at which the defendant was travelling through the Beeston High Street was given by several tradesmen, and no witness estimated it at less than twenty-five miles an hour. Police-constable Tootle, however, thought that it was not less than sixteen miles per hour. The defendant, after being sworn, stated that he was travelling between eight and ten miles an hour; he could pretty well tell the speed through the position of the levers. The Magistrates retired to consider their verdict, and on their return Mr. Starkey said that they had carefully considered the case, and allowing for the discrepancies of witnesses with regard to speed, the defendant would be fined £5, including costs.

At King's Heath, J. W. Stocks, of Moseley, was summoned for driving a motor-car at an excessive speed on the 16th ult., on the Alcester Road, Moseley. Constable Stanway, on the afternoon of that day, saw the defendant, who is a well-known motorist, in charge of a motor-car, which was travelling at the rate of sixteen or eighteen miles an hour. Other witnesses having deposed to excessive speed, defendant denied that he was driving faster than usual, and said the witnesses had judged the speed of the motor by the noise it was making.

At Lambeth, Harry Tate, of Burton Road, Brixton, was summoned for driving a motor-bicycle to the common danger. P.C. Wood, 626 W, stated that at midday on the 23rd ult. he was in the Brixton Road when he saw the defendant riding a motor-bicycle in the direction of Brixton Hill at the rate of ten miles an hour. A young lady who was crossing the road at the time was knocked down, but was not hurt. Witness asked the defendant why he had not given some warning of his approach. He replied, "If you were to take the wool out of your ears you would have heard it." The defendant said it was really the girl's own fault. He blew his horn three times. Miss Davis, the young lady who was knocked down, said she did not hear the warning. There was always a noise under the railway arch. Defendant; I am very sorry. I am glad she is not hurt. Mr. Hopkins: That is a sufficient apology to her, but not to the public. You must pay a penalty of 40s. and costs.

At Coventry, Mr. Thomas Bolton, of Lightoaks, Oakamoor, Staffordshire, a Justice of the Peace, was fined 10s. and costs for driving a motor-car at an excessive speed. The constable timed the defendant as travelling twenty-six miles an hour. He immediately stopped on the constable holding up his hand. Lord Craven said he wondered the defendant stopped at all, as the constable was in plain clothes. Defendant said no one was in sight and the car under perfect control.

At Epping, Nicholas Darmoris, of Herne Hill, was fined £2 and a guinea costs for furiously driving a motor-car at Gregory's Hill, Epping. The police expressed their determination to stop all furious driving in the district.

At Guildford Petty Sessions, on Saturday last, Mr. Bramson, of Dulwich, was summoned for driving at a speed exceeding 12 miles an hour along the London road, near Ripley. A police sergeant gave evidence, and stated that he timed the defendant for half a mile, which distance was covered in one minute, making thirty miles an hour. His evidence was supported by two officers in plain clothes, the three of whom were very much disconcerted by a searching cross-examination. When the second officer had given his evidence and stated that he was with the sergeant, Mr. Staplee Firth, who defended, immediately asked him why it was that he happened to be with the sergeant at the time. This question was not answered satisfactorily. It was immediately followed up by another one asking him if he was in uniform or plain clothes, whereupon he stated he was in plain clothes. The question was then put why he was with the sergeant and why he was in plain clothes. He refused to answer, and sought the protection of the Bench, whereupon the magistrates stated that they did not think the question ought to be asked. This raised a protest by Mr. Firth, who stated that if the law was to be administered in this un-English manner and the police were to be assisted by the magistrates in carrying out such disreputable means, it amounted to a grave scandal in the administration of justice. He followed this up by asking the magistrates why they considered it part of their duty to surround the police officers with a halo of perfection as against gentlemen who happened to prefer the use of motor-vehicles, and strongly protested against the Bench encouraging the police to carry out their duties

by dissimulation and trickery. Mr. Firth then stated that he should insist upon the matter being cleared up in a straightforward way, and subsequently he succeeded in eliciting from the policemen that they had been specially ordered to look out for motor-cars. A third policeman refused to state why he was in plain clothes, what his orders were, and why he was on a bicycle, but ultimately he had to admit that he was under special orders. The Bench stated they did not consider Mr. Firth had any right to interfere with the private orders to a policeman, but it was pointed out that when orders were given from those in immediate command of the police to effect a certain object, it was perfectly obvious that the temptation to distinguish themselves would lead these men into an excess of zeal and they would take good care not to come home empty-handed. The three policemen were so intent upon their prey that they all swore that Mr. Bramson admitted that he was going considerably over the regulation pace. This statement was denied by Mr. Bramson and Mrs. Bramson, who was with him in the car. The tactics of the policemen were very strongly criticised by Mr. Firth on behalf of Mr. Bramson, and the magistrates ultimately in effect found that the police had given false evidence and the charge was dismissed. One very interesting piece of evidence was elicited during the course of the hearing, as it appeared that Mr. Bramson had been stopped the same day, near Esher, by a constable in uniform and one in plain clothes. Several civilians were about, and they stopped to hear what was going on, and when they heard the policeman accuse Mr. Bramson of going over twelve miles an hour and demand his name and address all the civilians protested and stated the charge was untrue and unfounded, and they offered Mr. Bramson their cards and stated that they would come and give evidence to prove that what the police stated was untrue, upon which the officers instantly withdrew from the combat and stated that they would not take any steps in the matter.

At the Arundel Petty Sessions summonses were heard against Mr. Douglas Whitehead, son of the manager of the Beach Hotel, Littlehampton. The first summons was for driving a motor-car in Terminus Road, on May 24th, while the fittings of the car were in such a condition as to cause danger to persons on the highway. Defendant pleaded not guilty, and was defended by Mr. Staplee Firth. The first witness, William Hewitt, stated that at 4.15 on May 24th he was driving a horse and trap in Terminus Road, when he met a motor-car being driven by defendant, and, had it not been for a constable and another man, there would have been a bad accident. Defendant stopped the car in the middle of the road, but the machinery kept running, and made as much noise as a machine gun. By the Bench: There was another horse standing near at the time, but that did not mind the noise. Mr. Firth: Why don't you train your horse to these new vehicles? Do you know they have as much right on the road as you?—Yes. Other witnesses having been called, P.C. Carpenters said that, seeing the motor-car "do a jump" and stop, and that Mr. Richardson's horse was very restive, he thought it was a very dangerous position. He put up his hand and called to defendant to shut off the engine, which was making considerable noise, but he took no notice, and went down High Street. Mr. Firth: If Mr. Burchell (a previous witness) says in that box—and the groom also—that Mr. Whitehead pulled up when he saw the horse was frightened, and that he did not proceed on his journey until after the horse was under proper control, are they giving a fair version of what happened or not?—They might be in saying that. Then why do you go and tell their worships something to try and create prejudice against this gentleman? After further argument, Mr. Firth contended that they had no evidence about the fittings of the motor-car, and he further submitted that no one could complain of the engine running if the motor was stopped when required. Finally the summons was dismissed.—A second case against defendant was withdrawn.—A third summons against the defendant was then proceeded with, which charged him with failing to stop a motor-car in Surrey Street, Littlehampton, on May 24th, upon the request of Robert Browning, who was in charge of a restive horse. Defendant again entered a plea of not guilty. Browning said at 4.20 p.m. on May 24th he was coming from Pier Road into Surrey Street with a load of timber on a carriage drawn by one horse. Defendant was coming in the opposite direction with a motor-car, and, as the horse became frightened, he held up his hand for defendant to stop. Defendant took no notice, but shot by him at full speed, at a rate of about fourteen or fifteen miles an hour, and he did not seem to care whether he (Browning) was killed or not. Cross-examined: He was leading the horse at the time. He did not think defendant saw him "salute"—if he did he would have stopped. Mr. Firth having submitted that the case had not been made out, the Bench decided to convict, and imposed a fine of 20s. and £1 1s. 6d. costs. Mr. Firth asked the Bench to allow the costs on the other two summonses. He had a precedent for it in a case in which the Bench awarded £5 costs, where the police did not succeed. His client had succeeded in the other two cases, and in common justice was entitled to costs. The Bench, however, declined to allow the costs, but agreed to stay execution to allow Mr. Firth to consult his client as to whether he would carry the case to the High Court.

At Bow Street, Abraham Carlish was charged with driving a motor-car to the common danger. Defendant declared that he was not going more than eight miles an hour, and added: "If your worship will not believe me I will take you out for a ride." Mr. Marsham declined with thanks, and defendant continued: "You will be perfectly safe, I assure you. On the very day I was served with this summons I drove three members of the County Council to an automobile demonstration, and we

had a fine lunch. They will testify to my capabilities." Mr. Marsham consented to an adjournment, but a few minutes later was asked to settle the case at once, and a fine of 20s. was imposed.

At Tadcaster, James Haxton, a motor-car driver, of Knaresborough, was charged with driving a motor-car at a greater speed than twelve miles an hour down hill at Tadcaster, on May 12th last. The statement of Superintendent Knight and the evidence of constables showed that the defendant was the driver of a car which plied for the public, and on the day in question was returning from York with a load of eleven passengers. Through Tadcaster he went at a rate of twenty-four to twenty-six miles an hour, despite the warnings of the police. Haxton was fined £5 and costs.

AN OBSTRUCTION CASE.

At Marlborough Street Police Court on Tuesday, the 4th inst., Mr. Moffat Ford, the Managing Director of the Motor-Car Company, Limited, was summoned for wilfully causing an obstruction in Shaftesbury Avenue, W.C. The police-constable on duty in Shaftesbury Avenue at 11.25 on the morning of Saturday, May 18th, deposed that he saw a motor-car standing outside the premises of the Motor-Car Company, No. 168, and drew defendant's attention to this fact, and requested him to take the car inside. Defendant then said, "I am not particularly anxious to take it inside," and then went away. Witness stopped in view of the car for forty minutes, and then went to the defendant; he told him that he would be held responsible for the occurrence, took his name and issued a summons. Mr. Moffat Ford in his defence asked the constable what he was doing during the forty minutes. The constable stated that he kept in view of the car and nobody could have taken the

car away and brought it back again without him seeing it. Mr. Moffat Ford then addressed the magistrate, directing his attention to the Local Government Board Regulations made in connection with the Locomotives on Highways Act, 1896, in which it was ordered that a motor-car must not be left standing in such a position as to cause any unnecessary obstruction in the roadway. The learned Magistrate (Mr. Denman): "Yes, but that does not give you permission to cause even necessary obstruction for an indefinite time. Defendant then pointed out that Shaftesbury Avenue opposite the Motor-Car Company's depot was 36 ft. wide, and that this width was sufficient to permit of free circulation of six streams of traffic. Mr. Denman: Then what I want to know is why you monopolise a sixth of it. The public have a right to the use of the whole of the roadway, and you, as a member of the public, have as much right as anybody else to its use. By the Local Government Board Regulations, a motor-car may certainly be left unattended under proper conditions, and if you were only making a call of a few minutes and then came out and drove the car off again I could understand it. Mr. Moffat Ford: Well, then, your Worship, it seems to me a question of time limit, and I should be very glad if you would kindly give me some idea of what you consider a reasonable time. Mr. Denman: That, in every case, must be left to the discretion of the magistrate. In this case you were not making a call, but the car was left in the roadway, when you might just as well have taken it inside, and I do not consider that forty minutes is a reasonable time for the car to be left standing. I shall therefore fine you 20s. and the cost of the summons. Mr. Ford thanked his Worship for his explanation of the law and then withdrew. We reproduce herewith a photograph of the car taken immediately after the incident on May 18th, showing the obstruction complained of.

AN EXPENSIVE MOTOR-CAR.

At the Southwark County Court, on Tuesday, before his Honour Judge Addison, K.C., Arthur Everson, described as a practical plumber, of Stevens Street, Bermondsey, sued Thomas Thompson Hirst, a publican, of Trinity Street, Borough, to recover £8 17s. for plumbing work done. The defendant counter-claimed for £8 5s., the price of an experimental motor-car and an electric battery and coil. Mr. Philcox, solicitor, appeared for the defendant, and stated that his client admitted the claim. The work was done at the Pagoda public-house, Bermondsey New Road, of which he was then proprietor. Whilst it was being carried out there was some conversation about a motor-car which the defendant had experimented with, and the plaintiff agreed to buy it for £7 10s. He had also an electric battery and coil, for which he agreed to accept 15s. His Honour: A very cheap motor-car. How much did it cost you? The defendant: About £280! The defendant went on to explain that he and two engineers of Rotherhithe built the car as an experiment, but it turned out a failure, in that it cost too much to run. The idea was to work the motor by gas generated by the car as it travelled. The gas was generated all right and the motor was made to work, but the cost as compared with other motive power was too great to make the machine a success. His Honour: A curious experiment for a publican. A man needs to know a very great deal to improve even a little on gas engines, but when it comes to motor-cars—well—I don't think you were a very wise man.—The defendant: It was an oil motor at first with one cylinder and we put two cylinders into it. The plaintiff said the motor was a helpless mass of iron, and for a long time was stored in the defendant's beer cellar. Then it was taken on to a lead roof, where it remained for a time, exposed to wind and weather. Eventually the defendant, finding it in the way, asked witness to take it away, clean it up, and try to sell it. He took it away and partly cleaned it. When he tried to sell it and showed it to engineers they simply laughed at him. It was in a terrible state; there was no driving gear, and, in fact, he found it useless to spend any more time upon it. As to buying it, he had never thought of such a thing. Electricity, oil, gas, and everything else had been tried in it, but it had proved a failure. An engineer named Crier said the machine was in pieces and the man was not yet born who could put it together; it was partly composed of gas piping. A son of this witness declared that the machine had no more resemblance to a motor-car than a donkey had to a racehorse. The Plaintiff: The defendant said he would see about the driving gear, and when that was fixed many cycle people would jump at the car. His Honour: And did they jump? The Plaintiff: I never showed it after I had been laughed at. His Honour remarked that it wanted a very smart man to successfully experiment with motor-cars, and gave judgment for the plaintiff on the claim and counter-claim, with costs.

CHARGES OF OBSTRUCTION.

At Bow Street, Walter Bersey, of the Automobile Manufacturing Company, Long Acre, W.C., appeared to a summons charging him with wilfully causing an obstruction.—Evidence was given to show that a motor-car was left outside the defendant's premises for thirty-five minutes, causing considerable obstruction to the traffic.—Mr. Staplee Firth, for the defence, said the police seemed to have got hold of the notion that because the motor was a new thing they must "go" for it. The defendant had some business to transact, and left his motor-car while he did it, in much the same way as a gentleman might leave his carriage outside a shop or club.—Mr. De Rutzen said it was wrong to suppose that there was any kind of feeling on the part of the police against motor-cars. In the present instance there had been an obstruction, and the defendant must pay a fine of 5s. and 2s. costs.—Notice of appeal was given.

A BIG LIQUID FUEL BURNER.

On Monday afternoon we journeyed down to the works of the Clarkson and Capel Steam Car Syndicate, Limited, at Deverell Street, S.E., to witness a demonstration of what is described as the largest liquid fuel burner so far made. The burner, which is on the Clarkson system, has been designed for raising steam in a water-tube boiler of 200 h.p., for one of the fire-floats on the River Thames, in substitution for coal firing at present used. The Fire Brigade have, for more than a year, had in regular commission a land engine heated by liquid fuel on the Clarkson system, and the results have proved so satisfactory that the Chief Officer is able to report the engine capable of exerting her full power 2½ minutes after the call, a result never accomplished by coal firing. This 200 h.p. burner is very much larger than is necessary for a land engine, and has been specially designed to keep burning at a small flame continuously day and night, just keeping a little steam in the boiler, and ready at any instant to give out its full power in order that the vessel may be ready to be propelled at full speed under its own steam immediately the officers are on board. The steaming power of the boiler is greater and more uniform than is the case with coal firing, and the life of the boiler is much prolonged from the same cause. The oil supply is contained in two long rectangular tanks of about 400 gallons

capacity, which are placed on each side of the engine-room, and the oil is pumped into a copper reservoir to a pressure of forty lbs. per square inch against a cushion of air, gauges being provided to indicate both the pressure and the quantity of oil contained within the reservoir. The quantity of oil pumped into the reservoir is automatically adjusted in accordance with the rate of consumption, and, therefore, once the burner is ignited it will go on working as long as any oil remains in the tank, at any rate of consumption, either high, low, or medium flame, and without any adjustments of the oil pump. The burner is capable, at its maximum power, of producing considerably over 100,000 British thermal units per minute.

One of the special features of the Clarkson system of oil burning is that the burner may be turned down, burning perfectly at a very low flame, consuming but a very small fraction of the maximum supply. This is particularly advantageous when a sudden demand for steam is likely to be made. The burner is ignited in the first instance by compressed gas, which is burned in a series of jets around the vaporiser, the gas cylinders being fitted with gauges and reducing valves to maintain a proper working pressure. We have only to add that the demonstration was very successful.

THE BIG EVENT OF 1901.

As already announced, official trials of motor-vehicles will be held in connection with the Glasgow Exhibition from Monday, September 2nd, to Friday, September 6th, next. The trials will consist of a daily run of 90 to 110 miles and will also include some hill-climbing tests. The entrance fee is to be £20 if paid before twelve o'clock noon to-day the 15th inst. An additional sum has to be paid in respect of vehicles entered after this date. In making the entry no description of the vehicle need be forwarded. When the final regulations are published full particulars of the vehicle must be supplied, but the entries may be withdrawn and the entry fee reclaimed, if the official regulations are not approved by the owners of the cars. Entry fees should be forwarded to the Secretary, Automobile Club, 4, Whitehall Court, London, S.W.

At the time of writing the following vehicles have been definitely entered for the trials which promise to be of a very important character:—

- 4 vehicles by the Motor Manufacturing Company, Ltd.
- 2 " by Messrs. G. F. Milnes and Co.
- 2 " by the New Orleans Motor Company.
- 3 " by the Roadway Autocar Company.
- 3 " by the Wolseley Tool and Motor-Car Company.
- 3 " by the Daimler Motor Company.
- 2 " by the Star Motor Company.
- 1 vehicle by the Motor Power Company, Ltd.
- 1 " by the Clarkson and Capel Steam Car Syndicate.
- 1 " by Messrs. Wilson and Filcher.
- 1 " by Messrs. Parr and Co., Ltd.
- 1 " by the Hozier Engineering Company, Ltd.
- 1 " by De Dion-Bouton, Ltd.
- 1 " by the Century Motor Company.
- 1 " by the Motor-Car Company.

The following have notified their intention of entering vehicles:—

- 1 vehicle by Messrs. Panhard and Levassor.
- 2 vehicles by the Lanchester Engine Company, Ltd.
- 3 vehicles by the Locomobile Company of America.
- 1 set of tires by the Dunlop Tyre Company.

The Austrian Daimler Motor Company has lately supplied a 10 h.p. motor-van to the Vienna Crystal Ice Company. The van will carry three tons.

In a case at Leeds, in which one policeman said the motorist was going at twelve miles an hour, and another that it was at least fourteen, the machine was a motor-cycle which was out of order, and the rider declared it could not possibly go more than nine or ten miles an hour. This was held to be excessive, and, of course, the police evidence was sufficient to ensure a fine.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, JUNE 22, 1901.

[No. 120.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

UPON the occasion of the meeting at Leicester of the Incorporated Association of Municipal and County Engineers on the 29th inst., the Club have arranged for motor-cars to attend for the purpose of conveying members of the association round the neighbourhood of Leicester on that day, it being deemed a favourable opportunity of giving the Engineers and Surveyors of County Councils a practical insight into automobile control. As already announced, the occasion will be made a Club tour, starting from the Club premises on the 28th inst., at 12.30 p.m. It is hoped that all members of the Automobile Club who own motor-vehicles will make a point of driving or sending them to Leicester on the occasion of the conference. In its demonstration to Chief Constables and to County Councillors, the A.C.G.B.I. has done much good work, and now that another opportunity is offered of demonstrating the capabilities of the motor-car we trust that the members will support the occasion as far as possible.

The Lincolnshire Automobile Club.

ON Wednesday, the 12th inst., the Lincolnshire Automobile Club visited the Dukeries. Led by the Mayor (Mr. C. W. Pennell, the chairman of the Club), the party started from Lincoln, and proceeded via Tuxford to Edwinstowe, being there met by other members. Luncheon was partaken of at the Forest House, and then, escorted by Mr. Naish, the proprietor, who expressed himself delighted with the ride he had on Mr. Pennell's car, the party was taken round the Dukeries, special permission having been obtained with respect to the Clumber estate. Tea was enjoyed at the Normanton Inn. Led by the Mayor once more the Club proceeded to Markham Moor by way of the Duke's Drive, and on to Lincoln, the ride home being most enjoyable. In addition to the Mayor and Mrs. Pennell, on their De Dion voiturette, the party included, among others, Mr. W. B. Jevons (vice-president) and Mrs. Jevons, on an M.M.C. quad; Mr. P. Wright and Mr. T. Tindall, De Dion tricycles; and Mr. Wilkinson (secretary), on a Progress tricycle.

The Kentish Motor-Car Service.

ALTHOUGH one of the first two steam motor-cars despatched to Tunbridge Wells met with a slight mishap at Bromley, which caused some delay, its fellow more than fulfilled the expectations of the crowd of enthusiastic townsfolk who greeted its arrival, and the wreath with which it was decorated was well earned. Up hill and on the level the vehicle—a Bayley steam wagon—maintained a fairly uniform pace on the journey, running in at the finish up Dry Hill with a regular spurt. Subsequently it paraded the town, negotiating Mount Ephraim and the many ups and downs of various parts in a most creditable manner. At a dinner given to celebrate the happy event some interesting particulars as to the future of

the service leaked out. Among others, that the proposed rate of transport taken all round works out at about half that of the railway. It is not proposed to start the regular night service till the Company is fully equipped with eleven powerful cars.

A Run on a Locomobile.

ON Saturday last we had a pleasant experience in the way of a run on a Locomobile, a vehicle of this type, kindly provided by the Locomobile Company, conveying us to Godstone, for the English Motor Club's hill-climbing competition. The car was one of the very latest type and comprised several important improvements, notably a feed water heater, and means by which the driver can, from his seat, regulate the burner. After seeing that the water and petrol tanks were filled we set out on our twenty miles journey, which was accomplished without incident of any kind. No stop was made en route, and the quiet and easy running of the vehicle up hill and down dale—we travelled via Mitcham, Beddington, and Purley—was a pleasant surprise. In the evening Mr. Letts drove us home in a similar car and over the same route. The run was so free of incident that there is absolutely nothing to write about it. Not once did we tarry on the return trip, and although we did not appear to be travelling fast, the time occupied was well up to the legal limit, and we were home fully two hours before we should have been had we been compelled to return by train instead of by automobile.

Municipal Motor-Vans.

WESTMINSTER'S City Councillors are considering the further extension of the system of motor-vans for municipal purposes, a marked success having attended road-watering and refuse-collecting undertaken by experimental vehicles. One of the chief points which is engaging the attention of the Committee appointed to report on the matter is the adoption of a vehicle which will also be available for the removal of snow, last winter's experience having demonstrated that motor-vans cleared the streets in a sixth of the time and at less than half the cost of horse-drawn vehicles.

Automobile Tours.

WE hear that an enterprising tourist agency is pressing the automobile into its service, and is projecting a motor-car tour in Normandy and Brittany. The vehicle to be employed will seat from eight to ten persons, and the first tour will be in charge of Mr. Harold Dawson, of Bradford, who is familiar with most of the Continental highways. The tours will commence at Havre, on Saturday, August 3rd, and each succeeding Saturday during August, and the route will be *via* Honfleur and Trouville to Caen, where the Sunday will be spent. On Monday the route will be continued *via* Bayeux, Coutances, Granville, Avranches, and Pontorson to St. Michael. St. Malo, Rennes, Mayenne,

Alençon, Evreux, and Rouen will then lead the way to Havre, whence English tourists will be able to return home. It is calculated that the cost of the whole journey in Normandy and Brittany will be ten guineas, including travelling and hotel expenses. The progress of the initial trip will be keenly watched by the trade, both in England and France.

Pending Litigation.

PROBABLY no industry has ever been hampered as is the infancy of the motor-car. As well as three cases of infringed patents disposed of last week, and referred to elsewhere, several others are pending. In the Chancery Division, Mr. Justice Joyce is to try an action between the British Motor Company, Limited, *v.* Ford. The latter, by special arrangement, will not be heard before July 16th, while the action of the Motor-Carriage Supply Company, Limited, *v.* British and Colonial Motor-Car Company, Limited, appears in the same judge's list. In the King's Bench Division there is the Dunlop Pneumatic Tire Company, Limited, *v.* Toon and Son; and Bayleys, Limited, *v.* Motor-Car Company, Limited.

The Automobile Club of New England.

THE Automobile Club of New England has recently established its headquarters in a handsome building in the suburbs of Brookline, Mass., in the centre of a pleasant district, with good roads extending in all directions. Also connected with the club house is an estate which had already been adapted

to the needs of a driving club. The New England Club is planning to make its new house the centre for a number of long and short distance tours and competitive runs this summer. Incidentally it makes a pleasing and handy starting place, for both house and garage are provided with a telephone, and at the latter members are provided with all requirements, repair implements, lubricating oils, and expert attendants.

An Excellent Example.

THE Highways Committee of the Essex County Council are setting an example which we trust will be followed by similar bodies all over the country. At their last meeting the Committee decided to recommend the purchase of a motor-car for the chief surveyor of Essex main roads (Mr. P. J. Sheldon). There were two arguments in favour of this course, which led to the adoption of the resolution. One was that Mr. Sheldon would be enabled to travel over about twice as many miles of road as under the present system; the other that he would be

able to thoroughly appreciate any unevenness or other defects in the roads.

Another Trans-American Failure.

ONCE again the attempt to make an automobile trip across the United States has ended in failure. Though no one may question the amount of grit possessed by Mr. Alexander Winton, yet too much grit and too much sand when they comprise all there is of an alleged American road are too much even for Mr. Winton and Mr. C. B. Shanks, hence their abandonment near Winnemucca, Nevada, of the attempt to make a Pacific to Atlantic record for the Winton car. The machine stalled in a sand hillock near that place, and could not proceed. The two automobilists took the train for Cleveland, and the machine was despatched by goods train as soon as it could be dug out. At Emigrant Gap, Cal., an axle was broken, causing a delay of several days while the damage was being repaired. The roads over the mountains were very rough, and the desert beyond impassable on account of the deep sand. Mr. Winton is said to be in no wise convinced that he cannot make the trip as planned, and will attempt it again with a vehicle specially built to combat the peculiar conditions which confront a motor-carriage in a trans-American trip.

Electric Fire-Engines in Paris.

THE automobile is meeting with increasing employment in public services. During the past two years the Paris fire brigade have been using an electric service wagon, constructed by Bouquet, Garcin and Schivre to the designs of Captain Cordier, and the van has done such excellent work that the automobile equipment of the fire brigade has now been extended by the addition of two more vehicles upon the same system, one for the engine and the other for the ladder. Of course the advantage which has induced the authorities to adopt electric vehicles is the saving of time. The vehicles are always ready to start at a moment's notice. A few seconds after the men are rung up the engine leaves the shed, followed by the reel and the ladder, and not only is time gained at the start, but the vehicles travel much more quickly than when drawn by horses. Judging from present indications it will not be long ere the whole of the Parisian fire brigade material will be replaced with electric vehicles.

Goods Service Wanted for Surrey.

THE inauguration of the motor-car goods service between London and Tunbridge Wells, which we mentioned last week, is being keenly watched by agriculturists and market gardeners throughout the country. In the adjoining county of Surrey it has created a very lively interest, and people are asking why does not some enterprising financier-motorist institute a similar service for Epsom, Leatherhead, Guildford, and Godalming, on the route on which the horse-drawn parcels post service is carried. Such a venture would, doubtless, have a very good chance of success—if the Surrey police did not develop undue officiousness.

The "Contour" Road Books.

"THE 'Contour' Road Book of England" (Gall and Inglis) deals with the subject handled thoroughly, containing as it does 1,500 maps and plans. The maps which come first deal with England and Wales, in some forty handy sections, thus obviating the necessity of carrying a larger map, too often unmanageable except upon a table. One of the "Contours" strongest claims to favour will be found in the fact of its being self-contained—i.e., none of its maps or plans require unfolding. The 1,100 routes are each accompanied by a contour plan, as well as some useful information concerning the road itself. The plan enables the motorist to decide both the length and

gradient of a hill before approaching it. Altogether the "Contour" Road Book contains a very great deal of necessary information in a much condensed form. Also by Messrs. Gall and Inglis is "The Royal Road Book of England," a neat little pocket map bound in water-proof cloth. Contour is its feature, made clear by three hundred plans of principal routes. A map at the end of the book possesses the advantage of being folded in such a manner as to keep open at the part required for consultation.

More Complaints.

WRITING under the *nom de plume* of "Resident" in a recent issue of the *Essex Herald*, a correspondent appeals to the Local County Council to issue regulations as to motor-cars. "Resident" states that at present they seem to be driven at the sweet will of those in charge of them. He is labouring under a delusion. The motor-car is more regulated by law in this country than in any other. A glance at any daily paper will reveal the fact that their owners are constantly in court and the victims of heavy fines, for the breach, generally imaginary, of just such legislation as he clamours for.

Horse v. Motor-Car.

WHEN the account of a recent collision was given before a magistrate, two versions were recited. The driver of a horse and cart said his animal was standing still, and that the motor-car ran into it. On the other hand, the driver of the motor-car said he was at rest when the horse came prancing along and charged into his automobile. With such contradictory evidence the magistrates were, of course, on the side of the horse, and the owner of the motor-car was fined ten shillings and costs for "furious driving."

An Absurd Notice.

MOTORING in Surrey the other day we came upon a wide country road between Dorking and Holmwood, at the end of which stood a notice board warning drivers of traction engines and motor-cars against passing that way. Next we shall be warned to keep off the high road!

Motor-Cars' Freedom in Towns.

THERE is division in the camp of those who would hold the roads against the motor-car; and in the course of the lengthy correspondence on the subject that has been inflicted on the readers of the *Yorkshire Post*, we notice an interesting development. Some writers have suggested that they will be satisfied if the speed of motor-cars is reduced in country districts. As a Thirsk magistrate put it, "It is in the country where the danger exists and where the horse has nothing else to attract its attention when meeting a motor. In towns, there is comparatively little danger, as horses have so much to occupy their attention, and they get confidence through seeing other animals around them." So this worthy observer would allow the automobile license in towns but no liberty in the country. But is it the motor-car that is at fault? We are inclined to the view that if this J.P. could suggest some way of amusing horses in the country so that their minds should be occupied—as he declares is the case in towns—the whole difficulty would be solved, and horses and automobiles could move along together.

Motors the Friends of Horses.

LORD LLANGATTOCK is interested in many modern movements, and allowed the Church of England Society For the Promotion of Kindness to Animals to hold a meeting at South Lodge, Knightsbridge, on Friday last week. Interest was given to the occasion by a paper on "The Benefits which will Accrue to Horses from the General Use of Motor-vehicles," by the Hon. C. S.

Rolls. Not only did Mr. Rolls refer to the cleaner streets and cheaper transport that would result from the adoption of motor-cars, but he argued they would tend to improve the breed of horses by allowing the latter to be put to work of a suitable character. For riding and hunting the horse will always be employed, but the drudgery and the burden associated with horses employed to draw heavy loads will be materially alleviated as the automobile comes into general use. At the same meeting Mr. Shrapnell Smith gave an account of the Liverpool trials. Colonel Tomkinson, M.P., declared that the introduction of motors for transport purposes in war would prevent much cruelty, and a resolution was adopted to the effect that "the more general adoption of the motor-vehicle will lead to the alleviation of much animal suffering." Mr. Rolls certainly deserves the thanks of the industry for introducing the subject in such an acceptable way to a society that seeks to promote kindness to animals, and the many leading articles that have been written on the paper proves how ably he handled his congenial theme.

THE 50 H.P. NAPIER.

(Mr. Mark Mayhew, in Special Speed Driving Outfit, at the wheel.)

Hints to Drivers of Horses.

To the discussion that has been going on for some time in the columns of a leading Yorkshire daily with regard to motor-cars, Mr. Norman D. Macdonald, chairman of the Scottish Automobile Club, contributes a useful letter, in which he emphasizes two or three points known to motorists but obviously "caviare to the general," to borrow a phrase from Hamlet. It is generally the driver and not the horse that is seized with panic on the approach of a motor-vehicle—a fact which every motorist can confirm. Then, too, there are horses between shafts with inherent vices and tempers that are as excited when near a tramcar or a street organ as when in the vicinity of an automobile. To credit the motor-car with all the troubles caused by such animals is manifestly unsportsmanlike and unfair. Drivers, too, should recognise, as Mr. Macdonald points out, that the faster the motor-car is driven past a horse the better, because the horse sees less of it and has consequently less time in which to work up its agitation. If horse drivers realised the safety that exists in a quickly passing automobile they would not strive to reduce the rate of speed at present allowed by law.

Taxing Cars by Weight.

How frequently those who object to motor-cars make suggestions likely to defeat their own wishes is a fact known to motorists. Such an instance is afforded by the *Bristol Times*, which makes the proposal that motor-cars should be rated "at so much a cwt. on the weight of the car," and when caught "scorching" they, or the owners, should be heavily fined. Now, to tax automobiles according to their weight would be to offer up a fine prospect for the makers of weighing machines and the official class. It would drive motorists to aluminium bodies

and the lightest possible materials, with the result that the speed of the cars would be materially increased. Hence we should have more speed, more prosecutions, and more growls from the *Bristol Times*. Evidently the writer of the note did not know that automobiles have to pay a licence and that to tax by weight in the case of motor-cars is introducing a principle that would also have to operate with regard to horse-drawn vehicles and dogs. And then there would be growls indeed. Fortunately the *Bristol Times* is not the source of the Chancellor of the Exchequer's inspiration; for which small mercy we are sincerely thankful.

The Recent Demonstration.

It was said in many directions that the 1,000-mile trial of 1900 was partially responsible for awakening the antipathy of many rural Councillors against motor-cars. They recognised, as they had never done before, that the automobile was a moving force that promised to carry the people with it; and they, with full buccolic ardour, threatened pains and penalties to the pioneers. If the action of the Automobile Club was thus the indirect cause of recent local activity against motorists—a conclusion to which we do not assent—it must now be confessed that the Club has justified itself by the demonstrations before County Councillors which were so fully described in the *Journal* last week. The conversion of Councillors went on daily, and in private conversation as well as public utterance they acknowledged past prejudice and promised future fairness. With a fulness that indicated the importance of the occasion the general Press reported the proceedings with sympathy and intelligence; and the thanks of all engaged in the industry should be tendered to the Club and its officers for the energy, enthusiasm, and sacrifice with which the organisation was developed. Without such attributes no such successful result would have been possible.

A London Service Wanted.

THE coming of the "Tube" is leading to the exit of the omnibuses along the Holborn route, and all interested in the conveyance of Londoners from point to point are watching the development of passenger traffic in the capital with considerable interest. The Holborn line is not the only one that has suffered, for bus traffic along the main arteries of the City is being despoiled by enterprising "pirates" instituting new cross routes connecting with the electric railway. If great lumbering, cumbersome omnibuses, with two horses and uncivil conductors, can thus make profit, there should be remunerative employment for motor-car services in similar directions. Rapid services from the Strand to any of the stations of the Central London Railway should certainly be paying ventures, and we commend the idea to those interested in the subject.

A Motor-Car Service at Oxford.

THANKS to the enterprise of the Reading and District Motor-Car Company, Limited, Oxford has a motor-car service. Starting at nine o'clock in the morning and stopping about twelve hours later the cars run to various parts of the city at popular fares. The system is elastic: cars can be hired for the half-hour, hour, or as long as required. Private parties can also be arranged, and it is proposed to run pleasure trips to outlying places of interest.

America's Delay.

WHEN we consider what remarkably clever and inventive mechanics the Americans are, we must profess disappointment at their contributions to automobilism up to the present. True, they have given us the steam-car in a simple and popular form, and perhaps lead the way in electric traction; but in petrol motors they have done very little which can be called remarkable or revolutionary. Though there are a fair number of petrol cars made in America, none of them have

attracted the attention which French or English cars have won for themselves by their performances. Uncle Jonathan is as keen on an advertisement as any one else, and if he had speedy cars or any other notable improvements, the world would very soon be worried about them. We have great hopes, however, that ere long America will take a prominent place in automobilism. The bad state of her roads is, we believe, one of the causes which prevent rapid development. As an indication of their quality, we may mention that it recently took a car 18½ hours to do the 225 miles from Boston to New York; and this was classed as a record drive! It was accomplished, too, with a French-made engine. Speed cars could not hold together over such routes, and as the makers have no means of thoroughly testing their vehicles in fast travelling, they are much handicapped in turning out cars for the European markets.

A Motor Amuck.

FORTUNATELY the scorching motorist is a much rarer bird than the police would have us believe. Still he is to be seen sometimes. One was on the wing the other day in France, on the road from Maisons Laffitte to Paris. He collided with a pony trap, reduced it to wreck, scattered its three occupants about the road, made cat's meat of the pony, and continued his wild career without so much as a word of apology. Whilst looking round at the hue and cry which he raised he ran over an old man who was wheeling a perambulator, fortunately empty. The madman is reported to be still at large.

Blind Justice.

TRULY our legislators do but partially administer justice to the motorist. The inequality of the fines imposed for furious driving by the Benches of various parts may well set many a victim calculating on the cost of his crime. This week we record a batch of offences disposed of at a few shillings per head, yet all of them were clearly proven by mathematical plain-clothes P.C.'s who timed the offenders, stop watch in hand, from start to finish of a measured course, and bagged the lot. Last week at Nottingham, Mr. Belcher was fined £5 for a similar offence, by no means clearly proven, seeing that the witnesses called had no means of ascertaining the speed, and varied widely in estimating it. As Mr. Belcher's was, we think, the first offence in that district, it is just possible that he had on that account to pay through the nose for a novelty. Still this is poor consolation and we should be glad to see the various Benches rather more uniform in making the punishment fit the crime, if fine they must.

THE Automobile Club of America has adopted a new rule under which no vehicle is permitted to take part in a Club run unless operated by a member of the Club or carrying a member as a passenger.

AN American syndicate is reported to be negotiating for the purchase of the patent rights of the Panhard-Levassor Company, with a view to manufacturing the vehicles in America and so escape the tariff.

THE Automobile Company of America, Jersey City, N.J., are constructing a racing automobile for Colonel Max Fleishmann, of Cincinnati, Ohio, in which he expects to make the trip from Cincinnati to New York and back.

WILLIAM D. WARNER, of Chicago, fourteen years of age, is the youngest licensed motor-car driver of that city, and Samuel Harris, aged sixty-four, is the oldest. Both have passed the necessary examination, imposed by the city authorities, with credit.

FRESH attempts are being made to place American motor-cars upon the Australian market, but so far the results have not been encouraging. Some months ago the American papers gave considerable prominence to the Winton Company, of Cleveland, having shipped three motor-carriages to Sydney, "for use in the Government mail service in Australia," but, according to *Commercial Intelligence*, the Sydney Post Office officials profess to know nothing about them.

A RUN ACROSS FRANCE A RACER.

By A. R. SENNETT.

(Concluded from page 297.)

WITH regard to the tires, these are from every point of view the most unsatisfactory component of the automobile's anatomy. They are expensive, both in prime cost and up-keep; they are fickle and uncertain in the extreme, whilst they are productive of that which, above all other things, conspires to rob the automobilist of his enjoyment, viz., "side-slip," or as our French friends say, *dérapiage*. We feel, however, the sins of "side-slip" are often visited unmerited upon the pneumatic tire, and that mitigation, to a certain extent, will be effected by an improvement in vehicular design. The London omnibus has, unhappily, no pneumatic tires, yet it is very prone to indulge in this *glissant* skittishness. To entirely obliterate trouble, and we do not hesitate to say danger, from "side-slip," radical change of design is demanded, viz., the adoption of fore-carriage traction instead of rear-wheel propulsion. We are, however, persuaded that material modification would attend the employment of all four wheels as steerers. Every racing driver finds that the danger of splitting his cover in rapidly rounding corners is a real one. In this regard also we feel that the racer of the future will be fitted with larger wheels—all steering, and all of the same size—and all furnished with tires of the same diameter. For it is far more important in bad road travelling to prevent the tires of the

THE RACING CHAUFFEUR OF THE FUTURE.

Cliche d.]

[L'Automobile. Milan.]

steering wheels from descending into ruts and depressions than it is the trailing wheels. The increase of diameter of the two wheels should act beneficially upon the life of the tires, firstly, by reason of the number of revolutions for a journey of given length being decreased; secondly, in regard to the "rush" of the contained air. This, although its velocity may remain the same, would be advantageously effected from the fact that its heat emissivity would be accelerated by reason of the increased area exposed to radiation. The generation of heat from this cause on high-speed runs is surprising, and the careful *chauffeur* should not omit every opportunity of passing his hands round his tires, not only to ascertain their temperature, but also to localise the miscellaneous foreign substances, such as nails, pieces of barbed wire, and the like so often to be found secreting themselves with uncommendable modesty in the treads.

The reduction of weight is a *desideratum* more easily desired than effected, for great speeds spell great strength, and this applies to the ordinary touring carriage as well as to the racer; for the most desirable characteristic of the travelling carriage is that it shall be equipped with ample power and thus made capable of doing up-hill work at the Parliamentary limit. The reduction in weight should be set about with more common-sense than is displayed in many ways, but in particular with reference to providing covers to the chain wheel pinions, which, when allowed to remain uncovered, are a source of great danger. The mudguards also should, in our opinion, receive more attention from the makers, and should be mounted in the form usual upon cycles, for the waste of horse-power, by the use of such very wide "wings" as are employed upon the steering wheels, must be considerable.

Such a run across country at racing speed naturally sets one thinking as to what road speeds the future may have in store and what may be the limiting conditions. In this regard it would be interesting to ascertain what law the racing carriage doing a mile a minute is amenable to. For whereas wind pressure as affecting slow-speed carriages is almost negligible, it becomes, at express speed, a most important factor. What is wanted is a second Froude to arise and thoroughly investigate the matter; for such an investigation might materially influence the design of racing carriages by the elimination of erroneous deductions. For example, we are aware that there are those who hold that the shaping of the prow of the racer into "cut water," "shoe," or "torpedo" form is of little use, from the fact, as they suppose, that retardation, as regards atmospheric influences, is due almost entirely to the existence of a partial vacuum at the stern of the land yacht. In this relation we would suggest that a *chauffeur* possessing a racer should fix on to the back of his carriage a self-registering aneroid barometer and let us know what he finds to be the reduction in atmospheric pressure at different speeds. At present speed in common-road mechanical transport is limited more by the existence of more slowly moving vehicles and by pedestrians and animals than anything else. When one considers that we can to-day propel travellers over common roads at speeds in excess of those of express railway trains, one cannot but feel that it is highly probable that in many districts, roads between town and town will eventually be reserved for high speed mechanically-propelled transport only.

Our run over the course was pleasantly and successfully made, but this was due principally to the skill of "our" *chauffeur*. And it is fervently to be hoped that the drivers in the forthcoming interesting contest will successfully show the requisite skill with the equally requisite nerve we are proud to know the racing *chauffeur* possesses, for whereas a grave accident would have a retarding influence upon progress, the competition, if successfully carried through, will, without doubt, have a beneficial effect in popularising *automobilisme à grande vitesse*.

At a special town meeting Stockbridge, Mass., has decided that no automobile shall proceed through its streets at a speed in excess of four miles per hour. Progress must come slowly to the citizens of Stockbridge.

THE Bombay Municipal Corporation has resolved to request the municipal commissioners to report whether it would be advisable to use motor-cars and cycles in substitution of horse traction for fire-engines.

THE *Whitehall Review* remarks that "the popularity of the motor grows apace, and the latest designs are an enormous improvement on those of even a year ago. In a year or two there is no doubt most people will desert Mayfair in the summer in favour of the country, the automobile making this so easy."

THE Austrian-Hungarian Customs authorities have decided that accumulator batteries for motor-cars which consist of wooden cases, lined with gutta-percha, in which the lead plates are fitted, will in future be treated as lead when passing through the Custom House, without regard to the rubber or gutta-percha, the weight of which must not exceed 8 per cent. of the total.

WE briefly mentioned in our last issue that the Milne petrol lorry, A1 of the trials, was being fitted up by the Liverpool Corporation as a high-speed water-cart under the direction of Mr. Brodie, the city engineer. A test was made towards the end of last week in London Road, and attracted great attention. The results have not yet been made known officially, but to ordinary onlookers the motor-vehicle appeared to sprinkle water at something like twice the rate of the ordinary horse-drawn cart.

"THE motor-wagon has come to stay," says the *Financier*. "Of itself it presages a great constructive industry, and in respect of the services it renders it may revolutionise the industrial conditions of the United Kingdom. It may, for example, accelerate the notable tendency of manufacturers to quit great cities for country districts, where land is cheap, where there is plenty of room for the expansion of a business, and where working expenses generally are bound to be less."

FLOTSAM AND JETSAM.

BY "FLANEUR."

Punch was very happy the other week in its suggested automobile regulations, which, by a *reductio ad absurdum*, more than hinted at the fatuity of the "ten miles an hour" and other proposals evolved by certain County Councillors. It was much less happy, however, in its issue of June 12th, when it published a drawing, spirited but fallacious, by Mr. Raven Hill, over the title of "Brothers in Adversity." A farmer in a dogcart, tugging vainly at the reins, is alongside a motor-car, to the driver of which he shouts: "Pull up, you fool! The mare's bolting." To this the automobilist is represented as replying: "So's the car!" The road is level. Motor-cars, Mr. Raven Hill may be informed, are incapable of "bolting" under any conceivable circumstances on the level, and something exceedingly unusual would have to occur to the brakes before such a thing could happen down hill, and a very steep hill, too, would be required to effect the consummation. And yet this idea of motor-car "uncontrollableness," to coin a word for the occasion, is still rife in many quarters. With how much greater justice it might be directed towards the horse!

It is safe to say that if a sequence of automobile accidents had occurred during the last few weeks of even half the seriousness of certain recent horse catastrophes, the country would have simply seethed with indignation. Since the grievous *char-à-banc* disaster at Epsom, there have been numerous other accidents due to the horse. At Camelford, a party of children were run away with, serious results ensuing; a stage-coach accident occurred in Northumberland Avenue; a bishop has been thrown out of his carriage; a cyclist has been fatally impaled on a shaft and carried a long distance before the horse could be stopped; and so the tale goes on. At this rate we shall soon be rivalling France, the latest statistics as to which show that in the month of April no less than sixty-six deaths and 724 injuries resulted from the use of horses, eighteen deaths and 154 injuries from railways, two deaths and sixty-five injuries from bicycles, and three deaths and fifty-six injuries from automobiles.

So far as the London public is concerned, however, the most remarkable circumstance is the equanimity with which the constant presence of filth particles in the air, particularly in wood-paved districts, is tolerated. A friend of mine who is the leading throat specialist in London has described the evils of this pollution in emphatic terms, and it is largely responsible for the throat ailments, often very serious, which prevail in the West-end, particularly in hot weather. When a wind gets up, and blows this pulverised matter about, it becomes painful to the eyes as well; in fact, when driving down to Sheen House, during the County Council demonstrations, I was unfortunate enough to suffer considerably in this respect. The amount of animal matter on the ground in Horse Guards Avenue, too, as people walked about inspecting the cars, was not only annoying, but a curious object-lesson in favour of the horseless vehicles. No wonder that Earl Grey remarked that the motor-car needed no scavenger behind it.

In the presence of no small amount of keen rivalry among motor-car owners as to the merits of their vehicles and their own particular prowess or mechanical aptitude, it is pleasant on occasion to encounter a spontaneous tribute from one *chauffeur* to the abilities of another. Various interesting cases of this kind have come under my notice from time to time, and some of them, I think, are especially worthy of mention. The first is chiefly noteworthy for its sequel. On the day of the Automobile Club's demonstration to Chief Constables there were more cars than Constables, and the owner of a smart *voiturette* took down to Sheen House as his passenger not a police official, but a well-known member of the Club Committee. Later in the day the latter gentleman, after he had alighted at Whitehall Court, expressed unstinted admiration for the way in which the car had

been piloted through the traffic. "He always did the right thing," were the words he used with respect to the owner of the car, and this comprehensive praise, be it said, which was the frank testimony of an expert in traffic conditions, was not uttered by way of compliment in the driver's hearing, but to others who were about.

THE sequel is still more interesting. When the time for the County Councillors' demonstrations came round in due course, it happened that the subject of the encomium above quoted was without a car. Like several other *chauffeurs* in a similar position, he had accepted an advantageous offer for his vehicle, and parted with it before a new one could be got ready for delivery. It happened, therefore, that he accepted a seat on the second day of the demonstrations in the "spider" of a *voiturette* precisely similar to the one with which he had just parted. Subsequently, I met him on the lawn at Sheen House, and, on my enquiring why he was thus driven instead of driving, he explained the facts as to the sale of his car, and then remarked, with no small enthusiasm, "What a splendid driver he is!" the "he" being, of course, the owner of the car. Here was praise from Sir Hubert indeed! The very driver whose expertness had previously been extolled was now expatiating on the skill of another, and on the very same type of car. This is the more remarkable when one remembers how much more nervous, as a rule, is every automobilist when he is being driven, as compared with when he is himself driving.

A THIRD case which may be mentioned is that of the owner of a fine 12 h.p. car, who was describing to me lately sundry improvements of detail which he had effected in his vehicle. Now it happens that he has enjoyed unusual opportunities of mastering the mechanism of a petrol-driven car, and knows more about its management than most people; yet he was not above confessing that the innovations he had embodied were the result of suggestions from a well-known amateur, of whose mechanical genius he spoke in terms of the highest commendation. Finally he remarked—and it is the originality of the observation that leads me to refer to it herewith—"I have such confidence in Mr. ———'s knowledge, that if he told me that a piece of Gorgonzola cheese in the carburettor would improve the running of my car, I would put that piece of cheese in straight away!" And he meant it.

FRENCH journals are quick to seize upon any incident of street traffic which affords the opportunity for a smile. "Even in the most serious circumstances," remarks the *Auto-Vélo*, "one always finds a humorous note." It then proceeds to relate how, when an explosion occurred the other day at a factory, the police commissary of the district was anxious to hasten to the spot. He chartered a carriage accordingly, driven by a girl "cabman" of twenty years of age, and set off along with his secretary and three policemen. On the way three more "agents" were overtaken, and the commissary stopped the vehicle and ordered them to clamber up behind. As the word to go was given, however, the weight of the extra men caused the cab to tilt backwards, with the horse suspended in mid air. Tableau! Everybody was thrown overboard, but the commissary was the first to scramble to his feet, and anxious to proceed. This, however, was impossible, as the vehicle was in fragments. Then a motor-car appeared on the scene, a manufacturer in the vicinity having brought one up and placed it at the disposal of the commissary, who mounted it forthwith. Just as he was starting off, the carriage and pair of M. Lépine, the well-known head of the Paris police, swept by, but in the next hundred yards the motor-car passed him, and the commissary arrived before his chief. It is hoped that there will now be one police commissary at least who will not treat Parisian *chauffeurs* with severity!

SOME high-falutin' twaddle of the most laughable description appears in the *Councillor and Guardian* as the result of the recent demonstrations. The style of the ponderous editorial which that journal has published may be gauged by the following extract. The County Councillors, it says, "have been pressed

to take gratuitous motor trips in charming and attractive districts, and the extra bait—greedily snapped at by a small minority of such councillors—has been held out of associating for a day, or riding in the same car, with baronets, lords, earls, or even a duke. To these attractions another bribe, conceived on a more lavish and yet subtle scale, has been devised and executed. Last Saturday that wealthy and somewhat exclusive body the Automobile Club, who have secured Sheen House, the former home of the Comte de Paris, as their country club-house, entertained 150 councillors, from thirteen different counties, to a *recherche* luncheon, after a run on the very best and most expensive machines, through lovely roads to Richmond."

EVERY clause of this rhodomontade is in violent opposition to actual fact. If the district between Whitehall and Sheen be "charming and attractive"—why this tautology?—the *Councillor and Guardian* scribe is indeed easily satisfied. The "bait" of driving with "baronets, lords, earls, or even a duke" was most assuredly not held out to County Councillors, who had no means of knowing, when they received their invitations, who was likely to be present beyond the chairman for the day. As to a simple cold luncheon being a "bribe," the scribe is not particularly respectful to his patrons, the Councillors themselves. One is tempted to retort, as did Samuel Foote when an officious person pulled his elbow and told him that his handkerchief was hanging out of his pocket, "Sir, you appear to know the company better than I do." The Councillors themselves, none the less, will scarcely relish the reflection on their honesty which the scribe lays on with so broad a brush. It has also to be pointed out that the Automobile Club is not a wealthy body; in fact, it has one of the poorest club-houses in London. It has not "secured Sheen House" in any shape or form, wholly or in part. The cars which took the Councillors to Sheen were not necessarily "the very best and most expensive machines"; they were the property of whatever members volunteered their services, and were in no sense picked. As a matter of fact, some were of the very cheapest types. The statement that the cars were all the "very best and most expensive," if it were true, would tell against the scribe, because cars of this description are the fastest, and would have been least likely to convert the Councillors, so that if artful scheming was the chief aim of the Automobile Club no costly car would have been suffered to appear. As to "lovely roads to Richmond" where are they? There is not a single route to Sheen House from Whitehall Court which is not an endless continuity of bumps, and bricks and mortar are never left behind all the way. "Lovely roads!" What a travesty of the case!

IN another place the article refers to the "fair, wide roads to Richmond." Again I say, where are they? It would have been a much better exposition of the capacities of the respective vehicles if they could have been driven on the open road instead of along a traffic route throughout. But the scribe excels himself when he describes the Automobile Club's luncheon—he knows so little about the whole business that he only refers to one—as a "barefaced attempt to change their opinions by appealing to their stomachs and by flattering their appetites. If it is right that a complete revolution should be brought about in our highway administration, let the change be produced by weighty intellectual arguments, and not after this flashy fashion." Methinks the amount of argument the Club has issued on the subject during the last twelve months should be both weighty and intellectual enough to satisfy the brilliant celebration of the *Councillor and Guardian* scribe; but the upshot of the matter is that he palpably knows nothing of his subject, and is not worth further words.

THE latest addition to monthly motor-car literature is the *Reuling Automobile Club Gazette*, which will in future be the official organ of that Club. Besides a diary of Club meetings, runs, competitions, etc., the first number contains much which members will find interesting, including a humorous cartoon depicting a local event, and a sale and exchange column.

THE WESTON STEAM CAR.

THE other afternoon we had an opportunity of inspecting one of the new Weston steam cars which have lately been introduced into this country by Weston Motors, of 14, Mortimer Street, London, W. Generally speaking the car follows the lines and arrangement of the now familiar light steam vehicle, although in the details several variations are to be noticed. The boiler is of the quick-steaming tubular type, it being fitted with 300 $\frac{1}{2}$ -inch copper tubes. One of the special features of the Weston car is the method of starting the fire. At one side of the main burner is a starting box in which is a small cup. By means of a little handle a small quantity of petrol is allowed to flow into this cup from the main supply tank. The petrol in the cup is then ignited by a match; when it has nearly burnt itself out, a second handle is turned, to allow the pilot light to be started. The main burner is regulated by means of a small hand-wheel within convenient reach of the driver's right-hand. By means of this wheel the power of the fire can be varied as desired, according to the quantity of steam required whilst travelling; also when it is necessary to leave the car for a short time, as in making calls, the main fire may be extinguished by means of the

THE WESTON STEAM CAR.

hand-wheel, the pilot light, which is always burning, maintaining a sufficient pressure of steam to allow the car to start away when the passengers are ready. A full head of steam can be raised from cold within ten minutes of starting the fire. The working steam pressure is 180 lbs. per square inch, a safety valve blowing off when 225 lbs. is reached. The water tank has a capacity of 26 $\frac{1}{2}$ gallons, sufficient for a run of twenty to twenty-five miles, according to the character of the roads traversed. Of petrol 6 $\frac{1}{2}$ gallons can be carried in the tank, this being sufficient for from fifty to fifty-five miles. The engine is of the vertical two-cylinder reversing type of 6 h.p. It is located in front of the boiler and transmits its power to the rear axle by a centrally-located chain. In addition to an automatic water pump, an auxiliary hand pump is provided, and in connection with the latter is a regulator under the control of the driver. The body of the car is neatly upholstered and painted; it is supported on springs of the gondola pattern on a tubular frame, which in turn is carried on 28 in. cycle-type wheels, shod with 2 $\frac{1}{2}$ in. pneumatic tires. Tiller steering is provided, while a pedal actuates a band brake on the rear axle, this acting equally well be the car running backwards or forward. The car can average a speed of sixteen miles an hour, while as to its hill-climbing capabilities we may mention that it has been driven up Netherall Gardens, N.W.—a grade of about one in five—at a speed of eight miles per hour.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Carage open day and night, all cars in stock, 100-104, Long Acre, W.C.

LADY MOTOR-CAR DRIVERS.

WE hear that the proprietor of the Liverpool and Birkenhead Motor-car Works has invested in a novelty in the shape of a lady-motorist, who has lately joined his squad of drivers. Truly, the possibilities for ladies in the future of the motor world are enormous, and how expansive is the view from the present summit of the hill of motordom. As we ponder on the vista which opens up before this particular lady and many more who may follow in her steps we cannot but wonder that crowds of fair creatures (and "stylish," as the advertisement stipulated) have not clamoured for such a post as this.

THIS

OR

THIS.

We presume that the said lady is required to perform the same duties as the other drivers attached to the establishment whose staff she has now joined—that is, taking intending clients for preliminary trial-spins, trying new cars, driving hirers of cars who cannot drive themselves, and teaching clients to drive, etc. If the lady is young and charming—as no doubt she is—we foresee a big trade for the motor depot in Berry Street, Liverpool; for who would not "mote," who could, with a fair hand to guide the barque on its airy flight and to initiate the attentive novice into the mysteries of the machine, and a sweet voice to wheedle the cheque-book from one's pocket.

On a delicate point we profess a slight feeling of doubt.

STUDYING THE MECHANISM.

Will the lady don a peaked leather cap, or wear a toque and veil? Shall it be mackintosh overalls or a frilled skirt? And what a sight to see the female form divine prostrate beneath the refractory self-propelled nag! Then think what a hay-time for the drivers, students, and motor workers when this moting butterfly alighted amidst the busy buzzings of the humdrum life of the motor workshop. Again, if this said butterfly arrived

in an unsophisticated state of mind as regards the fearfully and wonderfully made gee-gee, we confess we perspire with envy of the lucky beggar to whom falls the duty of enlightening the dear creature. We suggest probable sweet little *lête-à-têtes* in the suburbs—two heads bent as one over induction coils and sparking plugs, four busy hands contesting and making a mash of the difficulties of lubrication, or the airy barque floating itself into the ditch in blissful moments when steering levers are forgotten. Our forecast prophesies shoals of eager customers (not ladies!), all simply dying to purchase and solve the problem "motor."

EN ROUTE.

If the lady under discussion is not a ready learner in the engineering line, we shall wonder greatly, in these modern days when women are making headway in almost every trade; but if, on the other hand, she is of a mechanical and business turn of mind, and is successful in this line, our mind's eye foresees a little picture of the butterfly on the flit with the chief driver, or manager, or fascinating student, say, and a probable rival motor factory further off. Ah! that such should be the way of the world, that motor-men as well as others should be soft-hearted.

ANITA.

MESSRS. COOKE AND WADE have opened motor-car show-rooms in the Cutlers' Hall, Sheffield.

MR. J. W. STOCKS intends starting from Land's End, on Sunday morning next, on an end-to-end tour on his Ariel tricycle.

MESSRS. ARTHUR JONES AND H. P. DYER, two Cleveland business men, left New York the other Saturday for a leisurely transcontinental automobile trip, which they expect will terminate in San Francisco within ninety days.

ON Saturday last, the 15th inst., the members of the Reading Automobile Club held a run to Fleet, near Aldershot. To-day, the 22nd inst., they will hold a run from Reading to Swallowfield Park.

MR. J. LEONARD, of Western Terrace, Phoenix Park, Dublin, has discovered that some motor-car owners actually drive their vehicles with a total disregard for the rights of other users of the King's Highway. This discovery comes late in the day, for motorists long ago found owners of horse-drawn vehicles similarly negligent of the rights of others.

THE Auto-Carriage Company, Limited, has been registered with a capital of £20,000, to adopt an agreement with L. Ruef and F. Lane, and to carry on the business of manufacturers and letters to hire of motor-cars, etc. The first directors are F. Lane and C. S. Gulbenkian. The registered office is at 106, Great Portland Street, London, W.

Milling in a recent issue remarks: "Millers have frequently written to us complaining of the great wear and tear of horse flesh, and for this reason alone we fully expected to see quite a number of the trade at George's Dock, Liverpool, in connection with the trials of heavy motor-vehicles. Several who were present decided to buy motor-wagons, and it is evident that it will not be long before we see a great revolution in our modes of haulage."

HILL CLIMBING AT TILBURSTOW.

THERE was an ominous look in the sky and more than a suggestion of keenness in the wind when we decided to go to Tilburstow and witness the English Motor Club's Hill-Climbing Contest, on Saturday last. This resolve was taken soon after mid-day in town, and was immediately followed by a positive craving for two long-forgotten comrades—macintosh and umbrella. A glance at a timetable, however, convinced us that we must forego the comfort of their companionship if we were to catch the two-something from Cannon Street to Godstone.

On the way down we scraped acquaintance with two men from a far country. They were open to conviction regarding the advantages of motoring over every other kind of locomotion, but, as they explained, their country was a hilly one, and they still had some doubts; hence their journey to Tilburstow. We are glad to record that before the day was out their conversion was complete.

At a wayside station we picked up a couple of rustics who informed us that they were going to the hill to see the car that won the big French race! Not one of us had the moral courage to damp their enthusiasm with the cold waters of truth. On

MR. EGERTON'S 12 H.P. DARRACQ.

MR. EDGE ON THE 50 H.P. NAPIER.

MR. C. JARROTT ON THE 10 H.P. DE DION SPIDER.

MR. GINDER ON THE LOCOMOBILE.

MR. S. T. HONE ON 4½ H.P. DE DION VOITURETTE.

In spite of a liberal supply of fuel, and a modest amount of lubrication taken in by the way, the outlook was decidedly gloomy as seen through the opaque dinginess of that part of Cannon Street station which most nearly approaches the sky. As little consolation was to be derived from looking heavenwards, we turned our eyes, whilst waiting for the train, to the more mundane things to be seen on a bookstall, and from these derived some comfort. As the train crossed the river out came the sun, to shine for the rest of the day, too.

the hill we afterwards found that the same pleasing fallacy was prevalent, a gratifying proof that the much handicapped Englishman who will uphold the honour of his country on a foreign road can do much to popularise the new order of things in the mind of the masses.

A pretty country walk of about two miles, down a lane and up the reverse, or southern slope of Tilburstow Hill, brought us to the summit just about the starting hour—4 p.m. From here to the starting point—a bridge which crosses a small stream at

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Carage open day and night, all cars in stock, 100-104, Long Acre, W.C.

the foot of the northern slope—is 1,214 yards, or about three-quarters of a mile. The gradients of the hill from the bridge at the foot are—1 in 17 for 408 yards, 1 in 13 for 333 yards, 1 in 11.9 for 175 yards, 1 in 11.5 for 38 yards, and 1 in 87 for 260 yards to the summit. To make the course just two-thirds of a mile the finishing point was fixed forty-one yards short of the summit. The road winds in and out of timber, so that one can seldom see much more than a hundred yards of it at one time. By climbing the wooded banks which crown the crest, however, the greater part of the ascent is visible.

Scarcely had we ascertained these interesting facts when a shout from the crowd that had taken possession of the corner of a lane, which leads to Bletchingly, two hundred yards lower down, set those on top fluttering with anticipation. A moment later three competitors mounted the slope in a bunch and entered the comparatively level stretch which led to home. Among the first to cross the line was Mr. C. K. Gregson on a $3\frac{1}{2}$ h.p. De Dion car (No. 34). Mr. W. J. Westfield, pedalling hard on a $1\frac{1}{2}$ h.p. De Dion tricycle (No. 14), was next, followed by a 7 h.p. Motor Manufacturing Company's car (No. 27). The actual value of order of arrival was, however, discounted by two separate handicaps: one for the class in which each vehicle competed, and one for final order of merit for the whole.

A long interval followed, punctuated by the arrival of many dismounted non-competing cyclists, panting, perspiring, and pushing, a fair tribute to the steepness of the course. Next came in rapid succession a mixed lot of light cars, some with but one passenger, others with family parties, and one with a lunch basket. Interspersed were motor-bicycles and tricycles, their riders well over the handles, and pedalling hard in spite of hints dropped by the N.C.U. as to possible penalties. About the middle of the procession came Mrs. Kennard on a $2\frac{3}{4}$ h.p. De Dion tricycle with Whippet trailer, looking cool and happy, which the *mecanicien* who pedalled hard from the back seat did not. More cars, some groaning as if in pain, and others gliding past noiselessly, noticeable amongst the latter the $4\frac{1}{2}$ h.p. Empress (No. 28), driven by young Cusins-Nixon, and the Enchantress, one of the new Weston steam cars, which, however, was not competing. An exciting finish to the lay eye was provided by Mr. Begbie passing Mr. Heard within fifty yards of home, both driving Century motor tandems. The next few arrivals at the summit included Mr. Jack Lawson on a 8 h.p. Panhard (No. 44), Mr. J. H. Gladding and three passengers on a 9 h.p. Napier (No. 38), and the three Locomobile steam-cars (Nos. 21, 22 and 20) driven respectively by Messrs. Ginder, Letts, and Stevens, the easy way in which the latter negotiated the hill being much commented upon.

Heavier cars which next began to arrive raised expectation to its highest pitch. Mr. Mark Mayhew came along at a terrific pace in his 20 h.p. Panhard. Then a roar from below, a rushing sound as of a mighty wind, as a shout of "Here he comes" from all sides, apprised us, ere we had time to scuttle up the bank, that the shade of Elijah, in a halo of dust, was in our midst. Before we realised what had happened Mr. Edge had pulled up his world-renowned 50 h.p. Napier thirty yards further on. A few more large cars came up well, then, the last having arrived, we walked over the battle-field and came to the pleasant village of Godstone, about the centre of which is the old-fashioned Clayton Arms Hotel.

Village and inn were alive with motorists. About the streets of the former wise men led young horses amidst standing and moving cars, that they might know the smell of petrol; and from cellar to garret of the latter were signs of that prosperity which has come to many a village since Englishmen, and Englishwomen too, have thrown off their allegiance to railways. Relatively very few of the competitors and visitors stayed for the dinner at the Clayton Arms, which followed the competition, but the repast in the ancient *salle* of the hostelry with its quaint old ceilings and decorations was not the least pleasant part of the day's proceedings. About thirty sat down to the dinner, among this number being Mr. Mark Mayhew (in the chair), Mr. F. W. Baily, Mr. S. F. Edge, Mr. C. Jarrott, Mr. G. H. Smith, Mr. Napier, Mr. W. Letts, Mr. S. Begbie, and Mr.

A. W. Heard. Shortly after 8 p.m. a move was made for the courtyard, in which, in a few moments, the now familiar sound of motors in operation was heard, and one by one the motor-vehicles, each with its complement of passengers, took their departure to various destinations, while others not so fortunate made their way home a wheel or by train.

The event was undoubtedly a great success. As has already been stated in these columns, the competition was divided into the following sections:—(1) Motor-bicycles; (2) Motor-tricycles up to 3 h.p.; (3) Motor-tricycles above 3 h.p.; (4) Motor quadricycles up to $3\frac{1}{2}$ h.p.; (5) Cars up to 7 h.p.; (6) Cars up to 9 h.p.; (7) Cars up to 16 h.p.; and (8) Large cars above 16 h.p. When the list of entries was closed it was found that in Class 1 six machines had been entered, in Class 2 eight, in Class 3 two, in Class 4 two, in Class 5 seventeen, in Class 6 three, in Class 7 six, and in Class 8 three, a total of forty-seven, out of which thirty-seven actually started. The following are the official times and order of placing.

CLASS HANDICAPS.

CLASS 1.				No. of persons carried.	H'cap start allowed.	Actual time.
Result.	Owner.	H.P.	Machine.			
1.	H. J. Lamb	$1\frac{1}{2}$	Werner bicycle	1	0 20	2 6 4.5
2.	J. Leonard	$1\frac{1}{2}$	" "	1	scratch	2 2 2.5
3.	T. H. Tessier	$1\frac{1}{2}$	" "	1	"	2 7 2.5
CLASS 2.				No. of persons carried.	H'cap start allowed.	Actual time.
Result.	Owner.	H.P.	Machine.			
1.	F. Flutter	$2\frac{3}{4}$	De Dion tricycle	1	0 15	1 45
2.	T. Parrish	$2\frac{3}{4}$	" "	1	0 15	1 46
3.	R. Denniss	$2\frac{3}{4}$	Speed King tricycle	1	0 15	1 52 2.5
	M. Moyle	3	De Dion tricycle	1	scratch	1 44 4.5
	T. L. Spencer	$2\frac{3}{4}$	M.M.C. tricycle	1	0 15	2 21 3.5
	W. J. Westfield	$1\frac{1}{2}$	De Dion tricycle	1	0 50	2 32 2.5
	L. Jones	$1\frac{1}{2}$	De Dion tricycle	1	0 50	3 37 2.5
CLASS 3.				No. of persons carried.	H'cap start allowed.	Actual time.
Result.	Owner.	H.P.	Machine.			
1.	T. Maltby, jnr.	5	De Dion tricycle	1	0 10	1 40 3.5
2.	C. Jarrott	8	De Dion tricycle	1	scratch	1 42 2.5
CLASS 4.				No. of persons carried.	H'cap start allowed.	Actual time.
Result.	Owner.	H.P.	Machine.			
1.	Mrs. Kennard	$2\frac{3}{4}$	De Dion tricycle and trailer	2	0 25	4 49
CLASS 5.				No. of persons carried.	H'cap start allowed.	Actual time.
Result.	Owner.	H.P.	Machine.			
1.	C. K. Gregson	$3\frac{1}{2}$	De Dion voiturette	1	3 35	3 18 2.5
2.	S. T. Hone	$4\frac{1}{2}$	De Dion voiturette	2	2 10	3 13
3.	A. Ginder	$5\frac{1}{2}$	Locomobile	2	scratch	1 46 3.5
4.	A. E. Crowdy	6	Darracq	2	40	2 37 1.5
	T. J. Morse	$5\frac{1}{2}$	Locomobile	2	scratch	2 12 1.5
	W. M. Letts	$5\frac{1}{2}$	Locomobile	2	scratch	2 25 2.5
	E. G. Stevens	$5\frac{1}{2}$	Locomobile	2	scratch	2 40 1.5
	S. D. Begbie	5	Century tandem	2	10	2 40 2.5
	A. W. Heard	5	Century tandem	2	10	3 24 4.5
	H. Johnson	5	Peugeot	2	2 10	5 18 4.5
	G. H. Smith	$4\frac{1}{2}$	Empress	2	2 10	5 52 4.5

Result.	Owner.	H.P.	Machine.			
1.	S. F. Edge	50	Napier	2	scratch	1 7 4.5
	M. Mayhew	20	Panhard	2	15	1 27

HANDICAP FOR TOTAL ENTRIES.

1.	C. K. Gregson	$3\frac{1}{2}$	De Dion voiturette	1	3 55	3 18 2.5
2.	S. T. Hone	$4\frac{1}{2}$	De Dion voiturette	1	2 30	3 13
3.	C. Jarrott	10	De Dion Spider	1	35	1 37 1.5
4.	C. Jarrott	16	Panhard	1	50	1 52 2.5
5.	H. J. Lamb	$1\frac{1}{2}$	Werner bicycle	1	1 2	2 6 4.5
6.	S. F. Edge	50	Napier	2	scratch	1 7 4.5

It will be noticed that in several cases it was not the fastest vehicle which secured the premier positions in the awards; this is accounted for by the handicap allowances, and here it may be mentioned that some surprise and amusement were caused by Mr. Gregson climbing the hill in 17 sec. less than his handicap time.

We may add that Messrs. F. T. Bidlake and Mr. H. J. Swindley acted as the timekeepers. Mr. Edge, on the big Napier, naturally made the fastest time. Comparing the results with last year, there was an all-round reduction in the times, with the curious exception of the tricycles. At the 1900 competition, Mr. C. Jarrott, on a De Dion tricycle, climbed the hill in 1 min. 36 1-5sec.; this year, on a more powerful machine, his time was 1 min. 42 2-5sec., Mr. Maltby making the best record with 1 min. 40 3-5sec.

ON PURCHASING SECOND-HAND CARS.

PERHAPS the most inveterate time-tax on the "hardened automobilist" (the epithet, which the writer lately heard applied to an enthusiastic devotee of the motor, seems almost worthy to take rank with the cabman's description of Mr. Grossmith) is, with the present influx of new recruits to the movement—the time is past for alluding to it as a *pastime*—the demand for advice as to the acquisition of their cars. Where the purchase of new machines is in question, such advice is usually given freely and with judgment, whether always unbiassed or not lies not with us to ask; but when secondhand cars are the subject of inquiry, it is not so easy to advise, and the cautious motorist hesitates to express an opinion without more consideration than, perhaps, he is able to give to the particular case. The uninstructed novice, however, to whom a car is a car, is liable to be tempted by an apparent bargain, and though such are to be had, the probabilities are that in the absence of expert advice the result will be disappointing. There is, notwithstanding, the consideration that defects in a car, if it be not an utterly bad one, can be remedied, and such complete disappointment as may, for instance, follow a deal in hay-motors is a very unlikely contingency; and an enumeration of the points to be considered in appraising a second-hand vehicle may be of some assistance to those intending to purchase such.

The prudence of considering only the vehicles of the few old-established firms will be especially obvious, as, except as a speculation for a man of mechanical tastes the purchase of more or less experimental and discarded patterns of newer makers will be little likely to prove satisfactory; while the probable facility of obtaining replacement of worn parts at a reasonable cost should be taken into consideration. Large and low-powered cars will generally be in better condition after a given amount of travelling than faster ones; while light voiturettes, more particularly with regard to their small high-speed engines, will depreciate rapidly with moderately hard wear, though cycles have, as a rule, a long life, barring the result of accident, and depreciate more owing to the demand for more power and to their diminution in popularity than to any intrinsic deterioration.

The first thing to attract the 'untechnical critic's eye, namely the exterior appearance of a vehicle, is, it is needless to say, of little importance; paint and varnish deteriorate rapidly under automobile conditions, and the cost of restoring them is sufficiently well-known, as is also that of tire renewal; but, in the case of solid-tired cars more particularly, the state of the rims is some indication of the wear they have suffered. The wheels should be examined for truth and correct tracking, while—especially where light vehicles are concerned—a back and front view of the car will show whether any "splaying" or convergence of the tops of the wheels betrays weakness or excessive loading of the axles. A trial trip will presumably be forthcoming, and though a single bad performance will not damn a car—or few indeed would be saved—the owner may be expected to show her if possible at her best, and an opportunity will be afforded of noting excessive rattle, jar, or looseness of parts, state of brakes, and hill-climbing powers, which should if practicable be tested on gradients familiar to the purchaser. Where ball-bearings exist they should, or one of the main ones at least, be inspected for wear, loose cups, etc., and in default of this by spinning, shaking, and so on, when the axle is raised by a jack. The raising of the back axle, so that both wheels are off the ground, will enable some idea of the condition of the differential gear to be gained;

when one wheel is revolved the other should rotate in the opposite direction freely and without too much backlash, where a live axle is in question; where it is on the countershaft there is more difficulty in seeing this, except in cars where its pinions are open to inspection.

With a gear-driven car, the gears should on no account be left unexamined, as their condition is an excellent index to its state of health and the amount of care it has received; the amount of wear on the faces of the teeth is of course more significant than the battering of their ends due to careless changing, while looseness of the gear-shaft bearings may be looked for at the same time.

Last, but not least, the engine itself will claim attention. Its compression and tightness in main and piston-rod bearings can usually be tested with the starting handle, though any serious looseness in these will be manifested by a knock when the engine is running; but perhaps the best test of the age and experience of an engine lies—as with a horse—in its teeth, namely, in the state of the pinions of the half-speed or valve-shaft, which should have a pretty long life, and hence are not likely to have been replaced—accidents apart—unless it has arrived at the stage of having a thorough and extensive repair. If these are badly worn, one would be inclined to think its miles had run well into the tens of thousands. Though the merest generalisation is all that is possible, without considering a particular case, no scientific method of integrating the various observations which are here suggested can be supplied to take the place of experience and common sense on the part of the intending purchaser of a second-hand car, who if he be devoid of the first will be well advised to call in a reliable opinion—if available—before making up his mind.

R. W. BUTTEMER.

FIRED by the success scored by the Ayscoughfee Fête Committee in their motor-car meet on Whit Monday, Grantham is desirous of arranging a similar attraction on August Bank Holiday.

AN alcohol motor-vehicle speed contest is being organised for the 7th July between Paris and Braisne, a distance of 127 kilometres. There will be four classes, ranging from voiturettes up to big cars. It is also proposed to organise a kilometre contest for automobiles propelled by motors consuming alcohol, over a straight course at Braisne.

MESSRS. WORSNOP AND CO.'S ACETYLROID MOTOR-CAR LAMP.
(See page 281, ante.)

THE wager of 10,000frs. between M. Cannello and M. Charron, to the effect that the former should produce within three months a car weighing not more than 1,200 kilogrammes and capable of doing two kilometres in one minute, is technically lost by M. Cannello, who is not quite ready with his car, and has asked for more time. In a very sportsmanlike way, however, M. Charron has foregone his claim to the stakes, and is willing to wait until the car is ready. Moreover, he is still so confident that he is ready to wager another 10,000frs. and wait even another three months.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

CONTINENTAL NOTES.

BY AUTOMAN.

MY remarks on the lessons to be learned from the Paris-Bordeaux race, in connection with the running of the Napier car, have evidently not been quite understood by Mr. Edge, and I am glad that he brings the fact forward in his letter to the *Journal* of last Saturday. I am glad, because the whole object of my criticism is for the benefit and improvement of British manufacture of motor-cars in comparison with foreign, and particularly French, competition. I say particularly French, because undoubtedly France is a full year or more in advance of us, and it is only by first clearly understanding the why and the wherefore that the British manufacturer can bring himself up to date, as I believe he will do in the end.

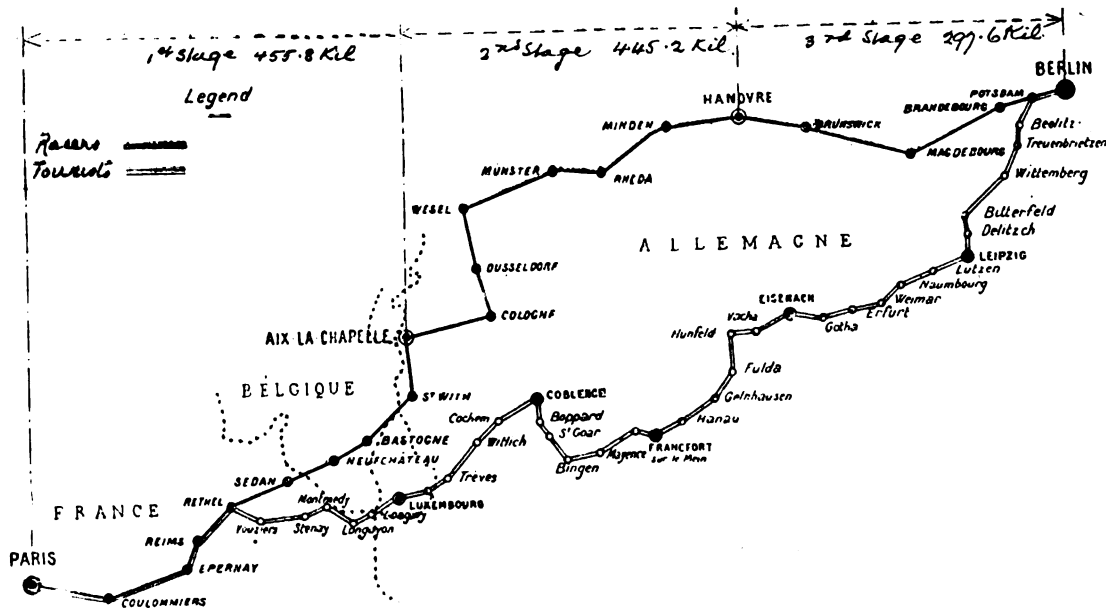

WHEN I alluded to the weight of the Napier car, I said nothing about the weight per horse power, but I showed that high horse power is of no use, if great attention has not been paid to reducing the weight. That my criticism is well founded is clearly demonstrated by Mr. Edge himself, for he claims that the Napier car is as fast as, if not faster than, the best French cars. But if brake horse power per cwt. were the true test of a motor-car's

future the weight of racing cars to about one ton: a judicious limit, taken in connection with a given passenger-carrying space, would in my opinion be very advantageous.

THE German Emperor's prize in the Paris-Berlin race has taken the shape of a silver vase, bearing the inscription "The Emperor William II. to the Winner of the Automobile Race from Paris to Berlin, 27th to 29th June, 1901." The prize money from the different donors will be more than £4,000.

THE Moto-Club of Belgium has petitioned the Brussels authorities to establish a special police force mounted on bicycles in order to control the excessive speed of motor-cars. The authorities, you may be sure, have readily adopted the suggestion, and now everyone is speculating as to how the members of the Moto-Club will like it when they are summoned by the police which their Club has been instrumental in establishing.

MOST of the readers of the *Journal* have seen the "Brocken"—if not in its reality, at least in cardboard and paint, with Mephistopheles and Faust, and the accompaniment of lightning and flames. In neither case does it seem an inviting place for a

ROUTE MAP OF PARIS-BERLIN RACE.

Cliché de

(L'Auto Automobile).

speed, the Napier, with somewhere about 3 h.p. per cwt., should have attained a far greater speed than any of the big cars.

Of course in the untried state in which the car was run it could not have been expected to make a record, but if it had any claim to the proportionate speed calculated from the weight per horse-power it would have shown it for a spell, and passed anything on the road. When I saw it outside Chartres it was certainly going strong, the engine beating up grandly, but I never heard of it passing any other car, whereas the fast cars seem to have gained on it and passed it regularly. Unofficial timing on the road reports its speed between 100 and 110 kilometres an hour, but unofficial timing also reports Fournier as doing as much as 124, and whilst I was waiting for the cars to go by I saw M. Charley return from a trial run on M. Dannat's Mercedes, which did the kilometre in thirty seconds.

THE history of Panhard and Levassor's success is to be read, I believe, in the reduction of weight, and if Mr. Napier will apply his undoubted genius and Mr. Edge his energy towards that end, I think they will stand a chance of bringing home the Cup next year. At any rate, in this case the wish is father to the thought with Automan. I am not the only one to condemn weight, and there is a very sensible proposition on foot to limit in the

run in an automobile. Its difficult heights have, however, been climbed by a party of up-to-date motorists from Vienna, who succeeded in negotiating 18 and 20 per cent. inclines leading up to the summit, which is at an altitude of some 3,600 feet above the sea level.

I WAS invited to visit the other day the works of Messrs. Koch Frères, in Paris, where they assemble their heavy oil carriages, and I was also shown over the works of Messrs. Sautter, Harlé, and Co., where the Koch motor is manufactured. M. Koch himself kindly piloted me, and gave me some interesting details. In his motor there are two pistons acting opposite each other from a single explosion chamber, and although he uses preferably heavy oil—paraffin or kerosene—for reasons of economy, the motor will run with petrol. I even saw it running with alcohol. In the Koch motor-car the motor is carried on a central shaft, on which it would be free to revolve were it not for two spring stays, one at each side of the motor. The object of this ingenious arrangement is to reduce the vibration, which it certainly does to a remarkable extent.

I WAS most interested in a motor-lorry, which I urged M. Koch to send off to Liverpool to Mr. Shrapnell Smith's heavy trials. The lorry, however, was destined for Madagascar, to

which country Messrs. Koch have already sent a car, and there was not time enough to send it to Liverpool. The lorry weighs 30 cwt., and carries from 30 to 40 cwt., at an average speed of from 5 to 5½ miles per hour, climbing hills of 10 per cent. fully loaded at a speed of 2½ miles per hour. The motor is of 10 h.p., and there are three speeds and reverse. The motor consumes about 1½ gallons of heavy oil per hour, or per five miles, and is water-cooled. There is a novel system of water-cooling: the radiator is helical in form, and is contained in a sheet-iron cylinder, at one end of which is fixed a fan in such a manner that the air is drawn through the radiator and the water kept at an even temperature, though the engine may be running whilst the car is standing. Less than half a gallon of lubricating oil is required for a day's journey of fifty to fifty-five miles. Three of these lorries are bound for Madagascar.

PRINCELY prizes keep on appearing in the Paris-Berlin race. Amongst the latest donors are the Grand Duke of Luxembourg and the Grand Duke of Mecklenburg-Schwerin. Although a sufficient number of subscribers did not apply in time for the A.C.F. to engage the special train to follow the race, the A.C.F. are organising special sleeping cars to be attached to the ordinary trains. On Monday and Tuesday, 25th and 26th, the competing cars will be numbered and marked at the headquarters of the A.C.F.

The following is the official route for the Paris-Berlin race, with the approximate distances in miles:—

FIRST STAGE (282 MILES).	
CHAMPIGNY—AIX-LA-CHAPELLE.	
Fort de Champigny (start).	
Fontenay	17 miles.
Epernay	80 "
Reims	97 "
Poix	139 "
Sedan	155 "
Sachy	165 "
Messempré (Customs)	166 "
Longvilly	214 "
Steinmetz	228 "
Büttgenbach	252 "
Montjoie	263 "
Aix-la-Chapelle	282 "

SECOND STAGE (279 MILES).	
AIX-LA-CHAPELLE—HANOVER.	
Aix-la-Chapelle	282 miles.
Cologne	321 "
Düsseldorf	352 "
Duisburg	368 "
Wesel	389 "
Dülmen	423 "
Münster	441 "
Rhedan	475 "
Bielefeld	490 "
Minden	518 "
Gross-Neundorf	542 "
Hanover	559 "

THIRD STAGE (184 MILES).	
HANOVER—BERLIN.	
Hanover	559 miles.
Brunswick	599 "
Erxleben	635 "
Magdeburg	653 "
Jenthin	684 "
Brandenburg	702 "
Potsdam	726 "
Berlin	743 "

MR. JAMES GIBSON has achieved a run which, all things considered, and notably the state of the roads traversed, is worthy of record. Leaving Hebden Bridge, accompanied by Mrs. Gibson, he reached Blackpool, 54 2-5 miles distant, in four hours and twenty minutes, by way of Todmorden, Burnley, Padiham, Whalley, Preston, and Lytham, on his 3½ h.p. De Dion voiturette. Two stops were made *en route*—the first at Lytham to take up Miss Gibson, and the second a mile or two from his destination for petrol. The homeward journey of fifty-six miles was still more successful, being undertaken with three passengers and unmarked by a single stop, the speed working out at exactly 13 11-25 miles per hour.

CORRESPONDENCE.

WET AND DRY BATTERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your last issue that Messrs. Bridgewater and Co. state that out of many thousand sets of Meyra dry cells there have been no complaints. May I state that I have never found a Meyra battery to last, and have discontinued to recommend them. I much prefer accumulators, as, if charged carefully, you at least have a good idea as to how much electricity you have left. I may say I have nothing personally against the Meyra Company, but think that Messrs. Bridgewater's statement is a little exaggerated.—Yours faithfully,

G. H. BECHTEL.

A GOOD RUN ON A MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It may be interesting to your readers who are, or are about to become, interested in motor-bicycles to have particulars of a fine run I had on an Excelsior motor-bicycle last Sunday. I started from Harpenden at 4.15 a.m. and ran to the other side of Royston, 31 miles, in one hour and 45 minutes, stopped ten minutes to oil up, and then ran, *via* Newmarket, to Thetford, arriving at 8.45 a.m. After stopping twenty-five minutes for breakfast, a start was made for Norwich, which was reached at 10.45 a.m. I stopped here twenty-five minutes to examine the machine and see that all was secure and then went on to Yarmouth, arriving there at 12.15 p.m. From Yarmouth I went on to Lowestoft and to Gorleston, where a stop was made for tea, then on to Yarmouth. The latter town was left at 5.45 and a run right through to Newmarket was made, arriving at 9.30 p.m. I left Newmarket for home shortly afterwards, and arrived at 1.20 a.m. after a very enjoyable ride. The total distance by my cyclometer was 274½ miles, the consumption of petrol being seven quarts. The machine and engine caused me no trouble whatever, excepting a few minor details, which were very easily put right. I felt no vibration, and never thought of side slips, which are out of the question on my machine.

This performance, I think you will agree, argues well for the stability and construction of the Excelsior motor-bicycle, which is undoubtedly a grand machine. I intend shortly to run to the Glasgow Exhibition and back on it, and will let you know how I get on.—Yours faithfully,

H. W. LAWRENCE.

YORK TO LONDON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Recently I applied to a railway company for their charge for conveying a motor-car from York to London. As the price asked was £7 10s., I determined to take the car, an 8 h.p. Serpollet, by road myself. Leaving York at 2 a.m., I was in London at 9.30 p.m. the same evening. During the run of 199 miles, not a single bolt or pin gave way, and the total cost of the trip was 21s. 8d. Of this, 17s. 8d. was for fuel, and 4s. for lubricating. After loading up the last time, I ran sixty-four miles without a stop. The run is, I believe, a record for the Gardner-Serpollet in this country. I have been informed that many owners of these cars are giving them up because of the difficulty of finding men to run them. I think that to do so would be a great mistake, and rather than see this done, I shall be pleased to send instructions to anyone who cares to write for them.—Yours truly,

F. HUNT.

COST OF REPAIRS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Reading on page 263 of your valuable *Journal* of June 8th, "Dr. B— P—, of W—, shows that in his case the repairs during a year and three months' use cost only ½d. per mile," I should be interested to know to what type of vehicle he refers, what mileage he covered, and on what tires.—Yours truly,

A. H. NISTER.

EXPERIENCES OF A WATER-COOLED HEAD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am the possessor of a small Renault car, fitted with a 2½ h.p. De Dion engine, and after an experience of twelve months, spent in experimenting in various ways, I have pleasure in giving same to my fellow readers, as I myself have profited considerably through your paper. When I first purchased the car it was fitted with a dry battery and was air cooled. I noticed the engine ran very irregularly, and very often stopped on a moderate hill, especially in warm weather. I was continually adjusting the trembler and electrical parts with very indifferent success. At this time I was induced to purchase a Woven-glass accumulator through reading an article in your paper. Being an

amateur mechanic I possess a small workshop, fitted up with ½ h.p. gas engine, lathe, and dynamo, etc., so could charge the accumulator myself at a very small cost. As soon as charged I put it in the car for a short trial run, and was very much surprised to find the marked improvement in the running, and greater power of the car; but I was still troubled in the hot weather with the heating of the cylinder. I then saw an advertisement respecting the water-cooled heads for De Dion engines, and decided to try one, also one of the water tanks that fit on the back of the car. I fitted the water-cooled head on myself, but the connections for tank I had done by a local tin-smith. On trying the car again I found it slightly improved, but not yet to my satisfaction. From the position of the tank with the water-cooled head I concluded that the circulation was faulty, and this I found to be the case. I had varnished the head, but

on running the car it got so hot that the varnish burnt off; so I decided to have a new tank made to my own design (of copper), and to place it immediately over the engine. After various difficulties and alterations I succeeded in getting perfect water circulation. The tank holds 1½ gallon of water, and is placed directly over the engine, and being in front of the car is considerably cooled by the air coming in contact with it.

I enclose two photographs of the car with the tank in position. You will see it is rather an ornament than otherwise. A brass beading round the tank matches the other parts of the frame. I find it a complete success. During the warm weather the water does not steam until I have been running about twenty miles, and then only after going up a steep hill. There are three speeds to the car, and as I always drive on the fast speed, regulating the pace by the sparking lever and gas lever, it makes very little noise. As regards sparking plugs, I find the new De Dion do all that is required. I have tried Reclus, Hermit, etc., but prefer De Dion. The contacts of most plugs, I find, are too far apart, and I generally place a thin playing card between them rather tightly, which corrects any degree of compression in the cylinder. I also found when I commenced to use accumulators that my difficulties were over in respect to the trembler and contact-breaker. After once being set properly it does not require touching again until something breaks or comes loose. With regard to starting the engine I very rarely have any difficulty, I always make a point of squirting a tablespoonful of paraffin through the compression tap; it loosens the piston rings and cleans the cylinder. In conclusion, I can thoroughly recommend anyone having an air-cooled motor to go in for the water-cooled head, but they should be careful to place the tank where the circulation will be uninterrupted; also I strongly recommend accumulators instead of dry batteries. The latter seem to become tired and exhausted before they are run out.—Yours truly,

GEORGE F. FIRTH.

THE SPRAG DIFFICULTY AGAIN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad if any of your readers can give me some information as to how I can prevent difficulty with my voiturette when it is brought to a standstill upon any steep hill. For instance, on Sunday last I was climbing a remarkably steep hill, and owing to some fault connected, I should think, with the electricity, although the car went up part of the hill on the slow speed gear, the engine stopped. The result was that, although I have a sprag fitted to the back of the car, theoretically to prevent it going backwards, the sprag failed to act. The car jumped the sprag and commenced to go backwards rapidly, and I only saved an accident, which might have been very severe, by turning it into the hedge. Is there any method or apparatus to remedy the serious defect I have mentioned above? If so, I shall be only too pleased to adopt the same on my car.

I believe there has been correspondence previously in your columns with reference to this matter, but, so far, I have never been able to see anything satisfactory mentioned upon this subject.—Yours truly,

FRANK THATCHER.

LIVERPUDLIAN writes:—"I notice in your last issue you mention that a Scotch biscuit firm is experimenting with a motor-lorry. It may interest you to know that Messrs. W. and R. Jacob and Company, Ltd., biscuit manufacturers, of Dublin and Liverpool, have had a motor-lorry in use in Liverpool for some considerable time past."

THE Reading Automobile Club will hold a hill-climbing contest on Wednesday next, the 26th inst. The competing cars will meet at the foot of Peppard Hill, near Reading, at 3.30 p.m. The event will practically be a time contest from a mark across the road on the level to a given mark at the summit of the hill.

HERE AND THERE.

It is said that the national executive of the Social Democratic party of the United States intend to employ a motor-car in an early propaganda campaign.

It is reported that the Westinghouse Electric and Manufacturing Company, of Pittsburg, Pa., have purchased the patents of the Hub Motor Company, Chicago, Ill., whose vehicle was exhibited in London some months ago.

"MOTOR-CYCLES, AND HOW TO MANAGE THEM," by A. J. Wilson, has now attained its fourth edition. Naturally, much contained in the present edition is repetition. On the other hand, Mr. Wilson has brought his subject up-to-date, enlarged it, and added some very clear diagrams. The work is not too technical, and should be invaluable to all who are disposed to take unto themselves that missing link between the bicycle and the motor-car—a motor-cycle. The price of the book is 2s. 6d., and it is published by Messrs. Iliffe, Sons, and Sturney.

SIR JOHN CAMPBELL, BART., of the 2nd Life Guards, has become an ardent motorist. Just previous to the Show he purchased from the British Automobile Commercial Syndicate an 11 h.p. De Dietrich car, which he took to his country seat in the North of England. After having become greatly infatuated with motoring, and through the good behaviour of the car mentioned, he has now purchased from the same company a 24 h.p. Mors, which he is driving all over the country with great success.

WHILST travelling from Bolton Abbey to Bradford, the other day, a motor-car, containing a lady, a gentleman, and two children, failed to make the ascent of Lobwood Hill, and ran backwards. The party narrowly escaped being precipitated into the river below. The vehicle ran against the new fence which protects the roadside, and though the fence was damaged, the car and its occupants were saved when within a foot of the precipice.

A FRENCH contemporary tells the following good story. A Peroune motorist lent his car to a friend, whose knowledge of brakes and carburettors was strictly limited. The friend started off for Cléry, all going well, and intoxicated with success. On arriving at Cléry, where the trip should have finished, a Homeric struggle took place between the amateur *chauffeur* and the brake, which refused to act. So the amateur became a wandering Jew, and journeyed on to Maricourt, where the car stopped for want of petrol. Fearful of trusting himself again to such a mode of transport, the friend found his way home behind a hay motor, and the proprietor had to go in search of his car.

WE hear that a new concern has been formed in Birmingham under the style of the Birmingham Motor Manufacturing and Supply Company, Ltd., which will shortly open up a large dépôt in that city. The new concern, of which Mr. Williamson, late of the International Motor Company, Ltd., will be the managing director, has an ambitious programme, having been organised to exploit both a gear and a belt-driven car of its own manufacture. The promoters will also supply factors, cycle agents, manufacturers, and motor dealers generally, with their new 6 h.p. single cylinder engine, transmission gear, coils, differential axles, coolers, and complete under-carriages. They anticipate a very large trade in this department owing to dealers in the Midlands being able to obtain supplies on the spot, instead of having to send to France. Coachbuilding for motor bodies will also be undertaken. With regard to the cars themselves, these will be known as the "Rex." They will be entirely of British manufacture excepting the electric fittings, and will be put on the market at a reasonable price. The vehicles will be fitted with *tonneau* bodies. In the gear-driven car, transmission will be on the lines of that adopted in the voituresses which lately did so well in the Paris-Bordeaux race. In a week or so, when matters in connection with the new company are further advanced, we hope to be able to publish a full description of the "Rex" cars.

ON Sunday last the members of the Yorkshire Automobile Club held a run to Bolton Abbey and Grassington.

It is reported from Paris that a company is arranging 2,700 dépôts up and down France, where carburetted alcohol, for use in automobiles, will be stocked.

A NEW type of voiturette with the motor in front is, reports *La France Automobile*, in course of construction at the works of Messrs. De Dion and Bouton, at Puteaux.

THE Queen of Holland has become a keen admirer of the motor-car, and is learning to drive one, her brother-in-law, the Duke of Mecklenburg, giving her lessons.

AT the last moment the Prefet of the Pas de Calais forbade the race between Roubaix and Calais which the Automobile Club du Nord had arranged to run off on Sunday last.

MADAME LOCKERT, proprietress of *Le Chauffeur*, is one of the few ladies who will take part in the coming Paris-Berlin race. She, in company with her two daughters, is making the journey on a Richard car in the touring section.

A NONAGENARIAN lady of Spalding recently took a ride in the trailer of a motor-tricycle. She enjoyed it so much that she went again. Although considerably over ninety years of age, the motor has no fears for her—she prefers it to a 'bus.

MESSRS. BOTWOODS, of Ipswich, have sent us a copy of their new catalogue, in which illustrations and particulars are given of the various styles of "Teras" (Gobron-Brillié) cars they have placed on the market.

AMONGST other motor-cars seen on the road to Ascot, and going well, was a Motor Manufacturing 6 h.p. Lynton wagonette, kindly lent by the company to a party of Pressmen. In spite of its ten passengers Coombe and Egham hills were negotiated with ease.

THE Daimler Wagon Company, Ltd., has been registered with a capital of £100 to acquire any licenses, patents, and the like, and to carry on the business of manufacturers of and dealers in all kinds of vehicles (whether worked by animal traction or by steam, oil, electricity, or other mechanical power), etc.

MOTORISTS who contemplate a visit to Hythe must approach the ancient *cinque-port* with due caution. Its Town Council has come to the conclusion that motor-cars are habitually driven at too high a speed through the streets, and have instructed the Town clerk to ascertain the power of the Council to deal with the matter.

THE introduction of motor-cars plying for hire into the city of Oxford has caused an inquiry to be made as to the fee (if any) that had been charged for the licensing of the cars, and whether a sufficient amount could not be levied to recoup the city for the extra amount of street watering necessitated. It was elicited that the motor-cars are licensed as hackney carriages, and subject to the usual fees, which are very small; it was also stated that it was not possible to increase the fees to an amount likely to repay additional cost of watering the streets.

THE other day we had an opportunity of inspecting one of the new Benz delivery lorries illustrated in our issue of February 2nd last. The one we saw at Messrs. Hewetson's dépôt is fitted with a 5 h.p. single-cylinder engine, and is intended for a load of 30 cwt. The vehicle is gear-driven, and is fitted with four speeds ahead and one reverse. It can attain a good speed on ordinary roads, while its hill-climbing powers may be gauged from the fact that, fully loaded, the lorry has negotiated Highgate Hill at a fair rate of speed.

IN placing their new price-list of "Dead Beat" ammeters and voltmeters before the public, Messrs. L. B. and C. W. Atkinson call attention to the considerable economy which can be effected, where electricity is the motive power, by users of their patent instruments. Other advantages claimed are that these appliances are made in England, and with interchangeable parts. As to the ammeters and voltmeters, they are neatly turned out, do not oscillate, and can be clearly read even when travelling. The frictionless movement, attained without the use of delicate jewelled pivots, is, of course, a considerable factor in keeping down prices.

THE STRAKER STEAM VEHICLES.

WITH the extensive growth of heavy steam vehicular traffic—openings for fresh trading concerns are gradually becoming evident. The most recent enterprise is the Straker Steam Vehicle Company, Limited, of 9, Bush Lane, Cannon Street, E.C., who have secured the services of Mr. Sidney Straker, Assoc. Memb. Inst. C.E. and Memb. Inst. Mech. E., as managing director. Mr. Straker's many years of experience in this branch of

FIG. 1.—THE STRAKER STEAM OMNIBUS.

engineering should serve the company in good stead, including, as it does, the production of the first two petrol twenty-six-passenger omnibuses put upon the London streets, which machines, we are informed, have already traversed a distance exceeding 20,000 miles, and the production of the two twenty-six-passenger steam omnibuses sold by him to the British Electric Traction Company, Limited, and now in use in the Potteries, doing 80-mile daily shifts. The new steam lorry, shown in Fig. 2, represents that which in the company's opinion will meet the public requirements, embodying as it does a simple and durable vehicle of great solidity, and constructed consistent with the requirements of common road traction. We are unable at the present time to give full particulars of the constructional details, but many of the salient points which we mention should appeal to users of this class of vehicle. The construction provides for loads up to five tons. The lorry throughout is of the simplest description, such parts that require periodical inspection being made specially accessible. The well-tried system of steam-raising, which embodies the modified De Dion type of steam generator, enables the vehicle to work with a fuel cost not

exceeding, it is stated, $\frac{1}{10}$ d. per ton mile. The power installed exceeds that of the usual practice, thus giving special facilities for hill-climbing and dealing successfully with muddy and sticky roads. A strong device is employed for locking the compensating gear when occasion may demand, and only one attendant is necessary for working and driving the machine. Substantial control arrangements are provided for, a steam superheating system, which is claimed to prevent steam becoming visible when in use, being adopted. Special attention has been paid to the brakes, so that the vehicle may be held on steep inclines under ordinary conditions. The steam raising system renders the machines capable of traversing considerably longer journeys for the same amount of water carried than is usual. The standard frame is made suited for platform areas up to 80 feet. The other vehicle which the company is pushing is of the public service class, Mr. Straker's first machines being the two twenty-six-seated steam omnibuses, as shown in Fig. 1. These machines are now in daily use in the Potteries, being employed as feeders to tramways, with good and economical results, the daily journeys of 80 miles being negotiated to the satisfaction of the users. Since these 'buses were supplied we understand the understructure has been modified, to ensure greater strength and better efficiency.

To offer prizes for improvements in motor-cars is nothing unusual. The Allgemeine Schnauferl Club—in other words the union of German automobile clubs—of Munich, has, however, entered a new and original field. Three silver cups have been offered for the three best automobile songs, humorous or of a serious nature, which fit well-known melodies.

THE Locomobile Company of America claim to have the largest and most complete factory in the world for the manufacture of automobiles. The main building of the factory at Bridgeport comprises 125,000 sq. ft. of floor space, this not including three other large parts of the plant. That the claim is not unfounded will be seen from the fact that so far no less than 3,000 complete machines have been turned out.

GRANTED that France is, as is frequently stated, the cradle of the motor-car, any work dealing with such must be taken seriously. The value of the latest of these, *Les Automobiles Electriques*, by M. Gaston Sencier and M. A. Delasalle, has been fully appreciated in France, where it has won a silver medal from the Automobile Club of that country. The work, which contains some 400 pages and is well illustrated, is published by M. Ch.

FIG. 2.—THE STRAKER STEAM LORRY.

Durand, of 49, Quai des Grandes-Augustins, Paris, at 15 francs. It commences with one, Thomas Davenport, an American, who, in 1834, experimented with a magneto-electric car, which travelled without rails. From that point we are carried easily and pleasantly to the most up-to-date type of car now running. Numerous diagrams and tables possess the advantage of clearness in a marked degree.

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs.

THE BIG EVENT OF 1901.

THE following vehicles have been definitely entered during the past week for the Automobile Club Trials in connection with the Glasgow Exhibition:—

- Two vehicles by the Auto-Carriage Company.
- Two vehicles by Humber, Limited.
- One vehicle by the Locomobile Company of America.
- One vehicle by Panhard and Levassor.
- One vehicle by Messrs. W. T. and S. E. Botwoods.
- One vehicle by the Lanchester Engine Company.
- One vehicle by the Eagle Engineering and Motor Company, Limited.
- One vehicle by the Progress Cycle Company.
- One set of tires by the Dunlop Tyre Company.
- Private owners' section:—
- Two vehicles by Mr. J. Holder.
- One vehicle by Hon. C. S. Rolls.
- One vehicle by Mr. R. E. Phillips.

BRITISH MOTOR TRACTION COMPANY, LTD., v. SMITH.

In the Chancery Division, last week, before Mr. Justice Kekewich, this case came on in the form of a short cause on motion for judgment in default of appearance. The action was originally brought for the purpose of restraining the defendant from infringing the Maybach patent for carburettors. His lordship now gave judgment for the plaintiffs in accordance with minutes which had been prepared and which provided for an injunction, an inquiry as to damages, the delivery up of the infringing articles, and costs as between solicitor and client.

THE MOTOR TRACTION COMPANY, LIMITED.

THE report of the directors of the Motor Traction Company, Limited, for the half-year ended 31st December last states that during the period the attention of the board has been almost entirely occupied with rebuilding the factory and depot at Walnut Tree Walk. The two omnibuses which for a considerable time were running between Kennington and Oxford Circus were withdrawn in December last, the directors having come to the conclusion that all the experience that could be got from the working of these vehicles had been gained. The improved omnibuses ordered from the Daimler Company of Cannstatt were expected to be delivered in March, but, owing to certain alterations deemed necessary, some delay has occurred; delivery, however, is promised in a few weeks. In the early part of the present year the factory buildings were so far completed as to admit of work being commenced in a portion of the premises. The additional machinery required is being put down as quickly as possible, and the company will soon be in a position to undertake the construction of motor-vehicles of the most approved type. A large space being available for storage purposes at the depot, the company is now prepared to house, repair and keep in order any description of motor-car, and has special facilities for charging electric cars and for the sale of petrol spirit.

THE DUNLOP COMPANY, LTD., v. BRITISH AND COLONIAL MOTOR-CAR COMPANY, LTD.

In the King's Bench Division, on the 14th inst., the Dunlop Pneumatic Tyre Company, Ltd., and the Pneumatic Tyre Company, Ltd., of Dublin, sued the British and Colonial Motor-Car Company, Ltd., for damages and infringement of the Bartlett patent improvements in tires. The plaintiff's case was that the defendants, who were exhibiting half-a-dozen motor-cars at the cycle exhibition at the Agricultural Hall, London, in November last, had tires upon the cars which were of foreign manufacture, and an infringement of the Bartlett patent. The defendants denied the infringement. Mr. Walter appeared for the plaintiffs; Mr. T. Terrell, K.C., and Mr. Statham for the defendants. Mr. Walter, having stated the facts and called a witness who proved that the tires upon the defendants' cars were an infringement of the Bartlett patent, stated that at the eleventh hour the defendants had admitted that the tires were an infringement. Mr. Terrell submitted that though technically there was an infringement yet in reality there was no infringement because the tires were only used for the cars to stand on, and were not for sale. There was no intention to sell them, and no intention whatever to commit any infringement. Therefore he submitted that that was not a case for an injunction. He called Frank D. Hackney, secretary to the plaintiff company, who stated that the cars came from Liège, and were usually sent without tires, and the defendants had them fitted themselves with Grappler tires, but on this occasion the manufacturers had, without orders, fitted the cars with German-made tires, which were an infringement of the plaintiff's patent, but the tires were not for sale, and there was a notice up to that effect. In cross-examination witness admitted that the notice was not put up till after the service of the writ, which occurred very promptly, whilst the show was still running. His Lordship held that there had decidedly been an infringement, but the damages were obviously only nominal. Therefore there would be judgment for the plaintiff for 40s. damages, and for an injunction, the defendants giving an undertaking that the German-made tires should be returned to Germany.

In a second action by the same plaintiffs against Mr. M. de Breynne the circumstances were similar, and judgment for 40s. damages and an injunction was also given against the defendant.

FURIOUS DRIVING CASES.

At Bow Street, Mr. D. M. Weigel, of Long Acre, W.C., was summoned for driving a motor-car to the common danger. P.S. 33E stated that on Bank Holiday morning the defendant drove a motor-car in Long Acre at the rate of twelve or fourteen miles an hour. Near James Street four or five people were crossing, and they had to run to get out of the way. The defendant said the motor-car was an old one. It was only geared to nine miles, and it was a mechanical impossibility for it to go faster. After hearing further evidence the Magistrate came to the conclusion that the defendant was not driving at a dangerous pace, and dismissed the summons.

At Belper, Harry Butler, an electrical engineer, of Derby, was charged with furiously riding a motor-cycle, at Belper, on June 1st. Police-Inspector James stated defendant rode at nineteen miles an hour in one part of the town, and in another the speed was twenty-six miles. Several officers had measured distances and set their watches to seconds. The time was taken by three officers. Superintendent Vardy said the defendant could not be caught, and his reckless riding had frequently attracted attention. A fine of £2 and 16s. costs was imposed.

At Huntingdon Division Petty Sessions, Henry J. Windhurst and Frank Dennis were summoned for riding in a motor-car and driving the same at a greater speed than twelve miles an hour, contrary to the regulations of the Local Government Board, at Bampton, on May 14th. Mr. Spencer appeared for Windhurst. The case against Dennis was dismissed and the other defendant was fined £5 and costs.

At Slough, Mrs. Grace Ansell, of Sloane Street, London, was fined £5 including costs for driving a motor-car to the common danger at Colnbrook. Constable Young deposed that the car knocked down a man. Defendant said the car was reduced in speed at the time, and if the man had not caught hold of the splash board it would have cleared him. Although he was unhurt, he had been compensated.

At Epping, Mr. Harold H. Baring, of Wallsgrove House, High Beech, was fined £10 and costs for driving a motor-car at a greater speed than twelve miles per hour. A constable said that the car went by like an express train at a rate of between thirty and forty miles an hour, and another witness likened its speed to "a flash of lightning."

At Westmoreland County Petty Sessions, Christopher H. Oliverson, motor-car manufacturer, Kendal, was charged with driving a motor-tricycle at a greater speed than was reasonable on the highway at Sizergh on May 31st. Mr. R. F. Chorley appeared for the defendant, who pleaded not guilty.—P.C. Balmer stated that at 9.20 p.m. on the night of the 31st ult., he saw the defendant driving a motor-tricycle towards Milnthorpe. Witness took his watch out of his pocket and timed the defendant between five telegraph posts. He afterwards measured the distance between the posts and found it to be 265 yards, which defendant accomplished in twenty seconds, therefore his pace must have been 27 miles 180 yards an hour. Witness requested him to stop, but he took no notice of the request. Mr. Chorley submitted that the constable had made a mistake in his timing. How could he tell when the defendant had reached the fifth telegraph post, when he was 265 yards away? Defendant's wife was on a bicycle attached to the motor-tricycle, and it was not likely that a gentleman would jeopardise the safety of his wife by going at such a speed as had been stated. The defendant was then called, and stated that it was his custom to slacken speed in going down hills, and on this occasion he would perhaps be going at a rate of twelve or fourteen miles an hour. He was not going at twenty-seven miles an hour. He met no traffic of any kind until he passed Levens. In reply to Superintendent Graham defendant said he had been warned about going fast, but that was only through the town. The magistrates inflicted a fine of £1, and 17s. costs.

At Selkirk, Michael M'Pake, motor-car driver, of Galashiels, was charged with driving a motor-car on the Yarrow Road at a greater speed than ten miles an hour. Thomas Milne, police-constable, deposed that on the day in question he saw a motor-car cross the Bridge at Tibbie Shiels and pass the nineteenth milestone. He looked at his watch at that time, and he also looked at it when the car passed the seventeenth milestone. It had taken exactly ten minutes to cover the two miles. He mounted his bicycle and followed the car till it reached the fourteenth milestone at Craig-Douglas Burn. It took exactly nine minutes to do the three miles, or nineteen minutes to the five miles, being at the rate of fully fifteen miles an hour. The car was driven by accused, and was filled with passengers. Witness also stated that he had been sent there on purpose to watch the car, and prior to the time it left Tibbie Shiels, he and Constable Brownlie had adjusted their watches and put them at the same moment. Alexander Brownlie, police-constable, Cappercleuch, corroborated in all details, and added that he was in plain clothes, but Constable Milne was in uniform. For the defence, M'Pake was the only witness examined. He stated that on the day in question he drove the motor-car from Galashiels to Tibbie Shiels and back. He had ten passengers, he himself making eleven on board. He could drive the car at four different speeds, the highest with eleven passengers being twelve miles an hour on level road. The Fiscal shortly reviewed the evidence, and submitted that he had abundantly established his case. Mr. Lees, for the defendant, contended that a prosecution in this case was not warranted. The constables, he said, were evidently set there for the purpose. The Sheriff said the question he had to consider was the simple one of whether the accused was driving

quicker than ten miles an hour, and it was clearly proven that there was an excess of speed of at least five miles an hour. He had no other alternative but to find the case proved. He believed it was the first prosecution of the kind, certainly in that county, if not in Scotland. He took that into account, and also the nature of the road, and he would inflict a nominal penalty and fine accused 2s. 6d., with the alternative of three days' imprisonment.

At Walsall, Harry Chambers, of Sutton Coldfield, was charged with furiously driving a motor-tricycle, in Lichfield Street, on the 10th inst. Police-constable Thomas stated that the defendant rode at an enormous speed—about 14 miles an hour witness estimated it at. The policeman, in reply to the Bench, admitted that there were no persons or vehicles immediately in front of defendant, and the latter said he hoped the Magistrates would not put the speed limit too low, as by so doing they would hamper the best industry in England at the present time. The case was dismissed.

At the Bournemouth Borough Police Court several charges against drivers of motor-cars for furious driving were heard. George Budden was summoned for driving his car at a speed which was not reasonable and safe, having regard to the traffic. Sergeant Littlewood said that on the afternoon of Tuesday, the 11th inst., he was on duty in Old Christchurch Road, with Inspector White, standing near Holy Trinity Church. Police-constable Baugh was outside Swaffield's Nursery, exactly 220 yards away. He signalled them that a motor-car driven by defendant was passing him, and he (witness) took the time by a chronometer, and defendant covered the distance of 220 yards in 34 seconds, which was at the rate of 13 miles 414 yards per hour. Inspector White corroborated. Defendant said he knew he was being watched, and slowed down as much as possible; if he had gone slower he would have impeded the traffic behind. Questioned by Alderman Mattocks, the Sergeant said he did not make any signal to intimate that he had timed the defendant. Fined 2s. and 8s. costs. A case against Sidney Millett was next heard. Sergeant Littlewood said this defendant covered the same measured distance in 32½ seconds—13 miles 1,489 yards an hour. Defendant had twice before been convicted of a like offence, and was now fined £1, including costs. James Way was stated by Sergeant Littlewood to have covered the measured distance of 220 yards in 34 25th seconds—just over 13 miles an hour. Fined 2s. and 7s. costs. Louis McCullagh, according to the sergeant, covered the distance in 34 seconds. Defendant said he was only going at the rate of between 5 and 6 miles an hour, for he put on both the foot and hand brakes. Fined 6s. and 9s. costs, there being a previous conviction. Percy Stevens, another offender, was fined 2s. and 7s. costs.

OBSTRUCTION CASES.

At the Oxford City Court William G. S. Hynde, Abingdon, was summoned for causing an obstruction in St. Michael's Street by means of a motor-car, on the 4th inst. He pleaded not guilty. P.C. Steele stated that the car was standing outside the Union premises from 6.50 till 8.50. The Mayor said the Bench considered there had been an obstruction, and would impose a fine of 1s. and 7s. costs.

At Southampton, William Duncombe, of Broughton, was summoned for having, on June 1st, caused an obstruction in Above Bar Street by leaving a motor-car there. The police evidence was that the car was standing in the street for an hour, whilst the defendant was in a public-house. Defendant admitted the fact that the car was standing in the street during the time mentioned, but denied that there was any actual obstruction of the traffic. A fine of 2s. 6d. and costs was imposed.

A NON-STOPPING CASE.

At the Wimborne County Court, Judge Philbrick, K.C., had before him a case in which Fleetwood Bond, of West Parley House, sued Alexander Howlett, of Boscobee, for £12 for damage suffered by the negligent driving of the defendant of a motor-cycle on April 3rd on the Ringwood Road, Longham. Plaintiff stated that whilst out driving with his wife and sister in a Stanhope phaeton, and when in the Ringwood Road at Longham, he saw a motor-cycle, on which were defendant and his wife, coming towards the carriage. Fearing his horse would shie, he held up the whip as a signal to defendant that he wished him to stop. The injunction, however, was not obeyed, and the motor, which was on the wrong side of the road, apparently was coming straight for the horse, when within about ten or twelve yards of it it suddenly swerved. This frightened the animal, which, plunging, overturned the phaeton, and threw plaintiff, his wife, and sister out. Neither, fortunately, were seriously injured, although the carriage and harness were damaged. P.C. Shepherd said in consequence of being fetched by Mr. Bond he went to the scene of the accident and questioned Howlett, remarking, "It's a great pity you did not stop when Mr. Bond put up his whip," and defendant replied, "If I were to stop for every person that put up his whip I should be stopping every few minutes." Mr. Curtis, having addressed his Honour, called the defendant, who, declared that upon observing the trap approaching he switched off the electricity, with the result that the pace slowed down to about six miles an hour, and when within about forty yards of the horse, swerved across the road, giving the trap practically all the road. Plaintiff made no signal whatever with the whip but simply whipped the horse. As witness passed, the animal shied and went into the hedge. There was no truth in the suggestion that he was coming along at fifteen to sixteen miles an hour. Lavinia Howlett, the wife of the defendant, said she was riding on the front seat of the cycle

and saw the carriage coming, but observed no signal; the only thing she saw was Mr. Bond whip the horse. Another witness also stated that he did not see the plaintiff signal. His Honour, in giving a verdict for the plaintiff for the sum claimed, relied on the evidence of the police-constable in respect to the admission made to him by defendant.

A CASE OF ASSAULT.

At West London Police Court last week, Cecil Edge appeared before Mr. Rose to answer two summonses for assaulting Charlotte Clarke and her little boy Albert Clarke. Mr. Schiller, barrister, defended. The mother's complaint was that on the evening of May 22nd she peeled an orange for her little boy, and afterwards saw him chased by the defendant, who shook him violently and slapped him on the side of the face. When she pulled the child away the defendant turned round and slapped her face. The defendant was with a motor-car, and complained that her child had thrown orange peel at him. Police-constable 158 F gave evidence on behalf of the complainant, and stated that he saw the distinct print of a man's hand on the faces of the mother and her boy. The defendant in his evidence positively denied slapping the mother's face. He said that while driving a motor-car the boy threw part of an orange, not peel, striking him in the eye. He stopped and chased the boy. While talking to him the mother came up and struck him, cutting his lip. All he did was to raise his arm to ward off the blows. Mr. Schiller having pointed out the danger caused by street boys throwing missiles at the drivers of motor-cars, the defendant was fined 20s. with 2s. costs in the case of the mother, and the costs only in the other, the magistrate stating that he was wrong in chastising the boy.

The Begbie Manufacturing Company of Cumberland Park, Willesden Junction, W., have secured the agency for Aster motors in the United Kingdom.

A FRENCH writer remarks that the motor-bicycle looks like becoming very popular this summer. The big towns of Amiens and Lille are regular hives of motor-cycledom.

The Austrian State Railway authorities have placed an order with the Austrian Daimler Motor Company of Neustadt, Vienna, for a 32-seated third class motor-vehicle to run on rails. The car will be propelled by a 4-cylinder Daimler motor of 30 h.p. and will be arranged to run in either direction. It is intended for use on the Lower Austrian South-Western Railway, and will be ready by the autumn.

The Continental Caoutchouc and Guttapercha Company inform us that during the race Paris-Berlin they are establishing dépôts at the following places: Sedan, Aix-la-Chapelle, Munster, Hanover, and Magdeburg. Tires and inner tubes, in all sizes with which competing cars have been fitted, will be stocked there for the convenience of any automobilist taking part in the race, and there will also be at each dépôt two or three mechanics, who will be at the disposal of those who need their services.

In January of this year Mr. J. W. S. Langerman, of New York, imported from France two Panhard cars, which were seized by the Customs officials on the ground that the statements made to the inspectors at the time of the importation were not correct. Mr. Langerman presented invoices which purported to show that the vehicles had been in use more than a year. The Treasury officials, however, communicated with special agents in Paris, and it was learned that the cars were almost new. Collector Bidwell then assessed Mr. Langerman 2,677 dollars for duties. He refused to pay, and notified the U.S. Treasury Department of his intention to fight the case to the end. Mr. Langerman has changed his mind and has agreed to pay the duties levied, and in addition a penalty of 1,000 dollars, which makes the total fees collected 3,677 dollars (£735).

The Thornycroft Steam Wagon Company of America, of Paterson, N.J., have in course of construction ten of their 4-ton steam wagons. The first of these has been purchased by the Newark Licorice Company, Newark, N.J., who operate a number of heavy horse trucks, and who tested the steam truck in their regular service and proved to their satisfaction that the wagon could make eight trips daily instead of the six trips made by the horse trucks. As the former hauled three tons each trip, while the latter hauled only two tons, the daily hauling capacity of the steam wagon is exactly double that of one of the present horse trucks. The Thornycroft Company are also building a special steam truck of five tons capacity for the Merrimac Chemical Company, of Boston, Mass. This truck is to be used in hauling heavy carboys of chemicals, and will have a special body with a metal lining.

THE Motor-Car Journal.

COMMENTS.

IT appears to be probable that Big Event will be held under the auspices of the Glasgow International Exhibition, and will be called the "Glasgow International Exhibition Trials of the reliability of motor-vehicles organised by the A.C.G.B.I., with the co-operation of the Scottish Automobile Club affiliated with the A.C.G.B. I., and under the supervision of the Sports Committee of the Glasgow International Exhibition." It is hoped that the Council of the Glasgow Exhibition will give a gold and silver medal for the two most successful vehicles in each of the classes in Section 1 (Manufacturers and Agents) and a bronze medal for the successful vehicle in Section 2 (Private Owners' section). It is further suggested that on the day after the conclusion of the trials, viz., Saturday, the 7th September, an automobile race meeting should be held on the track in the athletic grounds of the Exhibition. The Exhibition Council will offer prizes amounting to £150 for automobile events on this occasion. Thirty-eight vehicles have already been entered in the Manufacturers and Agents' section, five in the Private Owners' section, and the Dunlop Tire Company have entered a set of tires in Section 3. We are requested by the Committee of the Automobile Club to state that the entry fees at present are: Section 1 (Manufacturers and Agents), £25 per vehicle; Section 2 (Private Owners), £10 per vehicle; but that after noon on Monday, the 1st July, the entry fees will be raised to £30 and £15 per vehicle respectively.

The Demonstration at Leicester.

WE learn that one hundred and ninety County Surveyors and Engineers have accepted the invitation to drive on motor-vehicles to various points of interest around Leicester to-day (Saturday), on the occasion of the meeting of the Incorporated Association of Municipal and County Engineers. It is hoped that all members of the Automobile Club who own motor-vehicles will make a point of driving or sending them to Leicester on the occasion of the Conference, so that full advantage may be taken of the opportunity afforded another large body of obtaining a practical insight into automobile control. All cars should be at the Town Hall, Leicester, at 8.45 a.m. to-day (Saturday).

A Weight Limit.

THE proposal to limit racing cars in future to a weight of 1,000 kilos is naturally calling forth a great deal of criticism in France. That well-known authority on all that appertains to a motor-car, M. Paul Meyan, has devoted some space to the consideration of the reform in a recent number of *La France Automobile*. After calling attention to the fact that many cars built for racing are over-engined, he urges that a motor developing 14 h.p. in a car that

does not turn the scale at 400 kilos is as unpractical as the monster of nearly two tons. Lightness, solidity, and comfort must be the essentials of the future motor-car rather than speed gained by the sacrifice of all else. A 20 h.p. car capable of running 600 kilometres without stopping, with four passengers up, at a speed of fifty to sixty kilometres per hour, and weighing 800 to 900 kilos, is what M. Meyan would like to see. But if a limit of weight is to be compulsory in future motor-car Derbys, why not a limit of horse-power too? Let the one be proportionate to the other, then will construction be the winning factor.

The Surrey Police.

AT a recent meeting of the Standing Committee of the Automobile Club, some correspondence with Captain Sant, Chief Constable for Surrey, was submitted. In it Captain Sant expressed the opinion that the driver of a motor-vehicle must stop if called upon to do so by a police constable, whether the constable be in uniform or not. It was directed that Captain Sant should be informed that the Committee regret they cannot see their way to interfere, except in cases in which a motor driver has failed to stop when called upon by a person in charge of a restive horse or by a constable in uniform. The Committee feel that they would not be acting justly to automobilists by assisting in prosecutions for failing to stop when called upon to do so by a person in plain clothes.

Illumination.

EVERY improvement in illuminating apparatus is eagerly taken up by the nocturnal motorist, and the modern acetylene lamp, especially the latest Blériot, with its lens cut in prismatic rings, similar to the refractors in use for lighthouses, is most alarming in its glare, which, though an indispensable safeguard to the driver (for we shudder now at the recollection of our early post-Act peregrinations by the light of two dim candle-lamps, varied by an occasional excursion into the ditch), is apt to make the enemy, seated behind a benighted hay-motor, blaspheme. An idea to remedy this inconvenience to other users of the road was shown us recently, the inventor of which finds it occasionally useful, without being detrimental to the natural use of the lamp. It consists of a small shutter worked from the seat, temporarily obscuring the headlight, wholly or partially as may be required, and should prove convenient when passing through towns or streets on an evening drive.

Progress.

CONVERSIONS, not merely in the ranks of County Councillors, are proceeding apace, and the friends who said last year that they meant to "wait till motor-cars were more reliable" are now, the wiser of them at least, getting cars. Well, they are more reliable, perhaps, than last year, or, at least, than four years ago. But it is hardly realised that the particular accessory of an automobile that has chiefly increased in reliability is that important one the driver. Ninety per cent. of the troubles that beset

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

the beginner are avoidable or curable by superior knowledge and foresight; and of the remaining 10 per cent., 9 are punctures. Information—in print or otherwise—and assistance are far more accessible than they were, and the path of the tiro has been greatly smoothed thereby. Three years ago we met a tricyclist *en panne* at a large seaside town, and investigation showed that a cycle agent had replenished his tank with paraffin. Such a thing can hardly happen now, where the mystic sign "petrol" or "Pratt's" meets our view at the doors of not only cycle agents, but of "pubs" sometimes, and, in one case we noticed, of a village purveyor of tobacco and lollipops. In the old days of the "Otto" bicycle, its makers would not sell unless the purchaser undertook to have a course of instruction from them. It is hardly to be expected that such a wise ordinance will be followed now unless made compulsory, but the "convert" will do well to take example thereby, and spend some pains in acquiring that knowledge which, in nothing more than automobilism, brings its own reward.

Motor-cars at Hastings.

for motor-cars to ply for hire in the borough, and that the

THE Hastings Town Council has adopted a resolution "That it is advisable that the number of licences for vehicles of the omnibus, wagonette, and char-à-banc classes be forthwith increased, with a view of additional licences being issued

TWO SNAPSHOTS OF BARON HENRI DE ROTHSCHILD'S "MERCEDES" CAR.

Licensing Committee be authorised to issue such additional licences as they may think fit." Councillor Boutwood said that since the Council instructed the Licensing Committee to restrict the number of licences for motor-cars, very considerable improvements had taken place in the motors, and the Council had had experience. There had, during the two years, been no complaint, either on the part of the public or on the part of the police, as to the speed, and no inconvenience had been experienced by the other traffic. On the other hand, the cars seemed to be greatly appreciated by the public.

Accessories to Crime.

NOT content with having seen the automobile at the theatre door and at the church gate, the *Referee* wants to see it figure prominently at Newgate ere the famous prison house is razed to the ground. Our genial contemporary revives memories of the Yarmouth murder, and details how the difficulties of the police could have been increased had Bennett had a motor-car at his command. "He could have committed his crime at the time he did," says the *Referee*, "and have been in bed at his lodgings before eight on the Sunday morning." After such a suggestion the police will probably make inquiries of motor-car dealers when searching for those who flee from the fear of the law.

The Mercedes Car.

WHAT a truly wonderful car the Mercedes is! Here are a couple of photographs of the one owned by Baron Henri de Rothschild, and which appears but little bigger than a 12 h.p. Panhard, so compact is it. It might well serve as an object lesson to English constructors, who do not seem to economise space so well as do French and German manufacturers. The difference in size between the 70 h.p. Napier and other cars competing in the Paris-Bordeaux race was considered by many to be out of all proportion to the advantage possessed by the English vehicle in the matter of horse power.

Motor-Cars and Hill Traffic.

EVERYONE is familiar with the sight of a sorry-looking horse being brought to the assistance of omnibuses and other vehicles seeking to reach the top of stiff elevations. Often do these animals present a very pathetic picture, and frequently is their help of a doubtful nature. The trying gradient at Holland Park Avenue, W., is a case in point. There an extra horse is provided for omnibuses, but the animals drawing other vehicles have no such assistance, and a local gentleman asks whether motor-cars could not be used to give assistance to uphill traffic. The idea is useful as indicating that the automobile is no enemy of the horse, but rather his friend. There is, however, a better way of helping jaded steeds, and that is to do all haulage

of heavy loads up hills by motor-vehicles. There will the horse become the friend and playmate of man instead of being forced to drag out an existence as a beast of burden.

The Steam Engines and Boilers Bill.

THE Select Committee of the House of Commons appointed to inquire into the Steam Engines and Boilers (Persons in Charge) Bill sat on the 21st inst., presided over by Mr. Renshaw. Mr. Edward G. Hiller, chief engineer and manager of the National Boiler and General Insurance Company, Limited, Manchester, was called, and in the course of his examination Sir Thomas Wrightson asked: What is your opinion on the motor-car question? Is there any necessity to have a skilled attendant? Witness: I should think not, or cars would probably come under the Bill in many cases. I think steam motor-cars would come under the Bill. Mr. Jacoby said there was a clear and distinct pledge given in the House that mercantile marine or motor-cars were to be excluded from the Bill. The Chairman, after consultation, however, announced that the question raised in regard to motor-cars was open to be discussed. In answer to Mr. Allan, witness said he was anxious that the attendants of boilers should be as good and as efficient as possible, but he had not been able to find boiler explosions due to lack of technical knowledge, and, that being the case, he did not see what object could be gained by giving certificates. The Committee then adjourned.

Petrol v. Electric Cars.

It is to be regretted that some of the electrical papers should have gone out of their way to disparage petrol cars while extolling those in which the motive power is electricity. Surely there is room for both types to be subjected to fair and widely scattered tests. Sneering at petrol cars as "clattering monsters ridden by individuals with masks, peaked caps, and mackintosh garments," is not the way to popularise the automobile; nor will it further the general interests of the industry. Certainly something better might be expected from those journals that constantly criticise "ignorant litterateurs who scrawl copy for the provincial papers." When a majority of people have been converted to the mechanical vehicle on ordinary roads will be the time to denounce unseemly cars. But the question will be settled without the help of vapid paragraphs, for in this, as in other things, the rule of "the survival of the fittest" will operate to the best advantage of the public.

Motor-Cars for Portugal.

THE motor-car is practically unknown at present in Portugal, the wretchedly paved streets in all the towns being much against their immediate general progress. In fact, a car occasionally driven by Prince Dom Alfonso and one or two motor-tricycles are the only representatives of the automobile with which the public are familiar. Some time ago a few inferior French cars were about, but they have apparently disappeared, leaving only a bad impression behind them. The district around Lisbon is very hilly, and a local correspondent who is familiar with the whole country suggests to us that cars intended for Portugal should be built with, say, a two mile speed and extra strong driving gear and road wheels. This latter point is very important. The most saleable car would be one suitable for the week-end family trip to seat two adults and two children. It should have a collapsible hood for protection from rain and sun, and the machinery should be enclosed and well protected from dust and mud. With a minimum speed of two miles and a maximum of 16 to 18 miles an hour, a car fitted with reverse would be saleable in Portugal at about £200. The rough streets paved with 6 in. irregular cobbles will detract from the advance of the run-about car in Lisbon itself. Beyond the five-mile radius the roads are tolerably good but very dusty in the summer; the hills are anything up to quarter mile long and 1 in 6 incline. With regard to motive power electricity can only be obtained within the boundaries of Lisbon, and paraffin, which is obtainable everywhere, is nearly as expensive as petrol.

Butterfly Tactics.

THE other night we went to a conversazione of the Institution of Electrical Engineers, and, whilst talking to an eminent scientist, learnt with regret that, though he regarded motoring as an absolute necessity, he hated motorists as a class. His reason was personal, and not without cause. It seems that the scientist dwells in a thoroughfare, within the four-mile radius, which is celebrated for the excellence of its wood-paving. All night long, from 11 p.m. till 5 a.m., this particular stretch is alive with motorists, who practically prevent sleep. All light sleepers will appreciate this genuine grievance. It was just such inconsiderate conduct that earned for the early cyclist the contemptuous title of "butterfly." Let us hope that the "fire-fly" will not follow in his track, and win a similar unenviable reputation.

What a Horse does to a Road.

THAT a horse's hoofs can remove twenty-four pounds of road surface in one mile seems incredible; but facts are stubborn arguments, and in proof of this statement Mr. Louis Derr, an instructor of the Massachusetts Institute of Technology, brings forth his facts. Mr. Derr, who is interested in the road question from a motorist's point of view, one day noticed that a horse, trotting past him, and drawing a light rubber-tired

carriage, cut out a tiny pile of the surface material of the road at every step. From curiosity, Mr. Derr determined on an experiment. He took an envelope and fine brush, and collected the material loosened by two hoof beats on a certain street; later he did the same on one of the boulevards, and also on one of the macadamed streets. This gave him material from six hoof beats in all, and its weight was .0366 pounds, or .0061 pounds for each hoof beat. He calculated that a horse takes about 1,000 steps per mile for each foot, therefore it makes 4,000 hoof beats and digs twenty-four pounds of surface from the road. It really is surprising what a lot the motorist is beginning to teach mankind about the horses which he has been riding and driving ever since the flood.

Military Occupation.

OUR neighbours on the Continent are largely indebted to tactical considerations for their excellent roads, but the results of military occupation of our own country lanes are too often deplorable, and in default of any War Office responsibility for damage caused by heavy traffic, pressure should be brought to bear on local authorities to enforce the keeping of their roads in a fit state to bear such calls upon them. The pretty alternative route from Liphook to Petersfield, *via* Liss, skirting Woolmer Forest, which used to have a fair surface, is now, as we found when driving along it recently, in a fearfully rough state, and almost impassable except at a crawling pace, owing to the deep ruts and holes in it. The cause is evidently the heavy military traffic it has to carry, for which it receives no more attention than formerly, when little traffic passed that way.

M. L. RENAULT ON HIS PARIS-BORDEAUX CAR.

A Tour to Portsmouth.

It will be remembered that at the dinner held in connection with the run in November last to Southsea, Mr. A. L. Emanuel, the Mayor of Portsmouth, gave an invitation to the Automobile Club to visit Portsmouth this summer. Mr. Emanuel suggested on that occasion that the cars should leave London and arrive at Portsmouth, and that a cup should be given for cleanliness on arrival, or whatever else the Committee might decide upon. That on the next day should be held a floral decoration procession for a ten-guinea cup, which he would present. Mr. Emanuel also referred to a second five-guinea cup offered by a member of the Club, Mr. Henry Edmunds, the entrance fees to go towards the local hospital, which is in great need of funds, and which he, the Mayor, was desirous of doing his utmost for during his year of office. We now learn that it has been arranged to hold this run on Friday and Saturday, July 26th and 27th. Members of the Automobile Club who intend to take part in this tour are requested to communicate with the Secretary without delay. It is probable

that other prizes will be offered in addition to those referred to by Mr. Emanuel.

Another Public Service in Lincolnshire.

A PUBLIC meeting was held at Spilsby last week, to consider the desirability of forming a local motor-car company. In consequence of the short notice given, there was not a large attendance, but those present displayed great interest in the matter. Ways and means were fully discussed, and a fair amount of the required capital was promised. It was finally resolved that a company be formed for the purpose of running a service of cars between Spilsby and neighbouring towns, etc., and to ply for hire in Skegness. The company will be known as the Spilsby Motor-Car Company, Ltd., and the capital will be £500, in £1 shares.

The Municipal Motor-Omnibuses of Southampton.

At the last meeting of the Southampton Town Council, the Tramways Committee reported that the Daimler Motor Company, Ltd., had written referring to the order for three vehicles, stating that, as the result of some trials they had just made with similar public service vehicles, they were quite convinced that for ease and steadiness of running, absence of vibration, etc., there was no comparison between their four-cylinder motor developing about 18 b.h.p. and the two-cylinder motor developing about 11 b.h.p., which they had arranged to fit in the Southampton cars. They felt so strongly on the point that, if the Corporation would slightly extend the period of delivering the vehicles, so as to give the time necessary to making the alterations—say three or four weeks—they would be prepared to give them a four-cylinder engine developing more than double the h.p. they had contracted to supply them with, and to fit these extra-powerful motors into the omnibuses at an additional cost of only £50 per vehicle. The Tramways Committee recommended the adoption of the offer, and that application be made to the Finance Committee with respect to the increased expenditure of £50 per vehicle.

The Latest in Masks.

At last, according to the *Daily Telegraph*, a becoming substitute has been invented for the inartistic masks that usually disfigure the face of the automobilist. A Paris sculptor proposes to replace them by masks designed from the best types of ancient sculpture, and has, it appears, made some specimens. It is difficult to see how even a Venus de Medici mask could be made beautiful with goggle lenses in place of eyes, but the idea might have other and somewhat startling developments. The proud owner of a new 70 h.p. Napier might wear a mask with the features of a well-known public character, and court, instead of defying, recognition while exercising his car, while when driving in his own neighbourhood a special one might be reserved for appearance in the police-court. In future the bystander who sees a motorist wearing a seraphic smile by the roadside while engaged in mending a puncture will cease to credit him with self-control; he will know that that smile was purchased along with the other accessories of the car. Another, modelled from a Medusa, might be carried to use on the cyclist who "hangs on" behind, or the crowd that collects on the occasion of a necessary stoppage. Many such adaptations might be suggested, but if the idea catches on it will probably bring about the numbering of cars, and a compulsory numbered "brassard" in addition.

MR. A. L. BARBER, President of the Locomobile Company of America, arrived in London on Wednesday last. He has brought with him a new long-distance touring steam-car, of which we hope to say more in an early issue.

THE Forman Motor Company have, during the past few weeks, fitted up a moderately large factory in Day's Lane, Coventry, for the purpose of manufacturing petroleum-spirit motors for the trade.

LONDON COUNTY COUNCIL AND MOTOR-VEHICLE REGULATIONS.

THE following is the report of the Highways Committee of the London County Council on the proposals of the Berkshire County Council that motor-vehicles should be numbered:—

"We have had before us a letter from the Clerk of the Berkshire County Council, forwarding a copy of a resolution asking the London County Council and the other County Councils in England to co-operate with that Council 'in drawing the attention of the Home Secretary to the way in which motor-cars now traverse the roads, and in suggesting that every car should carry a number in a conspicuous place, should be registered, and should be obliged to stop when signalled to do so.' Having given careful consideration to this proposal we are of opinion that it is not necessary for the Council to take any action in the direction indicated in the resolution, having regard to the fact that no complaints have been made to the Council of accidents having been caused by motor-cars in London, and that, by the regulations issued by the Local Government Board under the Light Locomotives Act, the driver of a light locomotive is required to stop when required to do so by any police-constable or any person having charge of a restive horse, and also to the admirable way in which the street traffic is regulated by the police. Moreover it has been represented to us that many motor cars are of the nature of private carriages, and that, as such vehicles when drawn by horses are not required to be registered or to carry a distinguishing number, the owners of private motor-cars would resent any regulations such as those proposed by the Berkshire County Council being imposed upon them. We recommend—That the Berkshire County Council be informed that, having given careful consideration to the suggestions contained in the resolution of that Council relative to the use of motor-cars, the London County Council does not consider it necessary as regards the County of London to make any representation to the Government with the view of each motor-car being required to carry a number, to be registered, and to be obliged to stop when required."

The Highways Committee of the London County Council are to be congratulated upon the attitude taken by them in this matter. There can be little doubt that fact of Mr. Mark Mayhew, the Vice-chairman of the Automobile Club, being a member of this Committee has had much to do with its satisfactory decision.

It is a little disappointing to learn that the prizes of £40 and £20 offered by the Royal Agricultural Society for the best agricultural locomotive oil engines exhibited at the Cardiff Show this week have attracted no entries.

A MILITARY *fete* in aid of the Soldiers' and Sailors' Families Association was opened at Aldershot, on Tuesday, by the Duke of Cambridge in the picturesque grounds of Government House. Mr. Richard Simmonds and Mr. J. E. Lawes had their motor-cars on the ground and took visitors for drives.

WHILST rounding a corner in Colchester a motor-car belonging to Mr. Scott, of Foxburgh Hall, Melton, crashed into a ladder that had been laid along the kerb. The ladder was smashed, and both the off-wheels of the motor-car literally flew to pieces, bringing the vehicle up with a jerk. Fortunately, no one was injured, but the shock must have been considerable, as the car, which was travelling at a rapid rate, weighs a ton and a-half.

GROUT BROTHERS, of Orange, Mass., have added a minor improvement, in the form of an extra lantern carrier, to their steam car. The carrier, which is lower than the regular one, brings the lamp in line with the water glass and the mirror, and facilitates both the reading of the steam gauge and the observation of the water level at night without an extra light.

MOTOR-CARS form a prominent feature of the pictures shown by the American Biograph at the Palace this week. The pictures were taken on the occasion of the recent demonstration to County Councillors at Sheen House, Richmond, and a number of well-known motorists can be recognised. Mr. C. Cordingley heads the procession as seen on the screen, followed by Mr. E. Hutton, and the big electric car of the British and Foreign Electrical Vehicle Company. Then come a number of voiturettes, a Century motor-tandem, etc.

THE PARIS-BERLIN AUTOMOBILE RACE.

THE first of what will probably be an annual international competition for motor-cars was inaugurated on Saturday last, when fifty-five motor-cars forming the touring sections A and B started from the Place de la Concorde, Paris, on a journey to Berlin, a total distance of nearly 743 miles. From 8 o'clock in the morning such crowds had collected to see the start that the police were obliged to take special precautions for the regulation of the traffic. The weather lent its most obliging aid in the shape of bright sun and clear sky, and indeed everything was propitious of a successful event.

The competition has been divided into three classes, namely: Class A, for touring cars whose owners wish to have their times taken at every available opportunity in order to show the merits of the various systems; Class B, for touring cars whose owners want to be restricted in the least possible manner and journey as they please; Class C for racing cars. The first two classes started on Saturday and are to cover the distance in eight laps over the following route:—

THE 40 H.P. PANHARD RACER (1901 GORDON-BENNETT AND PARIS-BERLIN TYPE).
[La France Automobile.]

	Miles.
Paris to Reims	107½
Reims to Luxembourg	128
Luxembourg to Coblenz	89½
Coblenz to Frankfort	79
Frankfort to Eisenach	112
Eisenach to Leipzig	106½
Leipzig to Potsdam	93
Potsdam to Berlin	19

The racing class took quite another route, starting on Thursday morning, so that they can arrive in Berlin on the same day as the other two sections, making the following laps:

	Miles.
Paris to Aix-la-Chapelle	282
Aix-la-Chapelle to Hanover	276
Hanover to Berlin	184

To say that the race has excited universal interest is to state a truism which cannot be denied: all along the route of both the tourist and racing sections there has been a veritable ovation. Wishing to see something of the tourist part of the competition I took up my quarters at Reims, at the Lyon d'Or, a favourite resort of mine and an excellent hotel just by the Cathedral, in front of which stands the new statue of Joan of Arc. The amiable proprietors, Mr. and Mrs. Radlé, gave me a room on the ground floor with one window looking out on the front yard and the other out on the back yard, where I could see

at my ease all that was going on, but which proved anything but comfortable under the circumstances, as the sequel will show.

The inward control at Reims was fixed about a mile out of the town on the road from Epernay, and, as is usual, I find, in motor-car races, the cars were expected hours before they arrived. So early as 10 o'clock the spectators began to arrive, whilst the first automobile only made its appearance at 12.45. The driver proved to be M. Debacker. After him the cars kept on arriving until nightfall, and I even heard that the drivers of two of them were apostrophising the night porter of the hotel because he refused to open the yard door for them and their panting cars during the small hours of the morning.

I remarked particularly amongst the cars the Baron de Zuylén's 20 h.p. Panhard. It is chiefly remarkable for its very long wheel base—two and a half metres. It is essentially a touring car, and is very roomy and comfortable, with six seats facing forward. I hear that, owing to the long wheel base, there is little or no shock in going over uneven places in the road.

There were three lady drivers, amongst them the Baroness de Zuylén, with a handsome hooded 8 h.p. Panhard, and Madame Gobron, driving a Gobron-Brillié, and effectually protected

from the dust by a wrapper which only left goggles visible. The Baron and Baroness de Zuylén are taking matters comfortably with quite a staff of servants travelling by rail with mountains of luggage. The Prince of Arenberg on his Panhard, using alcohol instead of *essence*, and driving himself, looked really sportsmanlike.

The hotel was of course full to overflowing, and Reims seemed to be a general rendezvous for those who wished, like myself, to get a glimpse of the tourist sections. I saw the two brothers De Knyff, Pinson, Mors, the Marquis de Dion, Deschamps, and many other well-known *chauffeurs*. I noticed a new De Dion voiturette in the competition, with the motor in front and with a universal-jointed central shaft. The car appears to be very high above the ground and does not seem to follow the usual lines at all so far as shape goes. I could not judge of its capabilities, as it was having trouble with its gear wheels.

There were two serious breakdowns, one with a new 12 h. Peugeot belonging to M. Flameng, which was caused by the bursting of a tire whilst descending a steep hill near Epernay. M. Flameng and his party were shaken, but not seriously hurt, and were obliged to return to Paris by train, the car being badly damaged. The other breakdown was a car on which was M. Ferrod, the representative of the *Daily Telegraph*. The car had a collision with a cart, and the occupants were thrown out. However, the only injury was a cut lip, and the party was able to continue. I saw M. Ferrod, with a bandage

round his chin, taking his coffee in the courtyard, and he did not seem much worse for his spill.

Watching motors arrive in the hot sun is trying work, so I retired to rest very tired, and promising myself to lie in bed late on Sunday morning; but, alas, at 5 a.m. began on each side of me by the window looking on to each yard, the "vrum" "vrum" of the big Panhards, and after struggling vainly for ten minutes, I had to get up.

The start from Reims was a complete muddle, and finally the competitors had to give up the idea of starting in any given order. The same difficulty occurred, I well remember, in the 1,000-mile tour in England.

A slight shower during the morning laid the dust, but the weather was on the whole capital, and no accidents marred the run to Luxembourg, where a party of Belgians had run over from Brussels to welcome the travellers. Between Luxembourg and Coblenz the weather held up, but it was hot and dull. The competition seems to have settled down to complete regularity, the only incident worth recording being an ovation to the lady drivers on their arrival and the offer of bouquets of flowers.

At Hanover on Friday, the 28th inst., the Continental Caoutchouc and Guttapercha Company of Hanover gave a dinner in honour of the competitors. The Lord Mayor and the Corporation of the City of Hanover being present at the dinner to welcome the competitors in the name of the City.

On Monday, Tuesday, and Wednesday, whilst the tourists were forging ahead towards a common goal, the Place de la Concorde in Paris was even more animated than is usually the case, and that is saying a great deal. From morning until night there was a continual crowd outside the A.C.F., and as every new car came up to be examined, numbered, and marked ready for its three days' race to Berlin, it was immediately surrounded by the curious, and its points discussed, very frequently much to the amusement of its owner. All Paris *qui chauffe* was about the gates or in the yard of the A.C.F., and also a liberal sprinkling of English, Belgians, and Germans.

A row of cars—great and little—stood outside in the Place, and one by one, as their turns came, they were called for and driven inside the enclosure of the A.C.F., there to be first examined, then to have a number painted on them, and, lastly, to be *plombe* by the custom-house officers, of whom a special corps were in attendance. To be *plombe* means having a piece of string tied round some fixed part with a lead seal crushed over the two ends of the string in such a manner that the string cannot be removed without breaking the seal. If, when the car re-enters France, the string and the seal are intact, it is a proof to the customs house that it is the same car which they marked, and it is allowed to enter duty free.

The racing class was divided into four categories, viz. :—

1. Vehicles (motor-cycles) weighing less than 4 cwt. 3 qrs. 20 lbs.
2. Vehicles (voiturettes), weighing between 4 cwt. 3 qrs. 20 lbs. and 7 cwt. 3 qrs. 14 lbs.
3. Vehicles (light cars) weighing between 7 cwt. 3 qrs. 14 lbs. and 12 cwt. 3 qrs. 5 lbs.
4. Vehicles (carriages) weighing over 12 cwt. 3 qrs. 5 lbs.

In the last two categories, at least two passengers sitting side by side, and weighing at least 154lb. each, must be carried. Three Belgian light 12 h.p. cars weighed slightly over the limit for class three and were obliged to enter in class four.

With the Parisians, Panhard cars are first favourites, with their twenty-five cars, Mors coming next. Serpollet is, however, considered to be the dark horse. Mr. Edge and his Napier are thought to be out of the running, on account of the influence of the weight on the tires. Although there is only one English-built car starting, there are six Englishmen driving, viz., Jarrott, Heath, Edge, Rolls, Collins, and Keene. I give them in the order of their numbers. There are fourteen Belgians and nine Germans, the rest being French.

I learn that M. Levegh, who was to drive perhaps the most perfect car that ever went out of the Mors works, has been persuaded by his friends not to compete. His health is not

equal to these tremendous trials, and his car will be driven by M. Antony, a driver well trained to the Mors vehicles. M. Barras, another prominent driver, whilst out trying his machine the other day, was upset, and sustained a broken collar-bone, so that he, too, was a non-starter.

On Wednesday evening, when the lists closed, there were 155 starters, and nothing could have been finer nor more propitious than the weather. At the last minute two motor-bicycles arrived from Prague, sent by the firm of Laurent and Klement.

Amongst the starters I counted twenty-five Panhards, seven Mors, four de Dietrichs, four Mercedes, twelve Darracqs, six Decauvilles, six Renaults, two Peugeotts, two Delahayes, two Serpollets, two Werner bicycles, and seven de Dion motor-cycles. An unfortunate accident at the last minute prevented one of the new Serpollet cars from competing, so that steam is only represented by a 20 h.p. and a 6 h.p. AUTOMAN.

(BY TELEGRAPH.)

PARIS, Thursday.—Notwithstanding the early hour fixed, an enormous crowd assembled at Champigny Fort to witness the departure of the cars. All night long automobilists, cyclists, and pedestrians poured in a ceaseless stream through the Bois de Vincennes, all hastening towards Champigny. At three o'clock all the competitors were drawn up in order, according to the numbers which had been assigned to them, and word was passed round to make ready for the start. Day was just breaking, and the temperature was still somewhat cool, when, at half-past three, the leading car, driven by M. Giraud, darted off amid the cheers of the crowd. The remaining cars started at regular intervals of two minutes. Mr. C. Jarrott went off at 3.50 in a Panhard car, and Mr. Edge, in his 70 h.p. Napier, started 4.12. A number of accidents occurred in the early hours of the morning on the road from Paris to Champigny. The engineer of a German car fell from his seat and was somewhat seriously injured. The actual starters numbered 110, and about three and a-half hours had elapsed when the last vehicle left Champigny.

BASTOGNE (BELGIUM), Thursday.—The first four motor-cars to pass through this place, which is about 209 miles from Paris, were those of MM. Fournier, Hourgier, De Knyff, and Farman.

THE Automobile Club of America is reported to have decided on the organisation of an annual fifty or a hundred mile road race. It is said that the first contest will be over the Buffalo-Erie course, about the middle of September. The contests will be open to all motor-vehicles carrying two persons. The Club will also promote annually a race for the one-mile record. It will be held over a course, subject to the consent of local authorities, and well guarded by police. Steam, petrol, and electric carriages will compete in separate classes.

THE secretary of the Automobile Club on Wednesday last had an interview with Sir Evelyn Wood at the War Office with reference to the offer of members of the Automobile Club to place themselves and their vehicles at the disposal of the War Office in connection with the manœuvres. There will probably be no large manœuvres in this country this year, but Sir Evelyn Wood is anxious to place the arrangement on a permanent footing. Possibly the Automobile Club may be asked to provide three or four vehicles in connection with the Volunteer cyclists manœuvres which are to be held by the War Office from the 3rd to the 10th August next.

MR. F. B. THANAWALLA, of Bombay, has recently imported a comfortable motor-car for use in India. The vehicle, which is of French manufacture, is driven by electricity. The batteries are placed under the seats of the car, which is of the "dog-cart" pattern, with accommodation for two passengers. The car is capable of running at speeds varying from three to sixteen miles an hour, and can cover a distance of thirty miles before the batteries require re-charging. We learn that Mr. Thanawalla has already received orders for several similar cars, which are being built in Paris.

FLOTSAM AND JETSAM.

BY "FLANEUR."

NOTHING seems to come amiss to the all-conquering auto mobile. It has crossed the highest roads in Europe, even the famed Stelvio Pass, 9,055 feet above the sea, having succumbed to the attack of an Austrian Count on a 12 h.p. Cannstatt Daimler. The enterprise of the French *chauffeur*, however, is turning itself in the direction of Algeria and Tunis. There was the tour of M. Turgan in the "Quo Vadis" caravan; Baron de Crawhez also took a party into the interior; and now, according to *L'Illustration*, M. Sébastien de Neufville, Madame de Neufville, and M. Napoléoni have completed a tour of five thousand kilometres with a 12 h.p. Panhard et Levassor. Crossing by steamer from Marseilles, they drove from Algiers to Tipaza, Marengo, Milianah, and other towns, and back to Algiers. Then they proceeded to Tizi-Ouzou, Philippeville, and Tunis, wherethey embarked for Marseilles, and drove to Paris by way of the Rhone Valley, Lyons, and Dijon, after covering three thousand miles in all.

SOME spirited sketches of the tour, from photographs by M. de Neufville, appear in a recent issue of *L'Illustration*. They depict the party wrestling with puncture troubles, for on the burning sands of Algeria the tires got overheated almost to melting point, and frequent stoppages were necessary in order to allow the rubber to cool. When water could be obtained it was poured over the tires. Despite all precautions, however, punctures were more frequent than pleasant, but were philosophically endured. In Tunis the chief incident was the narrow escape from swamping which the party had when crossing a ford, owing to a sudden uprising of the waters. The natives everywhere were very friendly to the tourists, and accepted the new means of locomotion with Oriental composure.

ANOTHER interesting trip was that of Count Carl Schönborn-Bückheim, who took his bride from Rome to his ancestral home in Hungary by means of a 14 h.p. Benz double phaeton. A considerable number of illustrations of the journey are published in the *Allgemeine Automobil-Zeitung*, the official organ of the Austrian Automobile Club. They show, among other views, the car ascending and descending Mount Vesuvius, over a road that looks none too comfortable as to surface, and with very acute corners. The entire journey was successfully carried through, however, and a coloured supplement which illustrates the car itself shows it to have been a very smart-looking vehicle, painted white, with fine red lines, brass mountings throughout, and a hood to the rear seat.

It appears to be a cardinal principle of every London penny morning journal to have no mind of its own on coming movements, but tamely to follow the trend of public interest and opinion. In this respect the halfpenny papers have shown far more prescience and enterprise, as witness the length of time and the assiduity with which the *Daily Mail*, the *Daily Express*, and the *Morning Leader* have not merely "noticed" the automobile movement, but have actively encouraged it throughout. Obviously it is far more in consonance with the highest ideals of journalism that a paper should lead rather than follow, and it must be pronounced eminently unsatisfactory that the older journals should have allowed themselves to be elbowed out in this matter by their younger rivals.

The penny papers might easily have moved the clock forward by a couple of years had they been duly alive to the importance of automobilism, and there is not the slightest doubt but that we should be still further behindhand than we are without the generous encouragement of the *Mail*, the *Express*, and the *Leader* above named. Their educative influence has been undoubted, and also far-reaching as well. Their circulations are very large, and the fact that they cost but a halfpenny does not at all imply that they appeal to the unimportant sections of the community; a glance round any first-class carriage in a

morning train to town at once dispels a notion of that kind. But whereas there are three halfpenny morning dailies there are seven penny ones, not counting sporting and financial organs, and it cannot be said that the influence of these seven has been actively exerted in favour of a means of locomotion which will revolutionise the traffic of the civilised world.

FROM this state of things there is only one satisfactory inference to be drawn. The penny dailies are mostly behind the times; when, therefore, we do find them giving liberal room to any given movement it is an all but infallible sign that that movement has unmistakably "arrived." During the past week an unusual amount of space has been devoted to the Paris-Berlin races far more than was the case with the previous run to Bordeaux. It is clear, therefore, that the existence of the automobile is at last regarded as a great fact, and whether it is the Kaiser's prize, the remarkable time made by Fournier, or the King's interest in the movement which has stimulated the sluggishness of Fleet Street, the outcome is one which we may accept with becoming gratitude.

THE telegrams from Paris and Berlin nevertheless show the sub-editors in some cases to have been considerably at sea regarding automobile nomenclature. Even the *Daily Mail* on Tuesday "piled Pelion upon Ossa" in the matter of its blunders. What is a "Mars" car? What, too, is a "Meteor?" And who is "Janatzki?" and what is a "Serpolette?" If the *Daily Mail* had said "Mors," "Napier," "Jenatzy," and "Serpellet" it would probably have expressed the intentions of the transmitter of the telegram. Even more humorous was the curious inscription appended to one of some interesting sketches which the *Daily Graphic* published on Monday, illustrative of the scene outside the Automobile Club de France on Saturday at the start of the touring cars. "The Customs Testing Instrument" is the title given to a drawing of the usual iron which everybody who has crossed a frontier knows is simply used to affix the official *plombe* of lead which secures re-entry into the country without payment. The bare idea of a Customs officer being competent to "test" a motor-car is too comical for words. Many are the frontiers I have crossed, but an intelligent *douanier* is an individual I have rarely had the felicity of meeting. Competency apart, however, it need scarcely be pointed out that it is no part of a Customs official's duties to "test" a car or anything else; his concern is the collection of the impost, not the mechanical efficiency of the vehicle.

A SERVICE of electric omnibuses between Oedingen and Bilstein, Bavaria, is projected.

MESSRS. COURTAULD, the well-known textile manufacturers, are about to try a motor-lorry for haulage purposes. If the experiment proves successful the automobile will displace the present two-horse coaches between their silk factories at Bocking, Braintree, and Halstead.

MR. GEORGE ACE, who enjoys the unique privilege of being the sole proprietor of motor-cars for public service in the county of Pembrokeshire, stocks petrol and all accessories at his establishment, adjoining the railway station at Tenby.

MESSRS. G. F. MILNES AND Co. (Motor Department), of Balderton Street, Oxford Street, London, are now equipped with the most modern appliances for motor-car repair work, and have a large staff of skilled workmen constantly in attendance. Petrol may also be obtained at any hour from their premises.

MR. ALFRED J. ALLEN, who, at the beginning of the South African war, suggested the use of a six-wheeled armoured motor-car, capable of going backwards and forwards with equal facility and of manœuvring in a small space, has again intimated that the War Office is quite welcome to the design.

SAYS *The Gentlewoman*:—"Now that week-end parties are so rife, and to spend Sunday in London is to argue yourself unknown. Motors are becoming indispensable almost. You save yourself so much wear and tear. No rush to the stations, no porters, no bother. You simply fly from door to door."

MOTOR-CARS IN HYDE PARK.

THE FASHIONABLE ASPECT OF THE MOTOR-CAR.

SURELY, when that far-seeing lady Mother Shipton spoke of carriages without horses, she had in her mind's eye the motor-car, destined to mark as great, if not a greater, social revolution in the first decade of the twentieth century than did the railway engine during the early Victorian era. It is with us, its possibilities are realised, its necessity also, and it will stay. Our children will laugh at the opposition raised against it in certain reactionary quarters, just as we, as children, laughed at John Leech's clever drawing of the dear old gentleman saying, "Railways, sir! I hate them, and the sooner they are done away with the better!" Unlike the cycle, its immediate predecessor, the motor-car is a distinct labour saver, and not a mere outlet for superfluous energy, destined to be shelved whenever caprice or fashion may lead that superfluous energy into another channel.

It was the sight of many motor-cars met in Piccadilly the other day as we made our way West, determined to spend a quiet afternoon "on the benches in the park," that set this chain of thoughts rattling. Motor-broughams, landaus, and victorias passed in rapid succession; men in smart liveries on the boxes, and their occupants invariably fashionably-attired women, who, to judge by the absence of the sterner sex and the direction taken by the vehicles, were on shopping bent. Whilst pondering over this agreeable testimony to the docility of the much-maligned motor-car, we came to Apsley House just as a Locomobile swung into the carriage drive, pulled up in a trice, and deposited its occupant safely on the pavement, whence he gained the portal in two strides of importance and despatch.

But before we had been many minutes in the Park we had further and convincing evidence that Society has followed the Royal example and gone a-motoring. In twenty minutes we counted as many motor-cars; and what was most remarkable about them was that almost without exception they contained ladies only, and were driven by uniformed *mecaniciens*. The amateur enthusiast was remarkably conspicuous by his absence. Without a doubt Society has taken to the motor-car, and taken to it seriously, too. And where were the disadvantages we read about? Not a single car had the noise or rattle of a horse-drawn vehicle, and, thanks to a well-made and well-kept road, not a particle of dust did one of them raise. As to sitting cheek by jowl with one's coachman, there was none of it in the well-turned-out broughams, landaus, and victorias we saw. It is only on the record breaker, where every available inch of space is required for machinery, that this is necessary; and English ladies have not yet taken to racing. The so-called hideous costume so often railed against we looked for in vain. On the other hand, smart frocks, fit for a garden party or afternoon call, were the order of the day. Even in the motor-car itself we could find no fault. Generations of usage may have accustomed us to the sight of horses in front of all vehicles which do not run on lines, but to our way of thinking, the graceful evolutions, easy running, and perfect control of the motor-cars which we saw bearing their fair freight round fashion's arena at twice the pace of any horse-drawn vehicle, more than compensated for any amount of foreshortening.

As to the horses passed and repassed continually, they took no more notice of the cars than the cars took of them. Possibly they had their own troubles, of which overwork was not the least. One handsome equine equipage attracted our attention as it approached by the signs of distress exhibited by the near side horse—distress which evidently caused much alarm to the two ladies inside the carriage, who left it hurriedly. Meanwhile the symptoms of distress grew. A sympathetic crowd unharnessed it, a kindly policeman patted its face, a chair man ran for a bucket of water, and an old lady fumbled for her smelling-salts. But all to no purpose; its work was over for that day, at least, and a groom led it slowly away, whilst the coachman drove the empty single-horsed carriage home. Horse is but flesh and blood, and therefore as unreliable as man. A chill taken the night before whilst

waiting, a touch of the sun, or a mile too much, and a hundred and one other considerations which do not affect a motor-car, are an ever-present source of anxiety to the careful owner of horse-flesh. Nor are bodily ailments the only disadvantage presented by the horse. Disposition, nerve, and temper have sometimes to be reckoned with even in Hyde Park. Only one day this week a painful illustration of this fact was witnessed near Grosvenor Gate, when a pair attached to Lady Walters' carriage bolted, for no known reason, deposited her ladyship and daughter in the road, seriously injured coachman and footman, and, fortunately but slightly, a gentleman who pluckily attempted to stop the runaways.

Comparisons are, however, but odious, and from these we turned our attention to a serviceable-looking Panhard that bore signs of a long journey. In the *tonneau* sat the *mecanicien*, and on the box a lady taking a lesson in driving from the gentleman beside her. Now, had this been a horse-drawn vehicle, what gentleman would have dared to put his coachman inside and drive him round the Park? But the motor-car is an emancipator, and the fair *chauffeuse* drew not a single frown from disapproving Society.

Passing Achilles we came to Grosvenor Gate and turned into Brook Street, where is situated the Mecca of afternoon motorists—Claridge's Hotel. Outside this famous hostelry might have been an annexe of the Automobile Club. There we recognised the Baron de Meyer's electric car, Mr. H. H. Baring's *tonneau*, and several others owned by well-known motorists. Inside, in the spacious hall, devoted to tea at this hour of the day, were the rank and fashion of the motoring world, too numerous to name.

But it is not only for a drive in the Park that Society has adopted the motor-car. A run to Henley, Windsor, or Brighton and back in the day is quite possible, even with a most important evening engagement in view; and that without the harrowing thought of a train to catch. There are also signs of the decentralisation of London's fashionable centres. Society leaders are moving farther afield, and yet maintaining touch with the world. From the many beautiful and healthy suburbs that form a ring round London, and pleasant towns still further away, the motor-car brings its evening consignment of diners and theatre-goers. In the near future we may see Belgravia as forgotten as the Bloomsbury of our forefathers.

THE Silesian Automobile Club has just been formed in Breslau, Germany.

M. JEANTAUD has been elected president of the French Chambre Syndicale de l'Automobile for the year 1901-2.

THE Austrian Daimler Motor Company have just supplied a 16 h.p. omnibus for service between Bozen and Mendel, in Austria.

WE hear from New York that negotiations are in hand there regarding the sale of the American rights in the Singer motor-bicycles.

THE Chicago Automobile Club has taken the same steps as the Automobile Club of America to prevent racing in club outings, a pacemaker having been appointed to lead the way, etc.

ORDERS for two 30 h.p. Panhard cars have just been secured by the British Automobile Commercial Syndicate, Limited. One of cars is for Mr. W. B. Avery, of Windsor; and the other for Colonel H. M. Calmont, M.P., of Newmarket.

THE Northfleet District Council have examined and passed a second motor-car which was produced for their inspection by Mr. William Smith, of New Road, Gravesend, and ordered that a licence to ply for hire in Northfleet be granted to the applicant.

THE Yorkshire Automobile Club will hold a two-days' run to Doncaster and Worksop, to-day (Saturday) and Sunday. The meeting place is Manningham Park, Bradford, which will be left at 2 p.m., Worksop being reached the same evening. Sunday morning will be spent in a visit to the Dukeries, the return journey being made in the afternoon.

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs.

A VISIT TO THE GARDNER-SERPOLLET WORKS.

BY AUTOMAN.

M. LEON SERPOLLET, whom I have known slightly for some years, invited me out the other day to see his new works, in the Rue Stendhal, Paris, and as I thought it would interest the readers of the *Journal* to make closer acquaintance with him, I took out my camera and notebook and asked his permission to use them. The permission was given, subject to the condition that I should be very discreet about the vehicles that were being prepared for the Paris-Berlin race. Everyone knows that M. Serpollet has entered three cars,

MR. A. HARMSWORTH'S 12 H.P. CAR

and though I had the advantage of inspecting the vehicles in process of manufacture, I must for the present say nothing about them. The works are very compact and thoroughly up-to-date, consisting of two large one-storey sheds; one shed is used for the offices, etc., while the other is divided, one side being occupied by the machine tools, and the other side used for the purpose of erection. At the present time the works are engaged

A SERPOLLET 6 H.P. CAR.—M. SERPOLLET AT THE WHEEL.

on 6 h.p., 8 h.p., and 12 h.p. cars, of which some 180 in all have been already made and delivered. The capacity is at present about one 6 h.p. car per day and one 12 h.p. car per week.

"What do you think of the future?" was my first question. M. Serpollet smiled, and replied, "Why, of course, I think that the motor-car of the future will be actuated by steam. I am

making," said he, "improvements and simplifications day after day, and I believe that shortly my car will be simpler to work than an electric car; my new pedal, for instance, regulates the admission of the water to the boiler. In my new 6 h.p. car the boiler is about twice the size of that of the 5 h.p. car, which I have now abandoned. You see, steam itself is so cheap that there is no need to save it." This car will only weigh about 650 kilos, and will sell for 6,800 francs. The engine gives more than 1 h.p. more than that of the old type. All the working parts are enclosed and run in oil baths. This car attains a speed of about 72 kilometres per hour on the road with three people up

A VIEW IN THE GARDNER-SERPOLLET WORKS.

"What about the 12 h.p. car?" I asked. "Why," was the reply, "my 12 h.p. tourist car weighs 1,300 kilos.; my racing car only 1,000 kilos. I have already delivered some twenty of them, and they are giving great satisfaction." "But what about the trouble of having to stop to take up water?" "Well," replied M. Serpollet, "We have got over that to a great extent; I can do over 120 kilometres on my 12 h.p. car without taking water; in fact, much more." "Are you not making a car for

ANOTHER VIEW IN THE GARDNER-SERPOLLET WORKS.

King Edward VII.?" I said. "Yes, I am, and it will be delivered in about three weeks," replied M. Serpollet, "and I have quite a number of orders from distinguished people; you know that the Shah of Persia has three of my cars, and one of his ministers one. I have received orders from Prince Alexander of Oldenbourg, the Duke of Leuchtenberg, Baron Friedericksz, Baron Arthur de Rothschild, Lord Wolverton, and quite a number of equally well-known persons."

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

M. Leon Serpollet is a man of forty-three years of age, and was born at Culoz, in the department of Ain. It was in his father's carpenter's shop that he and his brother Henry commenced the first experiments in 1877. His fixed idea was to produce a steam engine in which, instead of having a boiler with a large reserve of water and steam, the engine itself should pump into a, so to speak, empty red-hot boiler sufficient water for its actual instant requirements. M. Serpollet has clung steadily to this idea, which finds its practical use to-day in his automobile, and crowns the exertions and difficulties of his youth.

The advantages claimed for the Serpollet car are, in the first place the fact that it burns ordinary paraffin, which is less dangerous and much cheaper than petrol; the boiler is made entirely of thick steel tubes, and cannot explode or burn out; even if a joint were to give way, the quantity of steam contained in the boiler is so extremely small that no harm is done. There is no constant changing of gears, and consequently the repairs are very much smaller than in oil cars.

THE SONCIN MOTOR.

ALTHOUGH a good deal has been heard at different times of the Soncin motor, owing to the high speeds attained on motor-cycles fitted with it, its special features have not, so far as we remember, been illustrated and described. In general appearance the engine resembles the usual type of vertical air-cooled high-speed petrol motor; it is made in two sizes— $3\frac{1}{2}$ h.p. and $4\frac{1}{2}$ h.p.

Reference to Figs. 1 and 2 will, however, show that the side of the cylinder is drilled, around one line, with a series of holes; these holes are placed in such a position that the exploded gases can escape after the piston has been forced to the end of its stroke. The arrangement embodies, in fact, a premature

FIG. 1.

FIG. 2.

exhaust, so that the hot gases do not remain so long in contact with the walls of the cylinder, the sudden expansion helping to reduce the temperature. This very ingenious arrangement has the unfortunate drawback of being very noisy, and rendering lubrication of the cylinder almost impossible, the oil being projected through the openings. The makers of the engine have, however, recently introduced a modification by which the holes can be covered up, or opened at will, by means of a lever; by this arrangement streets and roads can be traversed without frightening animals and people with the intense noise of a continual fusillade. Messrs. Ruffier-Marnier and Company, of Boulevard Gouvion St.-Cyr, Paris, inform us that the Soncin motor is also now being made—water-cooled—in sizes ranging from 6 to 24 h.p.

A LADY'S EXPERIENCES ON A MOTOR-TRICYCLE.

LAST year I went to the Tilburstow hill-climbing competition on a humble bicycle. My husband wanted our car, so, not to be balked, I rode from town. I was alone, but I spent such an enjoyable and interesting afternoon that this year, although in the country, I resolved if possible to attend the meeting for the second time. Then it occurred to me, why not enter my De Dion tricycle with Whippet trailer? I wanted the fun of the ride and the outing, and although I fully expected not to shine at a public competition, that was a secondary consideration. Success can only be gained by experience. So we got all in order, and started gaily at nine o'clock on Thursday morning, June 13th. I don't mind confessing that I felt very adventurous although I had twice previously ridden the tricycle down from town, a distance of eighty-six miles. The road from Harboro' to Northampton is exceedingly hilly, but our combination made nought of the ascents, and we reached Northampton under the hour. From this point, we made excellent time, averaging over twenty miles an hour. We reached St. Albans at 12.25 after practically a non-stop run of sixty-six miles. We got down twice to have a look round, and once for a stretch of treacherous metal. Our engine behaved splendidly, and although we hustled along, it never once showed the slightest tendency to overheat. We romped up Dunstable Downs, leaving the poor cyclists toiling wearily in the rear. At St. Albans we lunched, and then pursued the journey to Barnet.

Hitherto, our progress had been one of uninterrupted pleasure. We had taken it in turns to drive and were well pleased with our conveyance. But who shall describe the road from Barnet into London? It is a disgrace to any civilised town. The jolting and shaking we received were something awful, and to go fast was out of the question, let alone the severe policemen who lined the highway. "Why are you pulling up?" I inquired of Brooks, who had the seat of honour in front. "I've got the stitch that bad, ma'am, I can hardly stick on," was his piteous reply. I made a mental note of the observation, and determined to take my full share of the bumping on the return journey. Fair play is a jewel, no matter what a person's station may be in life. In spite of the state of the road, we reached Regent's Park in five hours from the start, and proceeded to Clapham Junction, where we lodged our machine with Mr. Linley, of the Whippet Cycle Works. A day of rest proved welcome, for, to tell the truth, I ached all over, much as one aches after the first hunt of the season.

Saturday, the 15th, saw us off in good time, and we jolted and bumped our way out of town, *via* Tooting and Mitcham to Godstone. Such villainous roads! They really appal country people accustomed to a decent surface. Arrived at Tilburstow, we at once climbed the famous hill. Our engine was nicely warmed, and we ascended in splendid style, much better than later on in the afternoon. The pretty little country common in front of the village, with its duck pond, its grazing horses and old men sitting placidly smoking their pipes under the shady trees, was truly typical, and gladdened one's eyes after the roar and bustle of the dirty streets. Presently, car after car came rolling up, attended by the smaller fry of Werner bicycles and tricycles. It was a most interesting spectacle. Unfortunately, the main road was up for drainage purposes, which led to some confusion. The afternoon was glorious, and the proceedings were an unqualified success. It was worth going miles to see the manner in which Mr. Mayhew's beautiful 20 h.p. Panhard flew up the hill; but its performances were eclipsed by Mr. Edge on the mighty 70 h.p. Napier. By the way, why is this celebrated car sometimes described as 50 h.p., sometimes as 70 h.p.?

A lady competitor on a tricycle, with a pair of very dusty boots and an equally dusty skirt, was possibly somewhat of a novelty. If she bungled matters and made a fool of herself, she can only crave indulgence for her shortcomings. To start at a moment's notice up a severe hill with your engine cold is not quite the same thing as climbing an ascent at your leisure and

with your mixture already nicely regulated. We discovered too late that we were suffering from a loose connection, the result, no doubt, of the awful shaking up on London roads. However, we achieved the ascent—if not quite so successfully as in the forenoon—and wended our way back to town in haste, having a dinner engagement. The next morning we started for home at ten, and had a splendid run as far as Newport Pagnell, the tricycle running in magnificent form. Here we lunched; but on proceeding on our way, the engine took to missing. We set the trembler, tightened the plug, which had also suffered from the Barnet road, and reached Northampton shortly after two o'clock. But from here our good De Dion began to falter, and, after crying a halt, we finally opened the battery case, and discovered the terminal had been jolted completely out of position. We re-attached it, but finding matters not quite all one could wish we switched on our spare battery, when lo! off she bounced as gaily as ever, and brought us home in gallant style at 4 p.m.

MARY E. KENNARD.

THE prize money in the recent Paris-Bordeaux race amounted to £460, of which M. Fournier and M. Giraud each take £80.

IN connection with the Henley Royal Regatta on July 3, 4, and 5, Mr. J. A. W. Ratty, of Henley-on-Thames, has arranged for a cycle and automobile *garage* inside the regatta meadows.

THE King and a party of guests left Sandringham on Monday afternoon for London. His Majesty rode to Wolferton Station in his motor-car, and was given a hearty reception by crowds gathered to witness his departure.

MESSRS. PANHARD AND LEVASSOR, of 14, Regent Street, London, W., now stock Clipper-Michelin tires (Panhard size). They have also opened works and a *garage* at Hanover Gate, Regent's Park, where repairs can be promptly executed and spare parts for all of their cars obtained.

PRINCE MAX VON FURSTENBERG has discovered a new way of going to Court. Advices just to hand state that he has driven from his castle at Donaueschingen, in Bavaria, to Prague, in order to pay homage to the Emperor Francis Joseph. The Prince drove a 12 h.p. Panhard, and did the journey of 367 miles in nineteen hours.

THE Russian Customs authorities have decided that when, in the case of automobiles with undetachable motors, it is impossible to ascertain, from invoices or other documents, what is the actual weight of the motor, such weight will, for the purpose of calculating the duty leviable thereon, be taken as equivalent to 30 per cent. of the weight of the car with the motor attached.

A KEEN rivalry appears to have been set up among the makers of electric vehicles. The recent lengthy run of the car of the British and Foreign Electric Vehicle Company, on a single charge, has induced the Canadian Electric Vehicle Company to attempt to go one better. The cars of this firm are on the Still system, and a new form of battery has lately been applied thereto, which will be put to a practical test during the present week in an endeavour to eclipse the recent achievement.

IN a circular just issued to the shareholders, the directors of the Motor Manufacturing Company, Ltd., state that they have decided to limit, as far as possible, the production at the works (other than trade vans) to two types of motor carriages, namely, the *voiturette* called "The Miniature Panhard," fitted with the company's 5½ h.p. water-cooled De Dion type motor, and the new light carriage fitted with the two cylinder 7 h.p. Panhard type motor. A large number of each of these specialties have been laid down and are now being produced.

MANUFACTURERS and agents who are entering vehicles for the Glasgow trials should bear in mind that it is the intention of the Trial Committee to recommend to the Judges Committee that special tests should be held to ascertain whether the vehicles are fitted with sufficient brake power, and especially that the brakes are to be so constructed that they will prevent the vehicle from running backward if stopped on a stiff up gradient. It is suggested that the certificates to be given in connection with the trials should be endorsed with a statement as to the efficiency of the brakes in this respect.

THE SINCLAIR VARIABLE-SPEED GEAR.

DURING the past few years there have been several attempts made to devise a reliable system of variable gear by means of expanding and contracting pulleys, a number of which have been illustrated and described in the *Journal*. One of the latest devices of the kind is that which has recently been introduced by Mr. A. Sinclair, of Portobello, Edinburgh, and of which illustrations are given herewith.

To attain the variation of speed, the driving and driven pulleys are each made so that they can be increased and decreased in diameter, and for this purpose are each constructed in two separate sections, the outer flanges of each section being formed or built cone-shaped from the hub to the periphery, the arrangement resembling two truncated cones. Any desired number of radial slots are formed, extending from the hub to within a short distance of the outer edges of both of the sections of the pulley, to receive a corresponding number of "sectors" or "dogs,"

which form in their centre the plates on which the belt runs. The sectors are connected up to the two cone-shaped sections of the pulley by insertion in radial slots, means being provided at the ends for attaching them to a smooth plate or to either ball or roller bearings which ride up and down upon the cones as the sectors are expanded or contracted.

A half-section of each pulley is allowed lateral movement along the shafts, but is kept rotating by a key let into the shaft engaging with slots in the hubs, the other two halves being keyed fast to the shafts. The method of contracting and expanding the two pulleys is plainly shown in the illustrations, the pulley in the model from which these were made being proportioned in the ratio of 4 to 1. The belt shown is simply an ordinary strap, the pulleys being built to take a 3-in. belt. Arrangements are also made so that a lever may be used for working the pulleys instead of the handle shown. In the event of the belt stretching it can easily be taken up by a simple attachment connected to the clutch of the driven pulley, which will expand the sectors until the proper tension is obtained. This is done when the pulley is at its smallest circumference.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

CONTINENTAL NOTES.

BY AUTOMAN.

THERE is a new project on foot in France for the regulation of the speed of motor-cars, which does not commend itself either to the users of automobiles or to the public, and which it is to be hoped will never become law. The new scheme provides for the attaching of two large numbers to all cars capable of exceeding the legal limit—that is to say, a speed of $18\frac{1}{2}$ miles per hour in open country. The proposition can hardly have originated with anyone cognisant of the question, for it is evident that almost any car can exceed that speed down hill, and again, the change of the chain pinion is all that is necessary to make the fastest car incapable of exceeding $18\frac{1}{2}$ miles per hour, or this can equally easily be accomplished by altering the governor, so that the fastest car may pass an examination and be certified correctly as exempt from the numbering regulation and yet five minutes work on the regulator of the same car will enable it to do fifty miles an hour.

A SECOND point in the proposed regulations is equally open to grave objections. It is suggested to have less "tooting" and only to allow the horn to be used for giving warning of the arrival of the car in dangerous places. The restriction to tooting, however much we may all be in favour of diminishing its annoying persistency, is fraught with many difficulties and risks. For instance, the unfortunate motorist will be continually in the quandary of having to choose between being summoned for unnecessary "tooting" or being prosecuted for not having "tooted" in case of an accident. Naturally he will choose the first and less serious alternative, and the "tooting" will go on just as before.

THE Baron de Zuylen, at the dinner which he gave to the winners of the Paris-Bordeaux race, told an amusing story of what happened at the banquet given to Levassor on the occasion of his winning the first race to Bordeaux and back. One of the speakers proposed the health of the winner, but added that he also drank to the health of him who would in the future average 80 kilomètres per hour instead of 22 kilomètres. Levassor, on hearing this, leaned over to the Baron and said, "What a pity it is that on these occasions someone always makes a fool of himself."

LAST Saturday's *Vélo* has on its front page a paragraph headed "Le Bluff de Edge," with an evidently inspired article and a letter from the pen of Mr. D. M. Weigel, and over his signature, in which letter French automobilists are all challenged by Mr. S. F. Edge to a speed contest with his 70 b.h.p. Napier. Mr. Weigel conveys in his letter the idea that this challenge is made public in France with Mr. Edge's consent. Osmont, the motor-cyclist, is the first to express his willingness to take up the challenge, and quite an interesting event may be anticipated as the result. Now that there has been time to test and complete the Napier, and that the Paris-Berlin race will give further experience to its driver, it would be a feather in Mr. Edge's cap, and every Englishman would be delighted to see him turn what the *Vélo* calls "bluff" into serious earnest.

To judge from the record which Mr. Edge made on the road to Chartres last Sunday, it will be a very close contest. It seems that in order to make a test of the speed of the Napier, Mr. Edge secured the services of Mr. H. J. Swindley, who timed him first over a measured kilomètre and afterwards over a measured five miles. The kilomètre with a flying start was accomplished in 32.25 seconds, at a speed of 111 kilomètres or just over $68\frac{1}{2}$ miles per hour. The five miles was accomplished in 4 min. 44.35 seconds, or at the rate of nearly $63\frac{1}{2}$ miles per hour. This beats any record of speed publicly made and Mr. Edge so far holds the palm.

THE tour of Holland organised by the Dutch Automobile Club has excited the same enthusiastic reception along the route as did the famous 1,000-mile Trial in England. The Dutch are

not a demonstrative race, and it is all the more striking and agreeable to those interested in automobilism, to hear that along the line of route schools have been closed in order to allow the scholars to witness the passage of the cars, houses have been decorated in their honour, and even business houses have given their workmen holidays. At Barne, for instance, the houses were all beflagged, bands were playing, and an enterprising horticulturist rained roses on the heads of the competitors.

THE Board of Public Works in Italy have just approved new regulations for motor-cars on the public highways. The maximum limit of speed is to be nine miles in the towns, and eighteen and a-half miles in the country. All who wish to drive motor-cars must pass a public examination, and obtain a certificate of competence.

AN automobile race has taken place in Alsace-Lorraine from Strasburg to Mullhouse and back, ninety-six miles. The heavy rain made the roads very bad, and yet the winner, M. Varlet, covered the distance in one minute over three hours, doing an average of nearly thirty-two miles per hour.

THE motor-car in France has made another great conquest for it has been acknowledged by the Church. A certain devout gentleman, lately becoming the owner of a motor-car, has had it blessed by the curé of Stains. *La Locomotion Automobile* suggests that a suitable patron saint for automobilists would be St. "Panne," who suffered martyrdom in Africa.

CORRESPONDENCE.

THE SPRAG DIFFICULTY AGAIN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Thatcher's inquiry *re* sprags on his car; if he could fit the contrivance with which the $3\frac{1}{2}$ h.p. Gladiator voiturette is provided, he would overcome all his difficulties. It is a small lever that acts on the differential gear, and it absolutely locks the back wheels. It is put into operation by a small handle on the steering-post.—Yours faithfully,

J. CUSINS NIXON.

BRAKE POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be very glad if some reader will advise as to increasing the brake power of a Clement-Panhard. The pedal brake working on the countershaft is insufficient alone, and I am reluctant to use the tire brake. I should like to know what I can add to render me independent of the tire brake.—Yours truly,

STEPHEN DE SAVE.

THE GRADIENT OF SUNRISING HILL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be pleased if any of your readers could tell me the gradient of Sunrising Hill. It lies between Stratford-on-Avon and Banbury. I was told by the villagers that it was much steeper than Edgehill, but I cannot find it mentioned in any Contour Road Book. It seemed to me much stiffer than any hill encountered on the 1,000-mile Trial.—Yours faithfully,

FRITZ MUHLENKAMP.

A CHALLENGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having seen a letter from Mr. S. F. Edge in one of the papers, stating that he is willing to accept a challenge for a race with his Napier car, I beg hereby to challenge him for a race of 400 miles, to be run before the 1st August next. Hoping that Mr. Edge will see his way to accept above,—Yours faithfully,

pro MAURICE FARMAN,
D. FARMAN.

COST OF REPAIRS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. A. H. Nister's enquiries in your issue of the 22nd inst., I would like to mention that my car is a 6 h.p. Daimler Mail Phaeton. It was built in Coventry, the body being by Mulliner, of Northampton. The tires are solid. I have not kept a strict account of the mileage covered, but reckon it by the consumption of petrol. In twelve months I used over 400 gallons and this at fifteen miles to one gallon equals 6,000 in one year over roads made chiefly of flint. I am using the same tires still, but intend renewing those on the hind wheels next month. This is not absolutely necessary, but I prefer to do so to save the rims, which are of more importance, even though the rubber might possibly be used a little longer. The front tires will last out two sets of hind ones, as they do not drive. Pneumatic tires would be a source of constant worry in a district like this, and as I use my car in my practice I must run no risk of delay such as a puncture would mean.

The only repairs necessary to my car during the fifteen months were four times the valve spindle broke, but as I always carry spare valves I was not delayed more than ten minutes, on an average, renewing this, and the cost of each spindle was 3s. 6d. Twice I had the top shaft brass bedded down and renewed and this was a preventable trouble that I might draw attention to now for the benefit of owners of Daimler cars built over one and a-half year ago. The bearing at the bevel end of shaft was lubricated by a shallow cup into which the grease splashed when the car was running. When putting the countershaft wheels into gear they often struck the bevel wheel, and small particles of the hard steel chipped off. These were caught in this cup and sucked into the bearing with the grease; the result can be imagined. This happened twice before I hit on the cause, and, with the kind assistance of a friend, devised its cure. I now have a lubricator on the dashboard, with a strong spring in it; a copper tube runs from this, through the lid of the gear box, into the top of this bearing, and so it is provided with a constant supply of grease. I had brasses made somewhat small, and put in a shaped liner of brass under each. When the brass is a little worn, I merely take out the liners and file them down—this is a very simple thing and saves much trouble.

I did not have any other troubles, except to clean my lamps and change the wicks occasionally. I take a personal interest in the car, and do not allow it to go untended. After fifteen months' wear I drove it to Coventry from Windsor, and did not do a single thing on the way, except replenish the petrol from my extra supply tank. When the car was tested there, it gave over $5\frac{1}{2}$ b.h.p. I had the engine taken down and compression plates put on the pistons, and it now gives 6-8 b.h.p. These things, however, cannot be called repairs during the one year and three months referred to. I also, during that time, had wheel steering put on instead of tiller steering, and had a number of minor improvements added. The bottom of the water-tank had rusted, and I had a new one put in instead of having it patched, and then put in a new top speed-ringer.

If Mr. A. H. Nister lives anywhere in this neighbourhood I should be pleased to show him my car, and let him see how it is kept. The mistake most owners make is that they trust the lubrication and care of the machine to young men who know nothing of engineering, whereas no one would ever trust a valuable pair of horses to an odd man. I have made a rule now, and impress it on a man when he comes to me to clean my car, that I will not give him a character as a motor-car driver unless he stay with me two years and is strictly sober.—Yours truly,

H. E. BRUCE PORTER.

GOODS SERVICE FOR SURREY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A paragraph appears in your issue of 22nd inst. relative to a suggested motor goods service for Surrey. It may interest your readers to know that a scheme for conveyance of goods between Guildford, London, and intermediate places has

for some little time been developing, and arrangements are approaching completion.

The contemplated syndicate has already secured support to the extent of about 2,000 tons per annum of a class of goods for which high rates are paid to the railway company.

I shall be happy to hear from any correspondent who may be disposed to co-operate either financially or commercially.—Yours faithfully,

J. JAMES BAILEY.

THE PREVENTION OF SIDE SLIP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—While reading Mr. Sennett's able and interesting article, "A Run Across France on a Racer," I was extremely surprised to find that a gentleman of his well-known and admitted abilities should seriously advocate front driving for high-speed motor-carriages, and also the often-tried device of making all four wheels steer as a preventative for side slip and skidding, etc. While granting these advantages to be secured, surely Mr. Sennett knows the price that must be paid for them. Not to unduly trespass on your valuable space, and to take the matter very briefly, let us look at both questions seriatim.

Firstly, front driving is a favourite scheme with many motor builders, and has been from the days of Cugnot, but if Mr. Sennett will turn up his automotor history he will find none of the many motor-vehicles from time to time built of this type have ever shown any particular turn for speed, one reason being that sufficient weight could not be placed on the driving wheels without seriously affecting the steering; where the drivers were also the steerers, and where the rear wheels were employed to steer, the handling of the carriage was rendered very troublesome, and in a large and heavy car well nigh impossible. It is perhaps hardly fair to compare locomotive practice with that of the road, conditions being so dissimilar, but surely it is a fact worth more than passing notice that in all fast running engines the bogie invariably is a *leading* one. (I am not saying that no front-driving locomotives exist, or are incapable of fast work, be it understood, but merely that the fastest are as I have stated.)

However, this is by the way—and to take the next point. Secondly, if all four wheels steer, how will Mr. Sennett get his power to the wheels? Frankly, I fail to see how without complications of universal joints and bevel gear, with their accompanying costly fitting and excessive wear. Granting it *can* be done with an electrically-driven car, I think it will be agreed that the electric car has to make a great many strides in improvement before it will be capable of taking a long and sustained journey. With any other power (admitting electricity to be put out of court), whatever sort of appearance would the under side of a car present with Mr. Sennett's device! I dimly picture a maze of driving chains, swivels, universal joints, and levers, with a blue haze of petrol and bad language as an accompaniment. Let us cast a veil over the painful subject.

Speaking in all seriousness, I really think Mr. Sennett cannot have taken all points into consideration, for, taking the steering difficulty alone, he will see for a really high speed he must adopt the Ackermann form of steering axle, and a moment's thought will convince him that either four universal joints or four sets of mitre wheels will be wanted to convey the power to the wheels. Now, putting aside the mitre wheels, which, as is well known to engineers, should be avoided wherever possible, let us but look at the universal joints. With the usual form it is admitted that beyond an angle of fifteen degrees the motion is sensibly irregular with accompanying friction. Should we dispose of this by the use of a special form of joint (like the clever arrangement of Messrs. Sydenham and Watkinson) how will this work in clouds of dust and showers of road grit? The cost will be enormous, and I fear Mr. Sennett will find his advantages can be too dearly bought.

I trust he will not feel annoyed by my briefly stating these facts, which I submit as not only my opinion, but as amply borne out by actual practice.—Yours faithfully,

SIDNEY RUSSELL.

THE CROWDEN STEAM MOTOR FIRE-ENGINE.

MR. C. T. CROWDEN, of the Motor Works, Leamington, who was prominently associated with the design and manufacture of fire-engines some years prior to his connection with the motor industry, has recently produced a motor fire-engine. The engine, which has been converted, belongs to the Norwich Union Fire Insurance Company. It is stationed

FIG. 1.—GENERAL VIEW.

at Worcester, and during the process of conversion has never been out of regular use, but has attended several fires while the alterations to it have been in progress. The original road wheels were far too light for automobile purposes, and a new set of wheels was constructed under Mr. Crowden's patents, by which the spokes are set back at the hub, thereby ensuring safety against the great lateral strains to which motor-wheels are subjected. The hind or driving wheels are fitted with star wheels and sprockets. Differential shaft and gearing is hung to the main frame, in front of the brake shaft, by two special brackets, and fixed by two bolts, these bolt holes being practically the only fresh holes made in the existing frame. A motion frame for carrying the crank shaft is attached to and can be removed from these brackets when required. Each end of

FIG. 2.—SECTIONAL ELEVATION.

the differential shaft is fitted with a sprocket pinion, and connected up to the hind wheels by means of a chain, which is adjusted by two setting-up radial stays. To this frame is attached an independent double-cylinder horizontal engine fitted with link motion, driving a double-throw crank shaft, to one end of which is fitted a pinion driving the differential gear shaft. Steam is taken to the propelling engine from the main steam pipe feeding the fire-engine, and the exhaust is taken into the existing fire-engine exhaust pipe. The old hose-box has been re-

moved and a water-tank substituted, having a seat for three men to sit abreast, and a fireman sits on the top of the water-tank with footboards as before. The centre man or driver has full control and manipulation of the engine from his seat. An extra screw brake is provided as an emergency brake, which can be operated from behind by the stoker. The coal bunkers have been altered to give a larger capacity, and a seat is fitted for the stoker for firing *en route*. The boiler is provided with a detachable ashpan for preventing the hot cinders falling upon the road. The original fore-carriage is used, a channel steel sector being fitted to the splinter bar by two stanchions, and a chain pinion attached to the vertical shaft gearing into a length of pitch chain fixed in the channel to serve the purpose of a rack. Should the motor part of the engine become disabled the motor engine and gearing can be easily removed by withdrawing a few bolts, and the engine used as a horse-drawn vehicle. A boiler feed-pump has been attached, worked from the counter-shaft, also a special apparatus for filling the water-tank from the river or roadside streams and other sources. The motor engine has proved itself very satisfactory up to the present; it will run on the level road at a speed of about twelve miles an hour, and will climb all the hills that have so far been met with, some grades of which are very severe in this district. It is stated that a very great saving will be effected by its use in Worcester, the horsing of the engine previously costing a guinea a mile, and the work being so severe that no one cared about lending their horses for the fire-engine, which weighed about three tons when loaded with all its appliances and firemen. The motor, after lighting the fire, can be got away in about five minutes under its own steam. Mr. Crowden believes this to be the first practical steam motor fire-engine yet constructed in this country in which separate propelling engines are fitted with expansion and reversing gear wholly controlled from the driver's seat.

THE Reading Automobile Club will hold its annual non stop run to day (Saturday). The destination is Oxford, and each competing car will be required to either carry an observer or to keep within sight of the judge's car.

MOTORISTS passing through Gravesend can now have their requirements met by the Clarendon Motor Company, at the Clarendon Hotel, the concern now stocking petrol, grease, etc. They have also opened a *garage*, and have an inspection pit and other conveniences. Benz and Daimler cars are also kept on hand for hire.

It will come as a surprise to many to learn that Mr. E. J. Coles, so long connected with Messrs. Hewetsons, Ltd., has severed his connection with that company and is entering the automobile trade on his own account. Mr. Coles, who is at present located at Criterion Buildings, Upper Holloway, N., where motor repairs of all kinds can be carried out, will shortly open a depot in the West End, where a large stock of new cars will be carried.

A COMPANY has been formed, to be known as the London Distributing Kitchens, Ltd., "to supply complete meals of all kinds, including wines, spirits and beer, and all table fittings and requisites, to persons at their own residences, chambers, or offices in London, and within a five-mile radius from Charing Cross." A feature of interest from an automobile point of view is that it is proposed to deliver the meals in specially constructed motor-vans, an illustration of which is given in the prospectus which has been sent out this week.

ON Thursday last the Motor Manufacturing Company, Ltd., organised a Press visit to their works at Coventry, when the visitors were entertained at lunch, and afterwards driven on motor-cars to Northampton. The directors of the company wish to remove from the minds of many pressmen the idea that the motor-cars produced in this country are not equal to those manufactured on the Continent, and in order to demonstrate that this is not universally correct, the trip to the company's works and the subsequent run on English cars was arranged.

HERE AND THERE.

THE usual quarterly 100-Mile Non-Stop Trial organised by the Automobile Club is fixed for Tuesday next, July 2nd.

DIEPPE is organising a fête for the 6th, 7th, and 8th of July, in which the motor-car is to play a prominent part. The Dieppois hope to eclipse anything of the sort ever seen before.

THE members of the Automobile Club held a pleasant run to Henley on Saturday last, the route followed being via Hammersmith, Gunnersbury, Brentford, Colnbrook, and Maidenhead. Dinner was taken at the Red Lion Hotel.

ON Thursday next, in connection with the bankruptcy of Messrs. Pennington and Baines, Messrs. Norman and Bowen will put up for sale, at Lamb's Conduit Street, London, W.C., "a valuable 36 h.p. high-speed Pennington motor-car."

MR. C. ARTHUR PEARSON is reported by the *Motor World* to have gone to America in a search for an automobile capable of travelling a hundred miles an hour—a rather appropriate rumour in connection with the editor of the *Express*.

THE Motor Trust Limited, has been registered with a capital of £3,000 to adopt an agreement, made June 12, with G. F. Milnes and Company, Ltd., and to carry on the business of manufacturers of and dealers in motors and other carriages, mechanical engineers, etc.

MR. L. T. GRANT, manager of the Honolulu Automobile Company, has arrived in San Francisco on his way East to buy supplies for his company, which started a public motor-car service in Honolulu about three months ago. Twenty-three vehicles were put on the streets, and have been very popular.

Automobile Topics states that Mr. C. J. Field, of the Automobile Club of America, is in receipt of a letter from Mr. S. F. Edge, of London to the effect that the latter expects to take part in the American sweepstakes over the Buffalo-Erie course with the 70 h.p. Napier car.

ELSEWHERE in the present issue we give an illustration of M. Louis Renault on the car which came in first in the voiturette class in the recent Paris-Bordeaux race, his time for the 327 miles being 9 hr. 32 min. The performances of the Renault cars formed one of the features of the race. Four vehicles started, and notwithstanding the long journey, they arrived safely at Bordeaux all within half an hour. The Roadway Auto-Car Company, Limited, are the agents for the Renault cars in this country.

THE Charron Automobile Company of America is reported to be in progress of organisation in New York. M. Charron, the well-known automobile racing man of Paris, is personally interested in the venture. The sale of Panhard and Mors vehicles, and later the manufacture of the same in the United States, constitute the scope of the new company's operations.

THE case in which Mr. L. A. Legros was fined by the Chertsey magistrates forty shillings for driving a tricycle and trailer at more than six miles an hour, was considered at a recent meeting of the Standing Committee of the Automobile Club. It was directed that Mr. Legros should be informed that he should proceed with the appeal, and that the Committee have voted ten guineas towards the expenses of the appeal; it is further proposed to invite firms who are interested in the manufacture of tricycles and trailers to contribute towards the cost of appealing.

AT the Royal Agricultural Society's Show, which is being held at Cardiff this week, the Mann Steam Cart and Wagon Company, Limited, Leeds, have on view one of their steam lorries and also one of their steam tipping carts. The Yorkshire Steam Motor Company, Limited, of Leeds, show a steam wagon to carry three to four tons, while the exhibit of Mr. J. Scott, of Duddingston, Edinburgh, consists of a self-propelling cultivating machine of 20 h.p. Several motor-cars are also to be seen, the Lanchester Engine Company, of Birmingham, being present with one of their four-seated motor phaetons, and Messrs. Marshall and Co., of Manchester, with a couple of vehicles—a 8 h.p. tonneau and a 4½ h.p. voiturette.

FURIOUS DRIVING CASES.

AT the Shire Hall, Nottingham, George Hunt, cycle agent, of West Bridgford, was charged with driving a motor-car at a speed greater than twelve miles an hour. There were further charges against the defendant of driving the car at a greater speed than was reasonable and proper, having regard to the traffic on the highway, and of not stopping at the request of a person in charge of a restive horse. Mr. H. P. Day, for the defendant, did not call any evidence, but addressed the bench. He emphasized the desirability of nothing being done to discourage the motor-car industry, and contended that the case had been exaggerated. There was a prejudice against motor-cars at the present time, which, he hoped, would die out, and a driver of a motor-car was at the mercy of any person who might vindictively or otherwise request him to stop. The Bench retired to deliberate, and upon returning into court, the Chairman said they considered the case a serious one, and to mark their sense of it they would fine the defendant £5 for driving at a greater speed than was reasonable, and £5 for not stopping when requested.

AT the Spilsby Petty Sessions, Charles Holland, motor-car proprietor, Boston, and Robert C. Holland, his son, were charged with furiously driving a motor-car to the danger of the public at Carrington, on the 1st inst. Mr. C. Nelson defended, Mr. Wm. H. Ward, J.P., landowner, Carrington, said that at 8 p.m. on the day in question he was driving from Boston, and upon approaching his home in Carrington he met two motor-cars coming in the direction from Revesby. In his opinion they were driving furiously and were greatly in excess of the speed limit. He had some trouble with his horse, and the driver of the car assisted him. In defence, Mr. Nelson said the charge was for furious riding, and to the serious danger of the public. There was no evidence to prove that defendants were travelling to the danger of the public at all. After hearing the evidence of several witnesses the Bench retired, and upon their return, the Chairman said there had been a great deal of conflicting evidence, all of which had been carefully weighed, and they had found the weight against the defendants, therefore they convicted. Each defendant would be fined 50s., with £2 13s. 9d. costs, making a total of £10 7s. 6d.

AT Downham, John Roethlin, of Cockley Cley, motor-car driver to Earl Wilton, was summoned by Sergeant Starke for driving at a greater speed than twelve miles an hour at Stoke Ferry on the 25th ult., and was fined £2 and 32s. 6d. costs.

AT Birkenhead, Theophilus Fritson, a German, was summoned for driving a motor-car furiously on Saturday, the 8th, on the Chester road. The police evidence was that the defendant was going at the rate of 28½ miles an hour round a corner at Eastham. Several police officers had been stationed with stop watches on the road, and, having measured certain lengths and timed the car passing, they claimed to be able to give the exact speed at which it was driven. Mr. Steinforth defended, and said defendant asserted that he was not driving the car at anything like that speed, and, in fact, some of the driving gear was out of order, and it took him 2½ hours to get from Birkenhead to Eastham. A fine of 40s. and costs was imposed, the magistrates declaring that they were not moved by the particular rate of speed, but by the belief that defendant had driven round the corner at a speed dangerous to the public.

AT Chertsey, Claude Lorraine Barrow, of London, was summoned for driving a motor-car at a rate of over twelve miles an hour, at Weybridge, on June 9th. P.C. Bettison said that the defendant was going at the rate of eighteen miles an hour. He told witness that he had recently come from France, where they were allowed to go at what pace they liked. The defendant, through his solicitor, urged that he was quite ignorant of the law, having only been in England a short time. The pace at which he travelled was sixteen miles an hour.—Fined 30s.

AT Steyning, Samuel Aldin Smith and Robert Crawshaw were summoned for driving motor-cars at an improper speed. A letter was received from the solicitor for Crawshaw stating that his client had to answer a like summons at Haywards Heath on that day, and the Magistrates therefore agreed to adjourn the case for a week. In respect to Smith, a letter stated that he was touring in the South of England, and asked for a three weeks' adjournment. It further stated that the summons would be sent on to him. Superintendent Hooker said the summons had been served on him personally by the Metropolitan police. The case was adjourned for a month, the Magistrates ordering Smith to pay the day's costs.

AT Woburn, R. S. Sievier, of Toddington, was charged with being the person in charge of a motor-car on the highway at Hockliffe, on May 15th, driving the same at a greater speed than twelve miles an hour. Also at the same time and place, with driving the said motor-car at a speed greater than was reasonable and proper, having regard to the traffic on such highway. Mr. W. W. Marks, of the County Council, appeared to prosecute, and defendant was represented by Mr. Austin, of Luton. P.C. Underwood, of Hockliffe, stated that he was standing opposite the Leighton Road, when he saw the car coming from the direction of Dunstable at a furious pace, forty miles an hour he should say. Cross-examined: He knew Mr. Sievier, but could not say who was the man who was driving. The car was going too fast for him to time it. There were four persons in the car, and no other vehicle on the road at the time. Wm. Grieg, of Luton, said the car went so fast that he could not recognise the occupants. Other witnesses having been called, Mr. Austin, after apologising to the Bench for his client's non-appearance, urged that it was

singular that only one of the witnesses had sworn that it was Mr. Sievier at all. He submitted that the wrong man had been summoned. His client was only in the car and was not driving it. The man whose hand was on the lever was the responsible person, and it was the driver who should have been summoned. The statements of the witnesses as to speed he described as gross exaggerations. Mr. Marks, referring to summoning the wrong man, said he had never heard such a preposterous argument as that urged by his friend. In the same way as a licensee was held responsible for the acts of his barman, so was Mr. Sievier liable for the act of the driver. Mr. Sievier was the true defendant, and was in charge of, and driving by the hand of, his paid servant. As to the twelve mile regulation, it was in force up to now. The Bench convicted, and imposed a fine of £5, with £3 14s. 6d. costs. The second charge was withdrawn.

At Consett Petty Sessions, William Dunn, of Newcastle, was summoned for driving a motor-car at a furious rate. Inspector F. Best, of Consett, deposed that on the evening of the 6th inst. he was on duty at Ebchester, when he saw the defendant, who was on a motor-car along with two other gentlemen and a lady, travelling from Shotley Bridge towards Newcastle. He passed through the village at a speed of fully twenty miles an hour. Defendant never blew his horn or attempted to apply the brake on descending the hill. There were three little girls about to cross the road at the time, and witness had to stop them. The car raised such a cloud of dust that the officer, who had his bicycle, could not follow the defendant. Defendant: How do you judge that I was going at twenty miles an hour? Inspector Best: To my mind you went through the village like an express train. P.C. Johnson, in his evidence, was inclined to agree with the inspector that the car was travelling more than twenty miles an hour. Defendant stated that the only way of gauging the speed was by means of a stop watch. He had travelled between 15,000 and 20,000 miles on his car, and employed a young man who had driven a car through Fleet Street and the Strand, London. The reason he was going so fast was that there was an officer on the car who wanted to get to the Tyne to board his vessel. The Magistrates told the defendant that he ought to regulate his car to the places he was travelling through. He should not pass through any village, to the danger of the lives of pedestrians, even at the rate of twelve miles an hour. The case would be dismissed on payment of the costs, and the defendant contributing one guinea to the poor box.

At Haywards Heath, Robert T. Crawshaw, of London and Brighton, was summoned for driving a motor-car at a greater speed than twelve miles an hour, and also for refusing to stop the same when called upon to do so by the person in charge of a certain animal. Mr. J. Norris stated that he was driving with Mrs. Norris on the London road at Bolney, on June 7th, about 4.45 p.m., when by the Bolney cross-roads he saw a motor-car coming down the hill. There were two men in the car, which was travelling at twenty miles an hour. Witness held up his whip to stop the motor, and shouted to the man in the car. The mule swerved from one side to the other, then turned sharp round, and the motor ran into the mule. The motor went off into the ditch, and ran along it some twenty yards. The motor broke the wheel, shafts, and the whole of the front part of the pony cart. Mrs. Norris having corroborated the evidence of her husband, and other witnesses having been called, Mr. Staplee Firth called Harry Lee, of London, motor machinist, who said he was driving a motor with defendant on the London road. It was geared to about ten miles an hour, and that was the speed they were going down Bolney hill. Both brakes were on. He saw the mule about a hundred yards off, when it was on its own side, and he saw a clergyman on the road. Mr. Norris did not put up his hand or whip. They slowed down to eight miles on passing the mule. When a few yards off, the mule turned his head to the ditch, and backed the front wheels right across the road. Defendant tried to dodge the mule, and steered into the ditch. But for the cautious handling of the car by defendant a serious accident would have happened, as they would have struck the middle of the cart. Mr. Firth, addressing the Bench, contended that no expert evidence had been given as to the speed, except by his own witness, who put the speed at ten or ten and a-half miles an hour. Had defendant driven into the ditch at the speed alleged, the motor must have gone over, and possibly killed defendant. He contended that the accident had been introduced into the case with the view of assisting a subsequent claim for damages, and someone had interfered in the case with dramatic effect, who had no right to interrupt him. The Magistrates retired, and, on coming into court again, the chairman said they were of opinion that both cases had been proved, and defendant would be fined 40s. in each case and costs, £1 4s.

REINHARDT v. THE SPEEDWELL MOTOR-CAR COMPANY.

At the Berks Assizes last week the action Reinhardt v. The Speedwell Motor-Car Company was heard before Mr. Justice Day. Plaintiff, Dr. Charles Reinhardt, a medical gentleman residing at Willow-side, Goring, has a sanatorium for consumption under the new open-air treatment, at Hales, about 400 ft. above Goring, on the Oxfordshire hills. The action was brought for breach of express warranty. The defendants (Messrs. Dew) carry on the business of motor-car and cycle vendors, in Broad Street, Reading. The warranty alleged was that the motor-car, for

which Dr. Reinhardt gave a new £70 Beeston quadricycle and a cheque for £30, was a good hill climber. On the case having been opened, Mr. Amphlett said the motor-car was outside the court, and could be tested in any way. Plaintiff said he purchased a Beeston quadricycle, which he eventually exchanged for a motor-car, which was supplied to him by Messrs. Dew, and which was warranted to him as an excellent hill climber. He relied on the statement made to him by one of the Messrs. Dew, and purchased the car accordingly. It failed to act as represented, and consequently he invited Mr. Dew to journey with him on the following Monday—the car was purchased on the Saturday—and he did so. They reached the foot of Caversham Hill all right. Then the car refused to budge, and he and Mr. Dew got out and pushed it up the hill. The plaintiff gave further evidence, all of which tended to show that the car would not mount the slightest incline without being pushed. After certain negotiations with Messrs. Dew they offered to sell the car for him, but plaintiff failed to get his money refunded. He then offered to take £75 out in bicycles, and to lose the £30 which he had paid to the defendants. This was refused. He did not receive a written warranty. Several witnesses were called, each of whom spoke to the fact that they saw the car, and that it would not go. Mr. Amphlett, for the defence, said his client's case was that a machine of the class in question was not designed for the purpose of going up hills such as Caversham Hill. The machine, if driven properly, would go perfectly well, but the plaintiff was not able to drive it properly. The defendants never gave a warranty that it would go up Caversham Hill. Dr. Truman and Mr. Alfred John Dew were the principal witnesses for the defence, and each denied that when the conversation took place at the defendants' shop as to the purchase of the machine anything was said about its being capable of climbing Caversham Hill. Mr. Dew declared that the plaintiff said he wanted the car for a good level road. Other evidence was given, and in the result his Lordship gave judgment for the amount claimed—£100—and costs.

AUTOMOBILE CLUB HILL-CLIMBING TRIAL.

The Committee of the Automobile Club ask us to announce that on Saturday, 6th July, there will be held, under the direction of the Club, a Hill-Climbing Trial, open to all comers, whether they be members of the Club or not. No entrance fee will be charged, it being the desire of the Automobile Club Committee that on this occasion there should be nothing to stand in the way of any owner ascertaining, under official auspices, the hill-climbing capacity of his car. Competitors who are not yet registered under the Competition Rules of the A.C.G.B.I. will be required to fill in a form of registration either before or at the start, but no fee will be charged. The competition will be held at Dashwood Hill, four miles beyond High Wycombe, 33rd milestone from the Marble Arch.

It is requested that vehicles will drive carefully and at moderate speed on the route to and from Dashwood Hill, and will travel slowly in passing through Southall, Hillingdon, Uxbridge, Beaconsfield, and High Wycombe. Members of the Club are invited to meet at the Club at 2 o'clock. The competition will start at 5 p.m. Any vehicle the driver of which has not reported himself to the Club steward at the Dashwood Arms Inn, at the foot of the Hill, and there obtained his number by 5.30 p.m., will be disqualified. Each vehicle will be required to ascend and descend three times. Vehicles must carry their full complement of passengers, weighing on an average not less than 10½ st. each.

The following particulars must be in the hands of the Club Secretary at 4, Whitehall Court, London, S.W., not later than twelve noon on the day of the competition. (a) Name and address of owner. (b) Name and address of driver. (c) Number of seats for passengers, including driver. (d) Name of manufacturer of car. (e) Name of manufacturer of engine. (f) Fuel. (g) Reputed brake horse-power of engine. (h) Number of cylinders. (j) Price (viz.: the price at present asked by the manufacturer for the car with body, etc.)

The Trial Rules Committee will probably announce the results by means of marks, in the calculation of which speed, price, and number of passengers will be the principal factors.

NO LIGHT.

At Richmond (Surrey), Walter MacCormack, of Regent's Park, was summoned for driving a motor-car and failing to have visible the necessary red light required by the law to be visible after sunset. Station-sergeant Shepherd stated that at 10 p.m. on the 4th inst. he saw the defendant driving a motor-car at Castlenau, Barnes. Witness shouted to him, but defendant refused to stop, and he was ultimately overtaken at the "Red Lion," Barnes, where he had pulled up. There were two lamps in front with red glass at the back of them, but as they were in front of the splash-board the light could not be seen from behind. The Chairman said that the penalty for the offence was £10, but as the defendant had a lamp, although it was not in the right place, he would have to pay a fine of £2 and costs.

AMONGST the names of the new members of the French Automobile Club elected at the last meeting we notice that of Mr. Harvey du Cros.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, JULY 6, 1901.

[No. 122.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

KING EDWARD is taking to the motor-car as a means of rapid conveyance in a way which must have a considerable influence on the adoption of the automobile in society circles. On Friday of last week he ran down to Hampton Court *en automobile*, while on Tuesday he journeyed from London to Windsor and back on his new 12 h.p. Daimler car. His Majesty was attended by Major-General Sir Arthur Ellis and Captain Holford. He left Marlborough House at eleven o'clock in the morning, and reached Windsor at a quarter to one. A crowd witnessed the departure, and great interest was taken in His Majesty's vehicle. In spite of the heavy rain, a crowd waited on Thames Street Hill, Windsor, from eleven o'clock till nearly one. They were doomed to disappointment, for shortly before one o'clock the statement was made that his Majesty had arrived safely at the Castle, and that he had entered the royal grounds by a private way. The return journey was also accomplished in wet weather. His Majesty was expected at Marlborough House at about half-past five o'clock, and at that hour a small crowd had gathered opposite the principal entrance. It was, however, five minutes past seven o'clock when the car arrived. It ran swiftly through Marlborough Gate, gracefully swept round the corner, and entered the grounds almost unnoticed.

Motor-Cars in Parliament.

In the House of Commons a few nights ago, Mr. Chaplin asked the President of the Local Government Board whether his attention had been called to the rapid and recent development of motor-car traffic in the United Kingdom, the increased and increasing power of these vehicles, the speed at which many of them were habitually driven, and the serious accidents which had recently occurred, and whether the Government would reconsider the Act of Parliament controlling them as well as the advisability of requiring some test or certificate of efficiency from persons desiring to drive motor-cars before they are permitted to do so. Mr. Long replied that he was carefully considering all the representations made to him on the subject, but that, so far as he could learn, the drivers are usually skilful, but he regretted to say that the pace very often considerably exceeds that allowed by law. Therefore, the alterations suggested would hardly seem to meet the case. Now, what are these dangers we hear so much vague talk about? Mr. Chaplin probably had in his mind the unfortunate Chiswick fatality, which would have occurred just as surely had Mr. Scarisbrick been driving a horse, but under such circumstances no one would have heard anything about it. It seems to us that the danger to the public, which the law should stop, is the depositing of passengers from buses and trams in the centre of crowded thoroughfares.

Another Question in the House.

THE question of the speed of motor-cars again cropped up in the House on Tuesday, when Mr. Muntz asked if the First Commissioner of Works was aware that motor-cars were being run at a speed of forty miles an hour across the entrances by which equestrians enter the public parks. The reply to the question was that the pace of motor-cars is regulated by the general law and by the Parks Regulations Act, the Metropolitan Police being responsible for law and order in Hyde Park, and having the same powers to control traffic in the Park as outside.

From Nursery to Covent Garden Market.

THE trial at Liverpool of motor-cars suitable for heavy haulage is quickly bearing fruit (literally) to Covent Garden. Mr. H. Seal, of the Albany Nurseries, Enfield Highway, who, at the termination of the Liverpool trials, purchased of Messrs. Milnes the lorry which gained for them first prize and gold medal, has had the distinction of being the first to adopt motor transit of produce from his nursery to Covent Garden. On inquiring as to the success of the experiment, Mr. Seal informs us he is more than satisfied; his motor-lorry conveys two and a-half tons of tomatoes sixteen miles twice daily at a cost for fuel of 1s. 6d. each journey, performing with ease the work for which six horses would have to be kept, half the time only being occupied in transit. The publication of his experience will doubtless cause many to follow his example—already a second Milnes' motor-lorry has arrived at Covent Garden with produce from a Kent nursery.

Educating the Press.

IN spite of the Cockerton Judgment free education is booming as far as the motor-car is concerned. County Councilors and Municipal Engineers have been put through their paces, and now the Press has been afforded an opportunity of learning a few of the characteristics of the much misunderstood motor-car. A hundred members of this vast and influential body were, on Thursday last week, the guests of the Motor Manufacturing Company. After inspecting the works at Coventry they were conveyed by motor-cars to Northampton, the intervening thirty-four miles being covered in a little over two hours without accident to passenger or other wayfarer. A short adjournment was there made at the Peacock Hotel, after which the party departed for town by special train, favourably impressed and ready to start upon the Herculean task of leavening that mass of ignorance that clogs the wheels of the motor-car.

The Association of Municipal and County Engineers.

IN the course of his presidential address, at the Conference of the Association of Municipal and County Engineers, at Leicester, last week, Mr. E. G. Mawbey, M.Inst.C.E., remarked that there is a great future for the motor-car for light work and swift and convenient transit, and this will gradually

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

effect a great sanitary improvement and considerably diminish the wear and tear of our roads and streets. In his opinion, however, the motor-car is not likely to supersede electric traction for public service. Referring to heavy traction, Mr. Mawbey remarked that with heavy steam road locomotives the hauling of loads of from fifteen to thirty tons can be done at an extremely low cost per ton mile; but the new Locomotives on Highways Act, 1896, has produced a smaller and handier means of doing the work of several horses at an inclusive cost of less than 4d. per ton per mile. These light locomotives are not likely to increase the cost of upkeep of the roads, for with horse-haulage the deteriorating action of the hoofs must be taken into consideration. The present use of horseflesh for heavy loads, especially on steep gradients, is hardly worthy of science.

An M.P. on Motor-Cars.

"WHAT the stage coach did for inns and villages in the old days the motor-car is going to do for inns and villages in our time; the problem of 'back to the land' will find a solution in the use of the automobile. More traffic along the shady country roads to lovely rustic places; more opportunities of employment for young villagers—a call for inn-servants, cooks, stablemen, machinists; more local demand for meat and vegetables and fruit and milk and butter; more interest and excitement in village life, the throb of town activity in the hamlets: these are the changes which will follow in the wake of the magic motor-car." Such is the common-sense view of the new order of things set forth in an able and interesting article from the pen of Mr. J. H. Yoxall, M.P., which appeared in the *Daily Mail* the other day.

On the Bath Road.

ATTIRED as ordinary, commonplace, friendly cyclists a number of name-taking police are said to be frequenting the Bath road to waylay motorists. We hear that this procedure has been adopted at the instigation of some local J.P.s, and that the name of Mr. Arthur Balfour is among those jotted down in the policeman's note book. Surely, however, this is hardly sufficient. Why do the police stop at that? Why not incite the motorists to speed races and then arrest them? They would be a little more certain of obtaining victims, and the method would be only a little more un-English.

Road Improvement Association.

At the last Council meeting of the Roads Improvement Association, it was resolved, on the motion of the Hon. J. Scott-Montagu, M.P., to move certain amendments to the Light Railway Bill now before the House of Commons, with a view to more adequately protecting the interests of the general body of road users. The report of the Royal Commission on Local Taxation was considered, and the following resolution unanimously adopted:—"That the Council of the Roads Improvement Association cordially approves of the recommendations of the Royal Commission on Local Taxation, that one-half of the cost of main roads in England and Wales shall be borne by the State, provided that the Imperial grant shall be made dependent on compliance with conditions designed to secure efficiency, and trusts that His Majesty's Government will give effect to the recommendation at an early date."

A County Councillor's Trip.

THE Hereford County Council has decided to support the suggestions of the Berkshire Council with regard to the numbering of motor-cars—a decision which has called forth some strong protests. Mr. J. F. Symonds, of Hereford, a County Councillor, and was present at the Automobile Club's demonstration, being a passenger with Colonel Kerrison, of East Suffolk, on Mr. H. Edmunds' car. His account of the trip is interesting. "Choosing," he writes, "Buckingham Palace and the Park, away we went, passing the Horse Guards, to Westminster,

Bird Cage Walk, the Palace and Green Park, thence over Battersea Bridge, through the beautiful park, Wandsworth, Wimbledon Common, and at such a pace, slowing down at every 'bus or cab or carriage and pair that obtruded on our path, alarming neither horse nor man, save two. There was no smell, no discomforting vibration, no noise, and the ease with which we dodged in and out the close heavy traffic through Wandsworth and most crowded districts, and every clear space of 100 yards or so in front, dashing along at thirty miles an hour—on the open commons probably still faster—was a marvel to me, and has made a lasting impression."

On His Majesty's Service.

MR. FRANK MORRISS, of the Motor Works, Lynn, has had a glorious opportunity of defying law and order, as understood by the twelve-mile limit, with impunity. At 5.30 p.m. one day last week, he received an urgent message from the Commanding Officer of Coastguards asking for a car to be sent out to Middleton at once to land him at a certain Lincolnshire Coastguard station (seventy miles distant from Lynn) before sunset, on urgent and pressing official business. Mr. Morris left his depot just before 6.0 p.m., took the Commander aboard at Middleton and landed him at his out-of-the-way and distant station about 9.30 p.m. Needless to say that in this case, Mr. Morris, being on His Majesty's service, did not keep within the limit. On the following day Mr. Morris conveyed Admiral Noel on official business to some remote stations on the Lincolnshire coast. The Admiral expressed the greatest satisfaction and surprise at the speed of the car and the absolute and easy manner in which Mr. Morris controlled it.

Moustaches for Motor Men.

THE importance of the motor-car industry in France may be gauged by the fact that professional drivers have already formed a union and are on the verge of their first strike. A certain large company which hires out cars has ordered the instant shaving-off of all moustaches worn by its drivers. Amongst the employees indignation is at boiling point. The council of the union has called a meeting of protest, its members have sworn to stand firm, and the national Press is being urged to throw its weight on the side of liberty. *Vivent les moustaches!* is the war cry of the oppressed.

More Municipal Motor Dust-carts.

WELLINGBOROUGH is keeping pace with the times. So far, the house refuse has been collected from the streets by a contractor, but at a meeting of the Urban Council held last week it was decided to replace the carts with a motor-car. The Urban District Council of Acton have also arrived at a similar decision and are inviting tenders, until the 9th inst., for the supply of a motor dust-van.

Another Conspiracy Exposed.

As will be seen from the special report in another column, the indefatigable Mr. Staplee Firth has again been successful in obtaining a practical condemnation of the use of underhand methods by the police authorities, this time from the Portsmouth Bench. The adoption of such means of obtaining convictions has recently shown signs of assuming the dimensions of an organised crusade, and the more such salutary checks to what he euphemistically described as "over-zeal" can be inflicted, the better for the interests of justice and automobilism. To set a detective with instructions to catch "scorchers" has evidently all the effect of what a psychologist would call "suggestion" (unless he were hopelessly frivolous he would not add "auto suggestion") and renders the personal equation in police evidence unusually difficult to correct. How long will it be, we wonder, before our legislators will realise that "the longest way round"

is by no means always "the shortest way home," and that a simple provision against driving to the common danger, applied impartially to all classes of traffic, even including butchers' carts, electric trams, and untrained horses, might well take the place of selective legislation and split-second chronographs served out to the police?

Chefs and Chauffeurs.

A NEW sphere of utility for the automobile appears in its proposed employment for the house-to-house distribution of luncheons, dinners, etc. The pioneer company which started this scheme with older methods of locomotion finding the demand sufficient to warrant its extension, proposes to adopt specially-arranged motor-vans, with non-conducting compartments for preserving the dishes, ices, etc., at their due extremes of temperature for a couple of hours. Of course the catering for a town area is all that has been in practice or in contemplation, but the new departure should make similar enterprises feasible in country districts, where the additional acuteness of the domestic question would be all in favour of the success of such a scheme, which even seems to hint at the motor-propelled housemaid and automobile shoeblick. If the culinary and motor experts employed are of equal ability there is an evident future before it, and expectant diners will attach a new importance to the "pip-pip" of the horn when it heralds the approach of the "chef-chauffeur's" car.

A Scarborough View.

SCORES of leading articles on the recent motor-car race have appeared in English papers, and one of the most sensible appeared in the *Scarborough Post*, which said:—"We need not be sorry that the Continent is allowing experiments of this character. The motor-car has come to stay, though the vehicle of the year 1921 will probably be as different from that which we see on the road to-day as is the pneumatic-tired bicycle, with which we are familiar, from the bone-shaker of our boyhood days. But it is only through experiments and failures that we shall reach perfection, and even those of us who have no desire to see racing of the Continental character recognise the necessity for allowing reasonable latitude to the autocar in its experimental stage. We shall be surprised if, before this year is out, there are not seen in Scarborough and district cars of a character which will demonstrate the progress which the science of motoring is making."

How an American Advertises.

We have received from America particulars of a scheme—novel, to say the least of it—for advertising motor-cars. Our ingenious American correspondent proposes to organise a party of motorists to make the tour of the fairs for a racing competition. He purposes getting a dozen different makers to enter a vehicle and driver, he himself bearing the whole of the expenses on tour. On the morning of the day of a race, the motorists will parade through the streets to attract attention. In the meantime the great motor-car race for 5,000 dollar purses will have been advertised by the fair people, who are to bear all expenses, and in addition to give the manager one hundred dollars for himself. But there the novelty ends, for the so-called 5,000 dollar purses will contain valueless paper.

A Warning.

WHILE anxious to see the fullest and freest possible development of motoring in this country, we have never disguised our regret that there are a few motorists as frail as other members of the public. The Automobile Club, too, has deprecated the action of those who have gone beyond reasonable rates of speed, and thus brought odium upon all concerned with the progress of the motor-car. We hear that owing to the conduct of a driver of a motor-car passing over the Duke of Portland's

estate recently his Grace has instructed his agent not to allow automobiles on any of the private drives at Welbeck nor in his part of Sherwood Forest. The Duke has hitherto been tolerant and sympathetic in his attitude towards automobilists. He did much to add to the interest of the last few days of the 1,000-mile Trial, and has given facilities for motorists to see the beautiful country in his possession. But, just as there are black sheep in every flock, so there are an insignificant minority of motorists to whom manners are unknown. In common with all automobilists we deplore the step which the Duke has taken; and we have nothing but blame to heap upon the heads of those who cannot recognise the obedience to rules and regulations which all good sportsmen maintain.

A WEDDING PARTY AT SOHAM, CAMBRIDGE.

Limiting the Weight of Racers.

THE Sporting Committee of the French Automobile Club has fixed the weight of future racing vehicles at 1,000 kilog. (2,200 lbs.). The new rule will come into force on the 1st January, 1902, but will not be obligatory on the part of other race organising bodies until the beginning of 1903. Already the Pau Automobile Club has adopted the new rule with regard to its meeting in February next, and the Automobile Club de Nice has done the same with regard to next year's Nice week.

Liquid Air and Motor-Cars.

LIQUID air, which of late has been strongly urged as a source of power for motor-cars, probably has much less of promise than its promoters believe, or at least assert. It stores comparatively little energy, is enormously costly, especially as a competitor in energy-storage with fluids of little or no cost, requires very large quantities per horse-power delivered, and no known way exists for its storage for any considerable or satisfactory period without immense waste. According to Linde, perhaps its most successful, experienced, and reliable producer, it requires a 100 h.p. at the compressor to produce as many pounds per hour, and it can develop but a fraction, probably a small fraction, of that amount of power in regasifying. It loses by simple vaporisation, even in large vessels, ten gallons and upwards, about four per cent., under the most favourable conditions for its preservation, each hour. Its efficiency in the motor is found to be about four per cent.; that of the steam engine is from seven to twenty and more, and that of the gas and oil engine ranges to still higher figures. In the perfect heat engine the quantity of air required to do the same work within the same range of temperature of operation is about sixteen times as much as of steam; while steam costs nothing as a crude material, and liquid

air costs no one knows precisely what—probably not less than three or four times, perhaps ten or fifteen times, as much as the fuel used with the steam engine or the gas and oil engine. The wild claims of the promoter of the stock company, now in the market for speculative purposes, are probably based on but little better reason than those of Keely or of other mountebanks, often self-deluded, who are continually cropping up.

Romance of a Motor-Car.

A WELL-TO-DO gentleman of a certain age recently purchased a Locomobile, and, needless to say, became an enthusiast. Suddenly his friends were thrown into a state of consternation on hearing that he was about to dispose of the car at a sacrifice, and return to the land of his birth. But the consternation of his friends is nothing to that of his relatives now that the secret of the sudden change of front has leaked out. The whilom motorist, who was regarded as a confirmed bachelor, met his fate whilst motoring in England's leafy lanes, and a lovely bride will accompany him to his home in America. Now, ye village maidens, forgotten of the country youth since he has packed his bag and gone to town to make his fortune, take heart. Soft hearts, and deep pockets too, accompany those dusty knights who whirl past your window.

The Paris-Berlin Race.

THE fatal accident at Reims and the other incidents arising out of the Paris-Berlin race have provoked a great outcry in the Continental Press against the holding of any other exhibition of this sort. In the French Chamber M. Gauthier asked the Minister of the Interior what measures he intended to take to prevent the accidents caused by motor-car races. M. Waldeck-Rousseau replied that he would not have authorised the race if it had only been a question of sport and pleasure, and he had, in fact, only authorised it under very severe conditions. Henceforward no race at a speed higher than that usual for road traffic would be authorised.

Motor-Cars and Railways.

OF the immense advantages to be derived by the introduction of the self-moving carriage, for pleasure or business no one has the slightest doubt. It is remarks Prof. R. H. Thurston in the course of a recent paper, socially and commercially a boon. The social and commercial side of the automobile as a method of transportation is one of real importance, and promises to develop into one of enormous value. While it is true that the railways of a country are its main arteries and its principal veins, it is none the less true that the highways and common roads are its mighty and vital systems of blood-distributing capillaries. Countries exist without railways, but none without highways. The automobile traversing the highways may yet, it is probable, prove some time to be more important in the conveyance of merchandise and passengers than even the railway, importance being gauged by the number of ton-miles of merchandise carried, or by the number of passenger-miles. It is not unlikely that a few years more, a generation at most, may see practically all of our business done, and much of our pleasure-riding carried on, with motor-vehicles in all sections of the country, and on all highways. In fact, for all short-distance lines of transportation, on the scale of a day's travel by highway, for example, there is no doubt that the railway is at an enormous disadvantage, on account of the proportion borne by its terminal costs and charges to the costs and charges of transportation proper. The automobile is the natural and probably inevitable auxiliary of the existing system of railway transportation, and the desired and desirable connecting link between the great arteries and veins, and the capillary system of national inter-communication and transportation.

AN Automobile Exhibition is to be held in Frankfort-am-Main, Germany, from the 3rd August to the 4th September.

THE PARIS-BERLIN AUTOMOBILE RACE.

BY AUTOMAN.

AS the writer of this article, in order to see the arrival at Aix-la-Chapelle, was obliged to leave Paris on the night before the start, he thinks he cannot do better than recount the particulars given him by Mr. Jarrott whilst sitting at breakfast in the Kaiserhof at Berlin last Monday morning.

It was a very fine, clear morning, inclined to be cold, and as the first car was to go off at 3.30 a.m., it was yet quite dark when the competitors turned out. The road to Champigny lies through the Bois de Vincennes, and all along it thousands and thousands of cyclists with their coloured Chinese lanterns lit up the route, which was crowded with every kind of conveyance, from the enormous 50 h.p. motor-car down to the bicycle. Streams of pedestrians coming from every quarter of Paris added to the exodus. Edge and Jarrott were the first arrivals at the starting post, which was occupied by a large force of police, who kept half of the road absolutely free to allow the cars to line up. At three o'clock the dawn began to break, and already nearly all the competitors seemed to be there.

Every few minutes a flash of magnesium light told of someone being photographed. A jolly-looking chap came along with a magnum of champagne and two glasses asking the starters to drink his health for luck. Edge's car, "le monstre," or, as M. de Knyff put it, "the monstrous," in his funny English, excited much comment. The trees along the road had big numbers attached, and the cars took their position according to these numbers, and each time one started the line moved up to the starting post. The arrangements were excellent, and there was not the least hitch.

Mr. Huet was the starter, and at 3.30 prompt, just at daybreak, in clear light, without fog or mist, Giraud puffed off along the straight, clear road, between the crowds of cheering spectators. Then every two minutes the others followed. Charron's turn came fourth—he had a regular jockey outfit, riding breeches, gaiters and cap with flaps. Maurice Farman broke the guard on his fly-wheel and had to tear it off, and just managed to get away in time. Serpollet and Clément had small breakdowns close to the start, but got off again. Altogether 110 cars actually started on their dash for Berlin, all racing for dear life, regardless of fatigue, dust, and danger. Meanwhile all Paris had been alive to the event, and from every quarter right across to the Porte Maillot, from midnight on, competitors and spectators were active. All along the boulevards crowds of the curious were watching for the big cars to go by on their way to the start—a ten-mile run in the dark. It was a really international event, and though no one said so, it was patent to all, an industrial *rapprochement*—the first for thirty years.

After seeing the last car numbered at the A.C.F., I took the 9.25 train to Aix-la-Chapelle; never shall I forget the scene in the Gare du Nord. A half-hour before the time *mecaniciens* came trooping to the station with bundles of tires, inner tubes, batteries, tool boxes, spare parts, and so forth. Then came newspaper correspondents with their wives and friends, then enthusiastic spectators who wished to follow the race. I must not forget the wives, sisters, cousins, and aunts of the *chauffeurs*. The train had to be doubled, and left loaded in an indescribable confusion, amongst which it came to my lot to haul up into the train as it was moving out of the station M. Léon Serpollet's pretty young wife, pushed in from behind by a mutual friend, M. Oliver. Half of the people had not taken the precaution of reserving beds, so that many of them had to pass the night in the corridors or in the restaurant car. I had in my cabin M. Rousseau, of the *Velo*, and M. Lafitte, of the *Vie au Grand Air*. We arrived at Aix-la-Chapelle about 7 a.m., and, after a wash and breakfast, I set off to find a cab, and drove out to the control, some two miles. All along the

Adalbertsteinweg I found the windows already occupied, the pavement lined, and crowds streaming towards the control, flags flying everywhere. At the control a triumphal arch had been erected, as also a grand stand close to which a band of musicians were ready to receive and welcome the invasion. And all of this at ten o'clock in the morning, hours before the cars could possibly arrive. Police and military were, of course, there to keep order, and a very irascible superior officer on a big horse vainly charged and recharged the people, who came crowding on again time after time. I had calculated that the first car would appear between eleven and twelve, as telegrams began arriving from the line of route. At Reims, for some reason or other, we did not hear of Fournier, but de Knyff passed at 6.34, Girardot at 6.42, M. Farman 6.42, Leys 6.45, Pinson

minutes later M. René de Knyff came tearing down on us, hatless and as white as a miller with dust, and waving frantically for the crowd to get back. The sun was now beating down on us with tropical intensity, and I met Madame Serpollet in distress—a ticket for the grand stand had been left at the hotel for her and some objectionable person had passed herself off for Madame Serpollet and secured the ticket; however, with press facilities, I soon arranged the little difficulty, and duly installed her in the front row on the look-out for her husband. There she was destined to wait until 5.29, for the Serpollet car had had bad luck from the start. A few hundred metres from Champigny something went wrong with the pump which caused a considerable delay, and when at last M. Serpollet arrived and saw his wife, he shouted "I have spent

THE WINNER OF THE PARIS-BORDEAUX AND PARIS-BERLIN RACES—FOURNIER ON HIS MORS RACER.

Cliche de]

L'Avenir de l'Automobile.

6.53, Voigt 6.58, Axt 7.01, Jarrott 7.13; Périgord, 7.14; Chauchard, 7.21; Lemaître, 7.35; Rolls, 7.46; Cormier, 7.42; Heath, 7.47. Edge was signalled at Epernay at 7.22 with a punctured tire. At Sedan Fournier arrived at 7.55; Girardot, with a burst radiator, at 8.18; Farman, 8.28; de Knyff, 8.30. From St. Neith, Fournier, Knyff, Hourgières, and M. Farman were signalled in a bunch, followed by Girardot and Charron. Then we heard that Fournier had passed Montjoy, and every eye was directed down the road till at last the puff of dust and little black speck appeared, and down he tore on us amidst roars of cheering and triumphal chords by the band. I was on the road in front of Fournier trying to take a snapshot of him, but in an instant he was surrounded by a dense crowd, and it was with the greatest difficulty that he could get down to sign the sheet. Just twelve

the day in mending tires and getting my car into fit condition to start."

But I am digressing, and getting ahead of my story. It would be useless for me to give the account of all the arrivals, so I will give just a brief list, with their times, and confine myself to special incidents. Maurice Farman arrived at 12.49 and Jarrott at 1.18. I asked him for news of Rolls and Edge, but he could only tell me that he had passed Edge mending a puncture somewhere between Epernay and Reims. At 1.38 Rolls turned up, and I went down to shake hands with him, and tell him where to come and sign, but he seemed half-dazed, and it was with the greatest difficulty that I could make him understand. Giraud, on his light Panhard, arrived at 1.45 and attracted much attention, and then at one minute past three I went to greet Harry Farman and ask him for news of Edge.

Shortly afterwards a telegram was brought to me by one of the officials to see if I could make it out. It was from Edge to Jarrott, and I give it exactly as it was—"Tive punctures nails recovered from these all well these lit hump on bridge broken back cring trying to jet repaired adwire club officies and other interinoit." After struggling with it for some time I made it out to be as follows, which turned out to be about correct:—Five punctures nails recovered from these all well then hit hump on bridge broken back spring trying to get repaired advise club officers and others interested."

In addition to the five punctures and little hump on the bridge poor Edge had had an interview with a tree at Viellemaison in which he and the Napier car had a very narrow escape. I am sorry that my criticism of the Napier was only too true, and it is a pity that, instead of going in for this monster, Napier did not spend his skill in lightening the 16-h.p. car, as he originally proposed. This is, however, another digression, and I must get on with my yarn, leaving Edge at Sedan, for he was not heard of again. Louis Renault signed at 3.17, in his voiturette, only taking an hour and a quarter more for the day's run than Fournier. Brasier signed on at 3.56, looking very miserable, and said to me as he passed, "You don't know what a horrible thing has happened to me." It was only too true, as I learned after, that he had run over and killed a little boy. He told me the story himself across the table at the banquet at Hanover given by the Continental Tire Company, and I will give it to the readers of the *Journal* in his own words, as it will probably be the cause of the suppression of road racing:—"I was between Reims and Epernay," said Brasier, "going as hard as I could lick, probably 62 miles an hour on the open road. I had in front of me a tricycle and a voiturette. The crowd closed in behind the tricycle. I have a whistle and three horns on my car, and I and my *mecanicien* set them all going. The crowd opened to let me pass and left a little boy of ten standing in the middle watching the tricycle and with his back to me. He then heard my horn and turned round, I swerved to the right to avoid him, and at the same instant he rushed in the same direction and struck the front of the car. His cap was thrown up into the air, and I pulled up. The crowds rushed around me and assured me I was in no way to blame. I wanted to give up the race, and remained three-quarters of an hour, but they persuaded me to continue."

But to go back to my story. Out of 109 cars which started from Paris, 82 reached Aix-la-Chapelle. Gilles Hougieres had his steering gear twisted by a collision with a dog, and Foxhall Keene ran off the road into a field, but both of them managed to put things right and get on again. About the control, of course, there were all day many familiar faces—Mors, Darracq, Michelin, Panhard, anxiously awaiting their cars and calculating the times. I chatted with Paul Meyan, of the *Figaro*, busy writing his notes, sitting on the four poster in the little bedroom on the first floor, looking on to the triumphal arch; Rousseau, of the *Velo*; George Prades, of the *Auto-Velo*; Lafitte and his photographer taking snapshots under great difficulties amongst the seething crowd; Raphael, of the *Daily Mail*, with his long curly locks, with a keen eye for any scrap of news floating about. The latter disappeared mysteriously after Rolls had arrived, the reason for which appeared at full length in his paper the following morning. Loysel, on his Panhard, in taking a corner at full speed near Viellemaison, went full tilt into a wall and smashed his machine badly; both he and his *mecanicien* had a wonderful escape, and came off without the least scratch. Madame du Gast, the only lady driver, turned up at 7.9 amidst cheers, and was handed a bouquet. I must not forget either the Mercedes cars, the first of which turned up at 1.57. Of course, there was the greatest excitement amongst the German population, and the band struck up the national anthem. Some enthusiastic old gentleman climbed up and kissed Lemaitre, or rather kissed the dust that covered his black moustache in thick layers. It was exceedingly funny. The Count de Perigord, who arrived at 1.8, looked

like a ghost, and was evidently ill, for he did not leave again the following morning, and abandoned the race. The whole army of the camp followers met again at the station in the train to Hanover that evening—such a dusty, tired-looking crowd. More than half of them had not secured places in the sleeping car, and at Cologne, where we changed, there was another scene of pandemonium, which ended in a large number of ladies and gentlemen passing the night in the restaurant car. So ended the first day of the great race, which thinned down the competitors from 109 to 82.

It was a little after five o'clock on Friday, the 28th ult., when the cars left Aix-la-Chapelle for Hanover—the second stage of the race. Altogether about eighty carriages resumed the journey, the automobilists being in high spirits. Before starting they had to give the authorities substantial guarantees that their cars would return to France. The vehicles started in the same order in which they arrived at Aix-la-Chapelle. A large crowd witnessed the departure. Owing to a fog which prevailed several racers were disabled, and the Count de Perigord, who arrived fourth from Paris, was unable to start owing to indisposition. Fournier, who arrived at Hanover first, led practically all the way. At Oberkassel, however, Girardot got in front. In Fournier's eagerness to overtake his rival the cars collided, but no harm was done to the vehicles, though a boy was injured. At Hanover the winning-post was fixed five miles outside of that town. The Duke of Ratibor and the Mayor of Hanover and a large crowd were in waiting. Telegrams had arrived every now and then announcing that Fournier was leading, and at 2.13 p.m. he arrived in clouds of dust and amid the strains of the "*Marseillaise*," doing the 270 miles in 9h. 7min. 39sec. René de Knyff came next at 2.50, and Anthony arrived two minutes later, making better time than Fournier by 25min. Girardot arrived at 2.54, followed by Maurice Farman at 3.26. Rolls arrived late. He passed Cologne at seven in the morning, but experienced trouble before reaching Dusseldorf. Jarrott arrived at 4.56 p.m.; Giraud came in at 3.26, leading the light cars; Louis Renault was still leading among the voiturettes, and Osmont was first among the motor-cycles.

As early as seven o'clock on Saturday morning a large crowd had assembled at the Trotting Course, Berlin, to welcome the racers. Fournier was the first to reach the winning post. He arrived at 11.46 a.m., and was received with tremendous cheering by a huge crowd. Girardot was second, arriving at 12.8 p.m., Brasier third at 12.26, R. de Knyff fourth at 12.28, Charron fifth at 12.35, and M. Farman sixth at 12.40. M. Farman collided six miles from Berlin with an unknown Berlin motor-car, and his mechanic was slightly injured. The victor made the round of the course at a rapid pace, and as he passed the winning post, which was decorated with French tricolours and flags in the German colours, a military band struck up the "*Marseillaise*." The crowd broke through the line of soldiers and surrounded the car excitedly. Cheers rent the air, and a hundred hands were stretched out to the winner. As soon as the car was brought to a standstill a little farther on the crowd raised him on their shoulders and bore him to the judge's stand, whence he was conducted by Count von Schoenborn-Wiesentheid into the prize pavilion. Girardot, who came in second, was likewise enthusiastically received. Of the other competitors, Osmont, who rode a motor-tricycle, and whose experiences must have been incomparably more trying than those of his rivals, arrived at twenty-two minutes past one. After the last of the racing cars had arrived a procession was formed, in which the competitors in the race, the tourists, and many members of the Automobile Club took part. The long line of motor-cars then proceeded through Charlottenburg, the Thiergarten, and Unter den Linden to the motor-car exhibition near the barracks of the Alexander Guards Regiment. In the evening the competitors in the race and the tourists were entertained at a banquet at the Kaiserhof Hotel. The Duke of Ratibor, President of the German Sporting Club, the Union, presided, and there were also present the Prussian Minister of the Interior, Baron von Hammerstein, the Minister of Commerce, Herr Möller, the Minister of Communications, Herr von Thielen,

THE PARIS-BERLIN RACE: SOME OF THE COMPETING CARS.

M. DERNIER ON GOBRON CAR

M. MORIN ON CORRE CAR

and the Minister of Education, Herr Studt. The general company numbered about 500, of whom nearly half were French guests. Baron van Zuylen, President of the French Automobile Club, proposed the toast of "The German Emperor," and in a brief speech recognised the interest which His Majesty, as the donor of the first prize, had shown in the race. The Duke of Ratibor proposed the toast of "President Loubet," and General Becker proposed "The Sovereigns who had protected the Paris-Berlin Race," the King of the Belgians, the Grand Dukes of Luxembourg and Mecklenburg-Schwerin, and also the Dowager Grand Duchess Anastasia of Mecklenburg, the high protectress of the German Automobile Club.

The following is the rough general classification, in the order of the time occupied on the journey after the necessary allowances have been made for the "neutralised" towns:—

CLASS I.—CARS.		Time.		
Competitor.	Car.	h.	m.	s.
1. Fournier	Mors	17	3	43
2. Girardot	Panhard	18	9	58
3. René De Knyff	"	18	12	57
4. Brazier	Mors	18	46	6
5. H. Farman	Panhard	19	24	21
6. Charron	"	19	57	48
7. André Axt	"	20	2	52
8. P. Chauchard	"	20	31	55
9. Heath	"	20	35	4
10. Jarrott	"	20	35	21
11. Gille Hourgères	Mors	20	41	7
12. Voigt	Panhard	21	43	6
13. G. Leys	"	22	21	5
14. Van der Heyden	"	22	53	31
15. Werner	Mercedes	23	0	49
16. A. Lemaitre	Darracq	23	11	16
17. Clement	Panhard	23	25	13
18. Rolis	Mors	24	49	7
19. Mme. du Gast	Panhard	27	3	11
20. Brillié	Soc. Nancéene	30	13	40
21. J. de Crahwes	Pipe	30	32	19

CLASS 2.—LIGHT CARS.				
1. E. Giraud	Panhard	20	54	52
2. Sincholle	Darracq	23	32	53
3. Teste	Panhard	23	33	45
4. Berteaux	"	23	38	33
5. Edmond	Darracq	24	8	39
6. Kraeutler	Peugeot	26	6	58
7. A. Roland	Gobron	26	14	59
8. Gondoin	Panhard	26	42	43
9. Mercy	Gladiator	27	5	11
10. Dernier	Gobron	28	39	45
11. Hajan	Nesselsdorf	31	48	41

CLASS 3.—VOITURETTES.				
1. L. Renault	Renault	20	33	50
2. Grus	"	24	2	15
3. Oury	"	27	45	15
4. L. Morin	Corre	30	52	1

CLASS 4.—MOTOR-CYCLES.				
1. Osmont	De Dion	20	18	48
2. Bardeau	"	22	5	58
3. Cormier	"	23	29	57
4. Bardin	"	23	39	4

The actual results are as yet absolutely uncertain, as only a very small proportion of the control times have so far been calculated. The arrangements in France were excellent, but in Germany deplorable, and the task of getting all the figures into line is a very heavy one. The probable winners are as follows:—

CLASS 1.—HEAVY CARS.				
Fournier-Mors	"	First		
Girardot-Panhard	"	Second		
R. de Knyff or Brasier }	"	Third		
Panhard-Mors	"			

CLASS 2.—LIGHT CARS.				
Giraud-Panhard	"	First		
{ Sincholle-Darracq }	"	Second and Third		
{ Teste-Panhard }	"			
{ Berteaux-Panhard }	"			

CLASS 3.—VOITURETTES.				
L. Renault-Renault	"	First		
Grus-Renault	"	Second		
Oury-Renault	"	Third		

CLASS 4.—MOTOR-CYCLES.

Osmont-De Dion tricycle...	...	First
Bardeau-De Dion tricycle	...	Second
Cormier-De Dion tricycle	...	Third

Out of fifty-one starters in the Tourist section, forty-one, or about 80 per cent., reached Berlin. In the racing section 110 cars started from Paris, but the arrivals in Berlin only numbered forty-nine. I had a conversation with M. Mors the other night at Hanover. He told me that Fournier's car weighed 27 cwt. 1 qr. 25 lbs., and gives 61 brake horse power exactly. I have also had several chats with Fournier. He meant to win, and knew all his machine could do. He tells me that he had four punctures the first day, three the second, and four the third—eleven altogether.

ROUND ABOUT SNOWDON.

EVERY day during the season a motor-car is leaving Llandudno and proceeding via Conway, Penmaenmawr, Bangor, and Carnarvon to Llanberis. Arriving there the passengers are invited to proceed up Snowdon by the mountain railway, returning back to Llandudno through the Pass of Llanberis, Capel Curig, and Bettws-y-coed, a total distance of seventy-five miles, the trip occupying about eleven hours. The whole excursion, including the drive, the ascent of Snowdon, and a lunch at Llanberis, costs a guinea. For the box seats an extra shilling is charged, while tickets can be taken for the drive only for 13s. 6d. If four or more tickets are taken at the same time by the same party a reduction of 1s. on each ticket is allowed.

This splendid motor-car demonstration—a daily run of seventy-five miles—has been organised by Messrs. A. Deacon and Son, of Llandudno, whose enterprise merits success; and success, we have no doubt, will be attained. The ground covered by this regular service is delightful, and some notes by one who has recently enjoyed the prospect will be of interest. From Llandudno, writes our correspondent, we went off in fine style. The first serious hill climbing was Towyn Hill, which was surmounted with ease, and as we ascended there was opened up a grand mountain range, with Conway Castle and the bridges adding to the beauty on view. Then, on we went across the bridge at Conway, and through Penmaenmawr, Llanfairfechan, Aber, and Bangor, the latter being the most difficult of the quartette to negotiate owing to the narrow streets. The road then went near the Menai Straits, and four miles from Bangor was the slate district of Port Dinorwic, from whence we went right on to Carnarvon, where we stopped for a light lunch and a glance at the Castle. On board again and we were soon away from the county town and gradually reaching Snowdon. The views of the mountains from the village of "Pong Rug" were particularly fine. Snowdon was enveloped in a cloud, but Moel Elilio, Elidyr, and Glyder were discernible. At Cwm-y-glo Snowdon should be easily seen, but the clouds hung heavily, and the promise of a fine view from the summit was remote. Along Llyn Padarn (this is a lake) for two miles and we were in Llanberis.

After a lunch—motoring does accelerate and extend the appetite—and the ascent and descent of Snowdon, we prepared to return. Boarding the motor-car and speeding away to the shores of Llyn Oeris, we went on to Bettws-y-coed, the road to which is all downhill; then, following the prescribed route, arrived in good time and fine condition at Llandudno.

In addition to the regular trip to Snowdon, Messrs. Deacon and Son are catering for those wishful of going shorter trips by motor-car. Twice a day short runs are made round Craigdyon; on Tuesdays and Fridays the waterfalls of Aber are visited; on Thursdays a car runs to Llanrwst and Trefriw, and every day a car goes to Colwyn Bay, returning through the Vale of Moelre. Altogether the experiment is being conducted with enterprise and spirit, and should do much to popularise the automobile among pleasure-seekers.

AFTER THE GREAT RACE.

ENGLISHMEN are accustomed to take most things in a matter-of-course way. They can become excited once or twice in a generation over some great feat of arms or display of valour; but it is hard to sustain their interest in anything beyond the income-tax and a few other irritants. In sporting affairs they have a normal interest which rarely rises above an ordinary cheering point, and universal attention is restricted to the Derby, Henley, the race for the America Cup, with the University boat-race in a declining fourth place. Suddenly, and with a rapidity characteristic of the motor-car, automobilism has claimed the morning conversation in the train—and that is the hall mark of British enthusiasm. We are not much enamoured of short speed contests, and the mile-a-minute man is regarded as a mere butterfly; the British people prefer endurance and staying powers, and when—as in the Paris to Berlin motor-car race—these are combined, they naturally get beyond the ordinary degree of excitement. This was shown during the progress of the race by the columns of incidents with which English newspaper readers were regaled, and by the prominence given the event on the placards. The race was followed with keen interest, and it was satisfactory to observe that the few accidents that occurred were generally rightly attributed to the stupidity of the victims, and not the criminality of the automobilist. For that changed attitude the demonstrations of the Automobile Club and the insistence with which the technical Press has protested against misrepresentation must be thanked.

Automobilism is a many-sided subject. Mr. Balfour hails it as the distributor of our people from crowded cities; the small farmer recognises the help it will render in the early marketing of his produce; the Society man and woman glory in the way it is adding to the possibilities of friendly intercourse between acquaintances in country districts; and the professional man delights in the saving of time with which its use is accompanied. These are four tangible proofs of the value of the motor-car. Another has now to be added, viz.—the opportunity the automobile has provided the people of Germany to fraternise with those of France and for both lands to recover some of that earlier cordiality towards each other which the memories of the war have lately prevented. The motor-car race from Paris to Berlin will make easier the task of German and French diplomatists in maintaining respectful relations between the two countries.

But it is not of the political value of the automobile that we propose to write. That is but an incident in the story of the race, the main features of which are recorded elsewhere in the present issue. There are other aspects from which England can learn much and profit greatly. All the way from one capital to the other, the local authorities did their best to enable the motorists to demonstrate to the world the power and sustained speed of the motor-car. Within certain towns a comparatively slow rate of progression was enforced—and in one of those towns the most conspicuous accident occurred—and elsewhere the inhabitants were warned by proclamation not to stand in the path of the cars as they raced through. Such a sensible injunction was almost universally respected. A few silly boys dared fate in dodging across the roadway as the cars approached; and they paid the penalty. But, sad as those accidents were, we would insist that they should be attributed to the folly of lads and not the wantonness of the automobilists.

Everyone seems to have recognised the importance of the event, and the Emperor of Germany's thoughtful action in constructing a bridge across the River Moselle at Treves for the special use of the competitors in the great automobile race was universally appreciated. As the contest was fostered by thorough sportsmen and encouraged by the Kaiser and by the President of the French Republic, the local authorities naturally did their best to ensure success. The way of the motorists was between two avenues of faces, the owners of which cheered the speedy and sympathised with those whose mechanism went awry. It was a demonstration of open-minded regard for a new industry that will add to

the pleasures of men and ease the burdens of horses. It was a tribute to the staying power of the individual as well as of the machine, and it was everywhere regarded as giving the seal of international sanction to the motor-vehicle that will assure manufacturers and inventors throughout the world of the lucrative vein that is within their reach.

While gladly acknowledging the importance of the event we do not necessarily advocate that our main roads should be occasionally made the scene of such popular contests. Our English nature is too conservative to appreciate the rapidity of motion of some of these fast machines, and our roads, with their frequent turns and windings, are not suitable for such competitions. But we would draw a contrast between the way in which the local bodies of the Continent regard automobilism and the harassing attitude of some of the lesser authorities in this country. How would, to mention one typical instance, the East Berkshire County Council appreciate a request that they should give facilities for a short motor-car race through their area? Probably, they would seek powers to consign the applicant to the county gaol, or apply to a J.P. for his temporary detention elsewhere. Almost every journal of distinction acknowledges the engineering advances of other nations and deplors the lethargy of our own people. Here is a department of industry in which makers want encouragement, instead of which they are worried by the constant agitations of pettifogging Councillors who cannot comprehend why anyone should want to have a vehicle drawn by any other means than that by which Boadicea was drawn into battle, or—to go back still further—by any other animal than that owned by Balaam.

We hope, therefore, that the way in which the Paris to Berlin race was assisted by the local authorities, and the enthusiasm which universally prevailed, will cause our local magnates to reconsider their attitude. The educational process has been energetically carried on in various ways. There was the 1,000-mile Trial; there has been the series of demonstrations before County Councillors; the publication of a penny weekly journal wholly devoted to the subject has played its part; and now the great contest in which 110 cars travelled over 700 miles without any serious breakdowns or delays proves their increasing reliability. More than that, the ease with which M. Fournier stopped his car within two feet of the goal testified to the absolute control which a driver—after three days' severe tension—can exercise over an automobile. Altogether motorists are well pleased with the recent race, and we trust its effect will be of permanent value to the industry. The interest was not confined to the Continent; our own daily papers found space for its announcement on their placards, and gave columns to its progress. On one point they are agreed—viz., that the automobile will do much to improve the state of our public highways. On the Continent this is frankly acknowledged, and everywhere the development of automobilism and the improvement of roads is progressing simultaneously. The ratepayers do not grumble, for they foresee a revival of the prosperity of the old coaching days along many main thoroughfares. Hotels are being refurnished, and new life is being given to many a country town by the motorists who tour through France and Germany. Such a revival is possible in this country, and local authorities can hasten its advent by maintaining good roads and showing common sense in their proposals with regard to motor-car regulations. These are points brought out by long-distance contests abroad, and they cannot be too often emphasised in less friendly circles at home.

A 5 H.P. Decauville car is to accompany Mr. Baldwin's Polar expedition. Though it is doubtful whether the state of the ice will admit of its being used, it is highly probable that the motor-car will nevertheless establish a record of furthest north.

At a meeting of the Competitions Committee of the Automobile Club, held on Monday last, it was held that pedalling in motor-cycle races, either on the path or the road, after the start of a race could not be permitted in events advertised to be held under A.C.G.B.I. rules.

FLOTSAM AND JETSAM.

BY "FLANEUR."

FELICITATIONS to the *Standard* for having evolved one of the most screaming "howlers" that has ever seen the light of day! In a long description of the finish of the now historic race from Paris to Berlin, the Berlin correspondent of that journal recounts his interview with the victorious Fournier, who is represented as ejaculating that, with the exception of punctures, he had come through "without a spanner."

Without a spanner! Is it not wonderful? In the amazing lucubrations to which the daily papers have treated us during the progress of the race, and after, sometimes it has been the correspondent who was at sea, sometimes the telegraph clerk, sometimes the sub-editor who "dressed" the message, and sometimes the leader writer who aired his comments on the obviously unfamiliar topic. In the case in point there is no difficulty in determining the genesis of this execrating joke. The correspondent was right; the sub-editor was hopelessly gravelled. What the former wrote was undoubtedly *sans panne*—"without a breakdown." The sapient sub-editor apparently followed a cryptographic train of reasoning—save the mark! He tacked the final letter of *sans* to the beginning of *panne*, and produced *spanne*. If he knew no French, the reflections of the melancholy Jaques on the seven ages of man would still remind him that *sans* meant "without," and forthwith he incontinently assumed that *spanne* meant "spanner." *Ergo*, with the added assumption that the telegraphists had dropped one letter, he arrived at the brilliant interpretation—*sans spanne*, "without a spanner." Clearly the talents of this young man—or was it an elderly fossil?—are wasted in the sub-editorial room; he should be unravelling the mysteries of the Baconian theory. "Something new and strange" might confidently be awaited.

BUT the *Standard* man, to do him justice, is not alone. The *Daily Telegraph* described the Hon. C. S. Rolls as having been delayed by an *exhausted valve*! However was this feat accomplished? "Exhaust valves" we know; they are on every petrol-driven car, quadricycle, tricycle, and bicycle, but "exhausted" valves must be the exclusive patent of Peterborough Court. Certainly no automobilist ever saw or heard of one before. So much for sub-editorial errors. As for those of the correspondents, their name is legion, and one simply cannot afford the time or space to discuss them in detail. In every line almost of the various telegrams it was palpably manifest that the journalist responsible for the report had kept his eyes closed against the automobile movement, and was ignorant of its most rudimentary data. Even in so small a matter as dress the *Daily News* referred to "rubber" garments, and the *Daily Express* and other journals to "oilskins." Everyone who has even a nodding acquaintance with the subject knows that the garments in question were made of leather, and to speak of "oilskins" is the very first sign of a novice at the game.

It is impossible to let pass without mention, however, one or two of the editorial articles which appeared on Monday. The *Daily Telegraph* had a characteristic leader, a very model of the art of word-spinning without a correct basis of facts. It bristled with misstatements, and, relatively unimportant as some of these were, they were typical of the slipshod manner in which the subject was approached. Even the *Daily Telegraph* arithmetic was wrong. Antony was referred to as having "covered some of the ground at an average pace of over eighty kilometres, or nearly sixty miles an hour." As a matter of fact, eighty kilometres equal fifty miles. "Upon particularly good stretches of road a number of the crack competitors," said the *Daily Telegraph*, "must have made the highest speeds of the most famous express trains." They did even better. The express scores by reason of its exclusive track; the racing automobile can go faster, but must vary its pace more often. Fournier worked his machine at a mean speed of more than sixty miles an hour when he won in the race to Bordeaux."

This, again, is inaccurate; his average was fifty-three. Further on, the races are referred to as "Juggernaut performances." What evidence is there to justify this wholesale condemnation? All the French races have been singularly free from accident, and the Paris-Berlin has but shown, what everyone knew already, that the high road is not a children's playground. Another erratic statement is that "On the whole, recent accidents have shown that they" (automobilists) "probably inflict as much damage upon themselves as upon the lieges." What are the "recent accidents" referred to? They are so few in number that they cannot reasonably be accepted as a basis for generalisations of any kind.

As usual, the *Daily News* is unconsciously funny. It may be remembered that when Mr. Balfour suggested the use of motor-cars as a means of relieving the congestion of town life, the *Daily News* attempted to be satirical at his expense, and, in the fulness of its ignorance on automobile matters, insinuated that motor-cars were useless for this or any other purpose. The extraordinary times and distances accomplished in the Paris-Berlin race appear, however, to have somewhat stimulated the perceptions of this sceptical journal, and it has now delivered itself of this extraordinarily complacent effusion:—"Mr. Balfour's famous motor-car theory for relieving London overcrowding has been rejected by most experts, but in the sparsely populated agricultural districts the new method of locomotion, by virtue of its exceeding adaptability and small initial cost, should prove a boon which the farmers and their landlords would be foolish to ignore."

REALLY, this is colossal in its ineptitude. Because fast racing-cars have bridged Berlin and Paris at the speed of an express train, the *Daily News* recognises as the sole field for the automobile that it should be used for carrying goods for agriculturists. What admirable condescension! One may nevertheless inform the *Daily News* that experts did not condemn the scheme of Mr. Balfour, and remind that journal further that it has "put its foot in it" more conspicuously than ever. Motor-cars of the type of those used in the Paris-Berlin race, in either section, have no kinship with the class that will eventually relieve the grower of fruit. The latter, which are mostly steam-driven, are known as "heavy goods wagons," and are subject to peculiar regulations, one of which is that their speed shall not exceed five miles an hour! One fails to see what M. Fournier's splendid performance on a petrol car has to do with vehicles of this description.

AN automobilist may reasonably contend that inasmuch as his vehicle is the most completely under control of any it should be the last in the world to be subjected to restrictions of an exclusive kind. Consequently wherever a new regulation is issued against the motor-car the fact is of interest, if a melancholy one. It is with considerable regret that I learn that automobiles are to be literally banished from the most picturesque portions of Switzerland, an embargo that altogether defies explanation or excuse. The prohibited areas comprise:—All the Alpine passes, with the exception of the St. Gotthard; the roads of the lateral villages of Valais; and, worst of all, the roads of the Canton Grisons. This absolutely prevents one from visiting the glorious Engadine *en automobile*, or from climbing such picturesque passes as the Grimsel, the Furka, the Albula, the Julior, the Flüela, and many others I might name, and which I have crossed with no small amount of satisfaction. Anyone who knows Switzerland will realise how completely this extraordinary ukase will shut out the most attractive centres from the automobilist's scope, and nothing could well be more deplorable to the lover of grand scenery.

THE contributor of "Electric Automobile Notes" to *Lightning* makes the confession that he does not read the *Motor-Car Journal*, and then proceeds to quote from our columns. If the statement is true, our young friend is not so well informed as he might be. Fancy the writer of a motor column in a class newspaper not reading the motor-car papers!

THE DEMONSTRATION TO MUNICIPAL AND COUNTY ENGINEERS AT LEICESTER.

IN accordance with arrangements made by the Secretary of the Automobile Club, several cars duly left London on Friday last week for Leicester to assist at the annual meeting of the Incorporated Association of Municipal Engineers. Mr. Johnson was on his Darracq, Mr. Gorham on his De Dion,

a.m. there were over forty assembled outside the Town Hall. The vehicles were for the purpose of conveying nearly 200 of the municipal engineers on a visit to the sewage farm, and the Enderby, Narboro' and Croft quarries. The cars first of all went in procession through the town, and we should imagine took in every back street, and in that peregrination filed through coal, goods, and other yards. The first and a very long stop was at the sewage farm, where the processes were carefully explained. Luncheon, after the party had witnessed the processes of blasting, was partaken of in a large tent, where over 300 sat down to a

THE CARS AT THE TOWN HALL, LEICESTER.

THE VISIT TO THE ENDERBY HILL QUARRIES.

[Seville and Co., Leicester.

Mr. Midgeley and party on a Gladiator, and Mr. Cordingley on his "M.C.C." Panhard. The day was a beautiful one, and the journey was much appreciated, Leicester being reached without incident. On Friday night a number of gentlemen of the Nottingham Automobile Club were assembled and a meeting was called by Mr. E. G. Mawbey, the President, at the Grand Hotel at ten o'clock, when arrangements for the morrow were discussed.

Shortly after eight o'clock on the Saturday morning cars began arriving from Nottingham and Coventry, and before nine

most sumptuous and well-served repast. Some more "firing" on a most extensive scale was seen after luncheon. The party then made their way to Croft, where the extensive quarries were visited, and tea partaken of, and the party duly reached Leicester about seven o'clock. The day was a magnificent one, and the forty odd cars in succession caused such clouds of dust as surely were never seen on roads before. The whole of the arrangements of the day were in the capable hands of Mr. Johnson and Mr. Atkey, the popular secretary of the Nottingham branch of the Automobile Club. The following is a list of the cars present :

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Carage open day and night, all cars in stock, 100-104, Long Acre, W.C.

Mr. G. H. Kirk, 12 h.p. Peugeot (with the president, Mr. E. G. Mawbey, and the Chief Constable of Leicester, Mr. T. W. Lumley, on board); Mr. A. F. Bird, 12 h.p. Panhard; Mr. Gorham, 4½ h.p. De Dion; Mr. C. Cordingley, 6 h.p. M.M.C. Panhard; a M.M.C. 5 h.p. voiturette; Mr. F. G. Smith, New Orleans voiturette; a M.M.C. 6 h.p. Granville wagonette; Mr. W. D. Wells, 6½ h.p. Daimler; Mr. H. Belcher, 4½ h.p. Humber; Mr. Budge, 4½ h.p. Humber; Mrs. Kennard, 9 h.p. Napier; Mr. Urquhart, 7 h.p. Daimler; Mr. F. G. Rendle, 6 h.p. Daimler; Mr. E. M. Iliffe, Ariel quad.; Lieut.-Col. A. F. Mulliner, 7 h.p. Daimler; three Universal Motor Co.'s 6 h.p. M.M.C. wagonettes; Daimler Motor Co.'s 12 h.p. Daimler; Mr. S. B. Hodgkin, 6 h.p. Daimler; M.M.C. 6 h.p. dog cart; M.M.C. 6 h.p. tonneau; M.M.Co.'s 7 h.p. Wynton wagonette; M.M.Co.'s 10 h.p. Marlboro' phaeton; M.M.Co.'s 6 h.p. Lynton wagonette; M.M.Co.'s 6 h.p. phaeton; M.M.Co.'s 12 h.p. wagonette; Daimler Motor Co.'s 6 h.p. car; Mr. M. Ross Browne, 4½ h.p. De Dion Voiturette; Mr. H. Rimington, 6 h.p. Daimler; Parr and Co.'s 5 h.p. voiturette; Mr. G. Cowen, 6 h.p. Daimler; Mr. E. Estcourt, 6 h.p. Daimler; Mr. S. Harvey, 3½ h.p. Renault; Mr. J. A. Holder, 5 h.p. Serpollet; Mr. F. E. Burton, 4½ h.p. De Dion voiturette; Mr. A. E. Crowdy, 6 h.p. Darracq; Mr. Foster Pedley, 24 h.p. Daimler; Mr. R. Cripps, 3½ h.p. Progress voiturette; Mr. R. R. Latham, 3½ h.p. Benz; and Mr. C. Johnson (with Mr. A. R. Atkey) 6 h.p. Darracq.

HERE AND THERE.

THE Automobile Club Bourguignon will hold a hill-climbing competition up the Val Suzon Hill, near Dijon, on Sunday next, the 7th inst.

EIGHTEEN Daimler public-service cars belonging to the Elinburgh Autocar Company, Limited, are to be put up for sale by auction on the 10th inst.

THE Queen, accompanied by Miss Knollys, and attended by Sir Dighton Probyn, again visited St. Edmund's, Hunstanton, on Thursday last week, journeying from Sandringham by motor-car.

THE day following the King rode to Hampton Court on his motor-car on the occasion of the grand concert in the great hall of the Palace.

MESSRS. BENNETT AND WOOD, LTD., of Sydney, recently received a shipment of the latest pattern motor-quadracycles. Three of the machines have been delivered to country districts, and, from the owners' reports, they have given every satisfaction.

HODSON AND COMPANY, LTD., was registered on June 13, with a capital of £2,000, to acquire and to carry on the business now carried on at Liverpool as Hodson and Co., and to carry on the business of cycle manufacturers, builders of motor-cars, and carriages of all kinds, etc.

THE members of the Scottish Automobile Club engaged in a very enjoyable run to Stirling on Saturday last. The Edinburgh contingent was joined at the village of St. Ninians by the western members, and the party, to the number of forty, lunched in the Railway Hotel, under the presidency of Mr. Norman D. Macdonald.

NEW sizes of the Salisbury-Bleriot lamp are being introduced by Messrs. Salisbury and Son. The new sizes are for use upon motor tricycles and quadracycles, also for light voiturettes and small cars, and have been introduced owing to the great success of the larger lamps and a wide demand for a lamp of equal power but suitable for small cars.

MR. DOHERTY, who was for three years foreman copper and tin smith to the Motor Manufacturing Company, has opened works of his own at Day's Lane, Coventry. It is his intention to bring his knowledge to bear upon water-tanks, petrol-tanks, silencers, lamp boxes, battery boxes, carburettors and all kinds of sheet work appertaining to motor-cars. Bearing metalling, and aluminium panels and wings to order will also be specialties of the new concern, which will trade under the style of the Doherty Motor Accessories Company.

THE Automobile Club of Ireland held a run from Dublin to Drogheda and back on Saturday last.

MR. T. W. HAMMOND, of 9, Lower Addiscombe Road, Croydon, stores both Pratt's motor spirit and Carless Capel's petrol, oils, greases, etc., which can be obtained by motorists at any time.

OWING to the success attained by municipal motor-cars for refuse collecting, street watering, and snow clearing in Westminster, the Lambeth Borough Council have decided to adopt them.

INCLUDED in the sports at Southsea last week was a five miles motor cycle handicap. There were altogether twelve starters, the winner being Mr. J. J. Leonard, who, on his Werner motor-bicycle, covered the distance in 8 minutes 54 seconds.

WHILST travelling from London to Brighton in a motor-car with his wife a gentleman discovered a carman lying injured and unconscious on the road at Merstham. He at once removed his luggage from his car, and, leaving his wife behind, promptly conveyed the man to the Croydon Hospital.

WE are glad to be able to report that entries for the Glasgow Exhibition automobile trials are being sent in at a rapid rate. Quite a number of entries have been received in the private owners' section, among the latest being the new 16 h.p. car of Mr. C. Cordingley.

THE Bosmere and Claydon Rural District Council has adopted a resolution that "in the opinion of the Council motor-cars should bear a distinguishing number, and that all drivers of motor-cars should carry a certificate as to their qualifications as drivers."

WE understand that application has been made to the Watch Committee of Folkestone for licences for motor char-a-banc. The proposal is to place at least half a dozen of these vehicles on the roads, to ply between Folkestone and Hythe, and also to convey passengers for country trips at nominal fares.

MR. F. W. HUDLASS, of the Phoenix Motor Works, Southport, had two motor-cars destroyed in a fire which lately occurred at Messrs. Hill's carriage works in that town, whither they had been sent to be painted and finished. We extend our sympathy to Mr. Hudlass, the fire resulting in the entire loss to him of the value of the two cars.

AT five o'clock to-day (Saturday) there is to be held at Dashwood Hill, by the Automobile Club, a hill-climbing competition, which is open to all motor-vehicles, whether entered by members of the Club or not. Each competitor will be required to ascend the hill three times. Dashwood Hill commences at the thirty-third milestone from the Marble Arch on the old Oxford Road, and is reached via Acton, Ealing, Hanwell, Southall, Uxbridge, Beaconsfield, and High Wycombe. The pedalling of motor-cycles after passing the starting-point will not be permitted. At the time of going to press we learn that nine entries have been received.

AN interesting and eminently practical application of the motor is now being made by Messrs. Hutton, of Summerhill, Dublin. They have despatched Mr. H. Wells on a Werner motor-bicycle to make a complete tour of Ireland. At every stopping-place Mr. Wells will make arrangements about the storage of petrol, motor accessories, etc., for the use of tourists, and he will also, of course, put the Werner through its paces for the edification of anyone interested in automobilism.

MR. F. R. SIMMS has been appointed consulting engineer and advisory director to the motor department of Messrs. Geo. F. Milnes and Co., Limited, of Hadley, Liverpool, and Birkenhead. Their petrol cars and frames for either business or pleasure purposes are at present being manufactured by the Motorfahrzeug and Motorenfabrik Berlin Gesellschaft, of Marienfelde-Berlin, in accordance with specifications by Messrs. Simms and Co. At present the bodies only for these frames are made at Messrs. Milnes' Works at Hadley, but it is their intention to manufacture the cars throughout in this country under the style of "Milnes," which name has been so well known during the last forty years in connection with the building of tramcars.

CORRESPONDENCE.

YORK TO LONDON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, F. Hunt, in the issue of the 22nd ult., gives us some very interesting details as to the running of a Serpollet car. He is very pleased, and states he has created a record by his performance of 199 miles in 19½ hours. This works out a running average of less than "legal limit." An 8 h.p. Panhard can easily do this journey in nine or ten hours. I know one instance at least in which the run was done in nine hours. He states the cost for running the 8 h.p. Serpollet was 21s. 8d., or about ¾d. per mile. An 8 h.p. Panhard would have consumed about eight gallons of petrol and half-gallon of oil. Take petrol at 1s. 6d. and oil at 2s. 6d.; total cost 13s. 3d., or about 0·8 of a penny. Where, then, is the vaunted superiority of the steam car? If this particular run was a "record," what must the poor man with a "steamer" do in ordinary runs? His statement as to "many owners of these cars giving them up because of the difficulty of finding men to run them" affords much food for reflection.—Yours truly,

J. E. H.

THE CREESE MOTOR STARTER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your issue of June 15th, "Shifter" is good enough to recommend the inventions of the Creese Motor-Starter Company. I am having a good deal of trouble with my car, fitted with two-cylinder engines, and have been recommended to adopt the Creese device. I shall be glad if "Shifter" or any other motorist who has used this system will favour me with his experiences.—Yours faithfully,

INQUIRER.

MOTOR HORNS AND BELLS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think that a regulation to prevent the use of horns, bells, etc., except by the special vehicles, would be better than all kinds of petty persecutions. The use of horns by cyclists and bells by some motor-cars is very confusing, and I would suggest that the A.C.G.B.I. might bring the matter forward with advantage. I think that horns should be used for motors only, and of two different musical pitches, to distinguish between light cars, quad, and tricycle, and the heavier cars. It should be an offence to make use of any sound that is reserved as a public signal for any other purpose but its legitimate object.—Yours truly,

W. T. WARNE.

THE NOMENCLATURE QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I would again press upon all who are interested in automobilism the importance of having the question of suitable nomenclature taken up and dealt with in a practical manner. Will the Automobile Club, which is doing such splendid work in many ways, be good enough not to consider this subject as beneath their notice, and appoint a committee to give us some leading in this matter? If this is not done, and soon, we shall never be able later to get rid of many names and phrases, which will tell to all time that we have been behind the world in power traction matters. It was with real disgust that I saw the other day the premises provided for autocar storage, through the energy of Mr. Harrington Moore, styled in large letters "Automobile Club garage." Surely, words can be found in the English language to describe a place for housing autocars without going to France for a word not very pleasant to pronounce in French, and ridiculous pronounced as if it were English, which, of course, it will be by the too numerous Englishmen who know no French. Surely motor-house, autocar-shed, or stable would serve our purpose. When we speak of "the stables" we include the coach-house, and as we have our driving power and our carriage in one in the autocar, it appears to me that the expression autocar-stable would do very well.

I give the above as an instance, but there are numerous foreign expressions insinuating themselves into our motor-talk,

which should be exorcised at once, and let us talk in decent Anglo-Saxon—a language which has plenty of good words without our borrowing from our French neighbours. I would also again beg that the question be considered whether we should not have a generic word to contrast our vehicles with horse-driven carriages. And no better word can be found than "power," which is expressive and conveys its meaning at once. Power-traction, power-omnibus, power-cab, power-lorry, power-wagon, power-cycle, all express what it is desired to express, viz.: that the vehicles are not hauled by animals, but carry their moving power within themselves. The result of our having no generic word is that the names we use convey nothing to the general public, whom we desire to interest in the new locomotion. What do Ariel, or New Orleans, or Panhard, or Daimler, or Peugeot convey to them, without some generic word along with them? What we should strive to do is to keep before the public the fact that power-traction is progressing, and it is only by their seeing the same word time after time, and day after day, that they will be awakened to the fact that automobilism is a reality and advancing with rapid strides. Whenever that conviction reaches the Man in the Street, he will step out too.

Therefore, I again say let the Club take this matter up as a serious factor in our prospects of public progress.—Yours truly,

J. H. A. MACDONALD.

FRONT DRIVING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It may interest your readers to know that patents have been applied for in England and on the Continent for front driving wheels as suggested by Mr. Sennett in his recent interesting article entitled, "A Run Across France on a Racer." The specifications do not include fore-carriage traction, but that which I think is still better—the Ackerman system of steering applied to all four-wheels, which may also be drivers if required. Mr. Sennett in a previous article suggested a better transmission gear. Such a device is also included in my specification. It consists of a new variable double friction gear from which any speed may be obtained with one lever, without taking it out of gear. It also answers for the starting clutch, is quite silent, does away with the four pairs of cog-wheels where there are four speeds, is very much cheaper in first cost, as well as in the up-keep, and can be fitted to any car. My idea was derived from reading Major Bethell's paper published in your *Journal* about the end of March. I called my design a military vehicle, and it was in the Patent Office a week before the War Office prizes were offered. I also have a design for a six-wheel lorry, all drivers, and shall be pleased to send further particulars to any of your readers. I think that front drivers, besides having other advantages, would drive heavy racing cars with about half the power now required, and that, with all four wheels driving, a heavy winter road would present no more difficulty than do the roads at present.—Yours truly,

GEORGE FREESTONE.

THE SPRAG DIFFICULTY AGAIN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Mr. Thatcher's letter in a recent issue, I would recommend him the arrangement described in your *Journal* of Saturday, May 4th last. I and other friends have used this sprag a good deal and find it absolutely satisfactory.—Yours faithfully,

W. R. PIDGEON.

THE 70 H.P. NAPIER CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I thank you very much for your reference to a letter of Mr. Weigel's in the *Vélo*. I may say that he has absolutely no authority from me to make such a statement as he did, and that in every respect his action in the matter is entirely unwarranted so far as I am concerned. Unfortunately, Mr. Weigel's ideas change so rapidly that it is rather difficult to know what he really wishes to convey from his various letters. He objected to the Napier being a very fast car, but now that it has publicly done a faster time than any other car he tries to get his French

friends to believe that I wish to issue challenges against all French carriages. I am not aware whether Mr. Weigel is as well known in France as in England. Of course, if he is, his judgment on these matters will no doubt be given due consideration.—Yours truly,
S. F. EDGE.

ANOTHER GOOD RUN ON A SERPOLLET STEAM CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In connection with your correspondent's (Mr. F. Hunt) run from York to London on a Serpollet carriage, we may mention that we ourselves had a run on one recently which was better from several points of view, although the distance was not so long, being only 120 miles. Leaving our garage King's Road, Reading, at 11.20 a.m., we arrived at Woodbridge, via London, Chelmsford and Ipswich, at three minutes past eight. The run was in no way a fast one, as it was taken entirely for pleasure, and there was a considerable amount of time on the road occupied in refreshments, to say nothing of about thirteen miles of congested mid-day London traffic. Only twelve gallons of paraffin were used on the journey, which works out at ten miles per gallon. At 6d. a gallon, the cost works out $\frac{1}{2}$ d. per mile; the car was a large four-seated one of 8 h.p.

Mr. F. Hunt mentions that during his run not a single bolt or pin gave way. We would like to point out that our experience has led us to believe that nothing requiring attention on the road is the rule, not an exception. We ourselves on this journey were favoured with the same results, and we have been for several thousand miles on different Serpollet carriages. While admitting Mr. Hunt's to be the record run for the distance, we claim record for the shorter distance both from the point of speed and oil consumption.

We may mention that we have made a special feature of the Serpollet carriage for the last twelve months, having been over the French works three or four times, and have printed notes upon the management, which we shall be pleased to place at the service of any who have difficulty with this carriage.—Yours truly,
THE SPEEDWELL MOTOR COMPANY.

ALLEGED NARROW ESCAPE OF LORDS TREDEGAR AND CAWDOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Herewith enclosed please find some interesting cuttings re motor-car incident—Lords Tredegar and Cawdor said to have been in danger. Now, as a matter of fact, I had driven on my motor-car to a small village named Carleton (5½ miles from Newport), and had stopped the engine whilst transacting my business. Just as I was about to start again I heard a couple of horses galloping from the opposite direction. I immediately ran on to the main road and succeeded in stopping one. They were attached to a mowing machine, and it appears that a Daimler motor returning from Cardiff to London had caused them to bolt. I was glad to find that an accident of a serious nature had not occurred. As to the alleged danger to their Lordships, the report was quite unfounded, and in all fairness to the driver of the Daimler, he appeared to be driving with care. Strange to say, the carriages containing Lords Tredegar and Cawdor passed the Daimler car before my own eyes, and neither of the horses took any notice of it. The passing actually took place about three-quarters of a mile from where the horses attached to the mowing machine were frightened. As a motorist I feel it my duty to forward these particulars.—Yours truly,

ERNEST E. HARRIS.

THE British Power, Traction, and Lighting Company, Limited, of York, writes:—The paragraph relating to Mr. C. Arthur Pearson, p. 337, in your issue of June 29th, stating that he had "gone to America in search of an automobile capable of travelling a hundred miles an hour" is incorrect to this extent: Mr. Pearson ordered that car at the P.T.L. Gardner-Serpollet Works, in York, on May 29th, 1901, before he went to America, and as the result of a 100-mile trial run which he and Mrs. Pearson made on one of our carriages on Whit-Monday.

LONDON COUNTY COUNCIL AND MOTOR-VEHICLE REGULATIONS.

LAST week we published the text of the eminently sensible report of the Highways Committee of the London County Council, describing as entirely unnecessary the numbering proposals of the Berkshire County Council. This report should have been discussed on the 25th ult., but was postponed until Tuesday last, when it was debated before a full house. Mr. Mark Mayhew, who is at all times ready to defend the interests of automobilists generally, had confided to us his fears that, as the whips would not act on a non-party question of this kind, there was a possibility that a majority might be found on the Council who would wish to refer the recommendation back to the Committee, and pronounce in favour of numbering restrictions. An amendment in favour of this course was, indeed, moved at Tuesday's meeting by Mr. Wiles (St. Pancras), who received the support of Mr. Russell Spokes. Mover and seconder aired the familiar arguments of the uninformed that motor-car accidents were numerous, that automobilists were persistently regardless of the safety of others and the commands of the police, and that, so far as concerned the carrying of numbers, the cars were already so ugly that a number would be no further disfigurement.

Then Mr. Mayhew stepped into the breach, and in a strenuous speech he pointed out the encouragement that was being offered by foreign Governments to the automobile industry, because they saw that the motor-car was to become the solution of some of the most difficult social problems. The demand for increased facilities of locomotion was an urgent one. The motor-car would fulfil those requirements, but it would not be perfected if the wings of the amateur user were clipped. Continental authorities had done all they could to encourage the amateur user because they knew that the commercial man would wait for the perfect machine, and it was the amateur user, whose time was his own, and who had the inclination, as well as the money to spare in driving an imperfect machine, who found out the imperfections, and brought them under the notice of the maker. The more amateur drivers there were the sooner would we arrive at the cars which were to carry the working classes from town to country and *vice versa*. Therefore, he urged them to encourage the amateur. He could understand the outcry for numbering if cars were continually causing accidents. The editor of the *Motor Car Journal* had reported to him that since the paper was started, two and a quarter years ago, there had been but three accidents in London in connection with motor-vehicles. During the same period there had been but twenty prosecutions for furious driving of motor-cars in London, and as the police found that there was difficulty in securing convictions in prosecutions for furious driving because no one's life or limbs had been endangered, almost all these prosecutions were for driving at more than twelve miles an hour. Numbering was proposed merely to identify the few offenders who refused to stop when called upon to do so by a policeman or person in charge of a restive horse. Chief Constables admitted that such offenders were very few. These, moreover, would not be caught even by numbering, as a man who would be guilty of failing to stop would not hesitate to cover his number when guilty of fast or dangerous driving. Mr. Mayhew proceeded to contend that there was no necessity for numbering; that numbering would prevent many persons from driving cars; and that it would be of no use whatever, as real offenders would conceal the tickets. Fast locomotion, he went on to say, was considered so great a necessity that it was at present carried out at the cost of hundreds of the lives of our countrymen per year without remark. In 1899 there were between 15,000 and 16,000 railway men injured on the railways of this country, and about 500 killed. It was the duty of the London County Council to lead other County Councils. Its members had more enlightenment than their brethren in the country districts, and having their fingers more continually on the pulse of human life they were in a better position to foretell the future. It was easy to see that in the near future the automobile industry would be one providing work at high wages for thousands and thousands of workmen.

If the movement were strangled in this country we should see English gold going to pay French workmen and purchase French material. Already it was doing so to the tune of a quarter of a million pounds sterling a year, in the very early days of the industry. If, on the other hand, we refrained from legislation when legislation was unnecessary, as in the present instance, it might be hoped that ere long the tide might be reversed, and French, German, and American gold would be coming to pay for English labour and material in the automobile manufactories in the old country.

Mr. H. W. L. Lawson could see no objection to numbers, but thought that they would be absolutely useless, and would vote against them.

Mr. John Burns made a very practical speech against the harassing of a new industry, and said that any further means of identification were absolutely unnecessary, in proof of which he adduced the fact that Mr. Mayhew had that very morning been fined £5 and costs at Lewes for driving a motor-car furiously at Brighton. Loud and continued merriment followed this bold sally, which was enjoyed by no one more than Mr. Mayhew himself. Mr. Beachcroft supported the amendment; he eulogised the speech of Mr. Mayhew, but believed his views to be mistaken. Sir Arthur Arnold rose to speak, but the closure was moved, and the question was put. Fifteen members voted for the amendment, but a forest of hands were held up against it, and the report was adopted by an overwhelming majority.

The London County Council has done its duty, and the danger is averted.

THE annual motor-cycle race meeting of the Automobile Club will be held on Wednesday, the 17th inst.

MR. JAMES WOODROOF, of the Royal Saracen's Head Hotel at Beaconsfield, has been granted a licence by the Beaconsfield District Council to store petrol for the use of motorists.

ON another page we reproduce a photograph of an up-to-date wedding party at Soham, Cambridge. The car used was a M.M.C. Lynton wagonette, belonging to Mr. Mann, of Soham, and the turn-out naturally attracted much attention.

THE newly-formed Birmingham Motor Manufacturing and Supply Company, Limited, has just completed arrangements for the opening of temporary premises at 76, Newhall Street, Birmingham.

A COMPANY has been formed with the object of running a regular service of motor-cars in Tunis. Sousse and Sfax are to be the first points connected, but it is hoped shortly to extend the route to Tunis at the one end and Gabès at the other.

THE Pan-American Exhibition is being boomed in the small cities of the United States by means of motor-cars carrying advance agents distributing souvenirs.

DR. VON STERN, a leading Austrian automobilist, arrived at Berlin on the 27th ult. in his 35 h.p. Mercedes car from Budapest. Accompanied by his wife, he travelled through the Carpathians as far as the Tatra, then through the valley of the River Waag and the Province of Silesia to Berlin.

THE Daimler Motor Company, Ltd., employees' outing on last Saturday proved most enjoyable. About 400 started for London and Portsmouth, one hundred of them breaking their journey at the metropolis. The visit to Portsmouth afforded a most instructive morning's pleasure in the inspection of the dock-yards, which a large proportion of the party made.

A SERIOUS motor-car accident occurred on Wednesday last week between Twyford and Maidenhead. The Hon. Evelyn FitzGerald, son of the late Lord FitzGerald, and the Countess of Rosslyn were being driven in a car along the Bath road when a spoke in a wheel broke. A tire burst and the vehicle completely collapsed. Both occupants, with the driver, were thrown violently out, and the Hon. Evelyn FitzGerald was pinned beneath the body of the vehicle. When extricated some time afterwards, with difficulty, he was found to be badly hurt, and was, with Lady Rosslyn and the driver, conveyed in a lady's victoria to Maidenhead Cottage Hospital. The car was, we understand, the Mors racer used by Levegh in the 1900 races.

A NEW LUNCHEON BASKET.

MESSRS. WARD BROS., Slaney Street, Birmingham, have just placed on the market the "Sirram" tea and luncheon basket, which is neat in appearance, and very compact. The basket contains a provision box, wicker covered flask, enamelled plates, white handle knives and forks, salt jar

and spoon, spirit stove and stand, kettle, tea infuser, spirit tin, tea and sugar tin, enamelled cups and saucers, butter bowl, cream bottle, teaspoons, etc., etc. We understand that the price is moderate, and that baskets can be supplied to suit the convenience of either one, two, three, or four persons.

FURIOUS DRIVING CASES.

AT Cardiff, George Thornton, mechanical engineer, of Battersea, was summoned for driving a motor-car "at a greater speed than reasonable." The Stipendiary, accepting the evidence of the police-officers, found that the car was propelled at double the speed of a trotting horse, or at a rate of ten miles an hour, which he held with great confidence to be an unreasonable and improper, and even dangerous, speed, having regard to the traffic. He imposed a fine of £5 and costs, or one month.

AT Gateshead Police Court, Mr. W. E. Galloway was charged with furiously driving a motor-cycle in High West Street, at 8.55 a.m. on June 6th. Sergeant Wilkinson said that on the morning in question he saw Mr. Galloway in High West Street, near the end of Leopold Street. He was going very quickly, but witness could not form an idea of the speed, as he was not a cyclist. By Mr. Galloway: He appeared to have full control over the machine and to know what he was doing. Witness did not think of stopping him at the moment. Mr. Galloway stated that he had full control over the machine, and could have pulled it up promptly. He might have been going at from ten to fifteen miles an hour, but he did not think it was quicker. The Chairman said the Bench, like Mr. Galloway, were desirous of protecting the public, but having heard the evidence, felt justified in giving the accused the benefit of the doubt and dismissing the case.

AT Carlisle, Edgar Dewar, fruit preserver, of Manchester, was charged with driving a motor-car at an excessive speed on the highway at Stanwix, at 11.35 a.m. on June 9th. Defendant admitted that he was going fourteen miles an hour. P.C. Dickinson deposed that he saw the defendant in Scotland Road at the time named, travelling northwards on a motor-car over twenty miles an hour. Witness was in plain clothes, and shouted to the defendant to stop, but he did not do so. The car returned to the same place slowly at 1 p.m., and he then stopped the defendant, who explained that he did not stop before because he understood witness meant he should slacken speed. For the defence, Mr. D. R. Denard, who was with the defendant, deposed that they went to Gretna and back. They started shortly after 11 a.m., and got back just after 1 p.m. In his opinion they were going from twelve to fourteen miles per hour. They did not stop at Gretna more than three or four minutes, because there was something wrong with the machine. The Bench imposed a fine of 20s. and costs (£2 4s. 6d. altogether).

AT Braintree Petty Sessions, Henry Cooper, of Halstead, was summoned for driving a motor-car at a greater speed than twelve miles an hour, at Bocking, on June 5th. Police-sergeant Clift said defendant was travelling at the rate of eighteen miles an hour through Bocking, whilst Superintendent Terry put the pace at twenty miles an hour. Defendant was fined 5s. and 8s. 6d. costs.

At Broxton, William Watson, of Liverpool, the owner and driver of a motor-car between Chester and Farndon, was summoned for furious driving on the 15th June, at Churton. The Deputy Chief Constable, however, said it was not a very serious case, and he would be willing to withdraw the charge on payment of costs.

At Epping, Lord Carnarvon was summoned for driving a motor-car at a greater speed than twelve miles an hour at Epping on June 22nd. His lordship wrote asking for the case to be adjourned to obtain information for the defence. The application was granted.

At Oxford, Harry Hatton, a driver for the Reading and District Motor Car Co., was summoned for furiously driving a public motor-car in Cornmarket Street on June 8th. He pleaded guilty. P.C. Steele said the defendant drove a motor-car along Cornmarket Street at between eight and ten miles an hour, which was a dangerous rate in Cornmarket on a Saturday night. He had previously cautioned him. Defendant said he had driven motors in different towns for two or three years, and had never been cautioned before. Fined 5s. and 10s. 6d. costs, or seven days.

At Brentwood, Ferdinand Boquet, of Worlingham Hall, Beccles, was summoned for furiously driving a motor-car. The defendant was stopped at Ingatestone through the agency of the police telephone, and had travelled there at the rate of twenty-seven miles an hour. A fine of £3 and 28s. costs was imposed.

At the Worthing Petty Sessions, Harvey Ducros was summoned for driving a motor-car at an unreasonable rate of speed in Chapel Road. Mr. Staplee Firth defended. Arthur Reed said during the afternoon of June 17th he was on the Marine Parade, where he saw a motor-car coming from the east to the west. It was driven by Mr. Ducros, other persons also being in the car. When witness first saw the car it was going at the rate of from sixteen to eighteen miles an hour. The car turned into Bath Place, and almost went on the pavement as it was being driven so fast. Further evidence as to speed having been heard, Captain A. B. S. Fraser stated that on the afternoon of June 17th he was in Chapel Road, about half-way up, when he heard "a tremendous rush," and on looking round saw a motor-car go by. The car ran into a landau which was standing opposite Mr. Southey's shop and overturned it. Defendant then went into the box, and stated that he left Waive's Hotel about 2.30 p.m. on June 17th, and never exceeded a speed of from six to eight miles an hour. If he had been driving along the Marine Parade at fifteen miles an hour, he could never have turned such an angle as Bath Place without going into the houses. In Chapel Road he was still on the first speed of the car, from six to eight miles an hour. George Ducros, brother of the defendant, corroborated the latter's statement as to the speed of the motor-car and the movement of the horse. Mr. Firth, in addressing the Bench on behalf of his client, submitted that the accident could only have been caused in one way, viz., by the horse moving and throwing the front of the landau into the back of the car. The Magistrates retired and were absent twenty-five minutes. On their return, the Chairman said the Bench were equally divided in their opinion, and the case must accordingly be adjourned for four weeks.

At Daventry, Alfred J. Boulton, of New Barnet, was summoned for driving a motor-car at the rate of over fourteen miles an hour at Weedon on June 7th. Defendant did not appear, but his solicitor wrote asking that the case might be taken in his absence, and admitting that defendant was the driver of the car in question. Mr. W. Rhodes, J.P., stated that on June 7th he was driving a pair of cobs to Weedon station, when turning against the barrack gates a motor-car coming from Daventry flashed by. There was no bell or horn sounded. The car must have been going at eighteen or twenty miles an hour. The cobs jumped back, breaking the harness. The driver of the motor-car stopped in Weedon to drop a friend and witness sent to get his name. Superintendent Hustler said that numerous complaints reached him of the rate at which motor-cars were driven in the district. Fined £3 and 13s. costs.

At Lewes, Mr. Mark Mayhew was fined £5, including costs, for driving a motor-car at a speed to the common danger of passengers at Rottingdean. Evidence for the defendant was given by Captain Rawson, late High Sheriff of Sussex.

At Kidderminster, Thomas Smith was charged with driving a motor-cycle on the footpath at Ombersley on June 10th. Defendant pleaded guilty, but said he did it to avoid an accident. Samuel Jones, groom, in the employ of Messrs. Spreckley Bros., said he was driving when he met defendant, who came very fast, and did not pull up in the slightest but went on to the footpath. Frank Boden, who was with defendant, said there were some sharp stones on the road, and they had to go on the path to avoid an accident. The Chairman said the Bench did not wish to discourage the use of motors, but people must learn to drive them properly. Fined £1 and costs, 11s. 6d.

At the West London Police Court, Sir Edgar Vincent appeared to answer a summons charging him with driving a motor-car at a greater speed than twelve miles an hour, "having regard to the traffic." The evidence for the prosecution was that of Police-constable Alker, 517T, who said he saw the motor near Young's Corner in Chiswick being driven by Sir Edgar at "a high rate of speed." He followed behind on a bicycle carrying a speed indicator, which on passing Chiswick Lane registered nineteen miles an hour. In answer to Sir Edgar the constable said there was no approach to an accident. The car was not recklessly driven; indeed, it was skilfully driven. Sir Edgar Vincent gave an account of the journey from Buckingham Gate to Hounslow, and said the speed was at the average rate of ten miles an hour. He was not prepared to

say that the speed at a given time did not exceed twelve miles an hour, but he slowed down whenever it was required. Mr. Lane pointed out that the regulations of the Local Government Board prohibited a speed beyond the rate of twelve miles an hour, having regard to the traffic on the road. No one could help seeing that the speed of motor-cars was greater than twelve miles an hour. However, there had not been any accident in this case, and the car was skilfully driven. He imposed a penalty of £5 with 3s. costs.

At Portsmouth Police Court, on Monday, Mr. J. A. Koosen, of Southsea, was summoned for driving a motor-car at over twelve miles an hour on the evening of June 7th. Mr. Staplee Firth defended. The evidence for the prosecution was given by Detective-constable Wombwell and Police-constable Pinkney, who swore that on the night in question they were on duty in plain clothes, with bicycles, and timed Mr. Koosen from an electric-light column on Clarence Parade to another at the bottom of Nightingale Road, and that he covered this distance in three and a half minutes. That they subsequently measured the distance and found it to be 2,024 yards, which they stated showed a speed of twenty miles an hour (Here a large map was put in illustrating the locality). That they followed and spoke to defendant, whom they alleged to have replied with abusive language. In cross-examination by Mr. Firth they admitted that they had special orders from the chief constable, and further that on meeting with Mr. Koosen they immediately got on their bicycles and followed him, keeping up with him as far as the door of his stable. One admitted to have ridden twenty miles in fifty-four minutes on another occasion, and was asked by defending counsel why he had not locked himself up for scorching. Mr. Firth, for the defence, controverted the evidence of speed, and further strongly animadverted on the practice of chief constables in sending men out on specific errands of this kind. It was not likely they would return empty-handed, and such proceedings tempted them to fabricate evidence. Mr. Koosen was called, and stated that he was not travelling more than eight or nine miles an hour, as the car was out of order, and he was passed by several lady cyclists. He denied the conversation alleged. Mrs. Koosen followed and corroborated defendant's statement, as did also Mr. Oliver. Mr. R. Buttemer was then called, and stated that he was familiar with the car in question, and knew it to be in poor running order at the time. He had tested it that morning, and found it would not run at more than 300 revolutions, giving a maximum speed of 10.02 miles an hour. It was absurd to say it could go at twenty miles an hour; it might have done fourteen or fifteen when in good order. Mr. Firth offered a practical demonstration to the Bench if they cared to have it. The magistrates retired for a brief interval, and on returning said they decided to dismiss the case. Costs were not asked for.

THE CHISWICK FATALITY.

At the inquest held on Mrs. Elizabeth Pearce, who was knocked down and killed at Chiswick by a motor-car belonging to Mr. C. J. Scarisbrick, the evidence showed that the motor was only proceeding at a moderate pace, but that Mrs. Pearce, on alighting from a tram-car, completely lost her presence of mind, and instead of going towards the footpath suddenly stopped and faced the oncoming car. The conductor of the tram said the woman appeared giddy, as if she had been drinking. He tried to stop her stepping off the car, but failed. Instead of going towards the path she seemed confused, and stood still. The motor pulled up in five yards. If the woman had not been carrying a child she could have got to the path in safety. Mr. S. H. Brown, sanitary inspector for Hammersmith, who also witnessed the whole affair, said the motor-car, which was travelling about ten miles an hour, slackened on nearing the tram, and the woman turning round as if nonplussed, was knocked down. The car was stopped within nine feet. It appeared to be perfectly under control, and the accident would not have happened if the woman had not hesitated and seemed to lose herself. Mr. C. J. Scarisbrick, the owner of the motor-car, who expressed deep regret at the accident, said that the speed was seven miles an hour. He was close up when the conductor stepped off with the woman, and as he held her back he let the motor go on. At the time the gas was off and the foot-brake on, and when the woman moved he put the hand-brake on as well. This was the first accident he had had. The jury returned a verdict of accidental death, and added a rider that they considered the woman was sober, but lost her head.

ACTION OVER A MOTOR-CAR.

At Cambridge, the Cambridge and Newmarket Auto-car Company sued Mr. St. Clair Legge, of Southall, for £19, being the balance of the hire of a motor-car as per agreement, and costs of bringing the car to the Company's premises from Southall. Mr. S. J. Miller appeared for the plaintiffs, and Mr. J. F. Symonds for the defendant. George Charles Bedwell, managing director of the Cambridge and Newmarket Autocar Company, stated that defendant hired a car for three months, but subsequently said it was not powerful enough, and another car was accordingly substituted. The plaintiff company fetched the first car at their own cost, as they understood the defendant was about to buy another. He had promised to do so, and it was for this reason they agreed to bring the first car back at their own expense, and not charge him for extra hire. His Honour gave judgment for the amount claimed with costs.

COMMENTS.

MOTORIVE CARRIAGE 1899

WE are glad to learn that a large number of amateurs are entering for the Trials of Reliability to be held in connection with the Glasgow Exhibition, and from the route maps exhibited at the headquarters of the Automobile Club in London, it is clear that the selected routes are through some of the prettiest scenery in Scotland. The entry fee has been reduced to £5 per vehicle if paid before the 1st prox. Those who fulfil all the conditions of the Trial will be awarded official certificates by the Judges' Committee. As, however, there will be several amateurs who will prefer to have only their daily runs from Glasgow recorded, commemorative silver medals will be struck, and these will be awarded to those who carry out the five daily runs. It is to be hoped that all private owners who can possibly participate in these runs will do so, and help to continue the educational work begun by the 1,000-miles Trial.

The Rule as to Speed.

THE rule as to speed in connection with the above runs has been the subject of some discussion. It declares that vehicles will not be permitted to pass certain points before the expiration of a certain period from the time of passing a previous point. We are not in the secrets of the Committee responsible for this regulation, but it is apparently intended to prevent very high speeds. Probably the speed beyond which, in the opinion of the Committee, travelling might be dangerous or inconvenient to the public, will be the speed fixed as the maximum speed to be permitted between point and point. The effect of the rule should be to keep the cars together and to avoid the unexpectedly early arrivals which confused the minds of the spectators in many towns on the route of the 1,000-miles Trial.

Dashwood Hill Trials.

THE hill trials on Dashwood Hill last week were thoroughly successful, and a most enjoyable time was spent by those who took part in the proceedings. The run from London was not over pleasant, for at Uxbridge Road there was a complete blockage of the traffic. At the tramway terminus there were seven or eight electric trams and several market garden carts, and these absolutely prevented progress. The trams started at intervals of about a minute, and travelling about sixteen miles an hour made journeying amongst them and the slow traffic very uncomfortable. The reason so many tram-cars were about was owing to the fact that the company was testing a new line extending to Southall, a distance of eight miles. Beyond Uxbridge, the wind being in our faces, the dust nuisance was very great, a continuous volume whitening and nearly blinding us. The return journey was, however, much more pleasant, a shower having laid the dust.

The Passing of the 6 h.p.

IN a new industry changes must be expected, but sometimes these are too hurriedly made. Our old friend the 6 h.p.—formerly 4½ h.p.—has answered a good purpose, but whether it has achieved that purpose, and is going to be “passed over,” remains to be seen. We cannot conceive that a car that has done the work ours has, that has been used for touring from one end of the kingdom to the other, and that to-day is a better car than the day it was bought can be lightly cast aside. In going to Leicester it travelled over the whole journey from London at an average of eighteen miles an hour. On Saturday last, with five “up,” it did thirty-two miles within the two hours. A pattern and build of car that does that, is reliable, and always certain, and, we maintain, cannot be hastily discarded.

A Hint for County Councillors.

THE “ten miles an hour” County Councillor, who conjures up for himself a vision of the future, when there may possibly be a few automobile accidents to chronicle—there is precious little basis of that kind to go upon at present—should really direct his benevolent (?) activities to something more nearly within his grasp. The mania for “regulations” should find full vent in an endeavour to restrict the use of horses to such an extent that accidents would be impossible. He might suggest as a beginning that horses should never be allowed to trot or gallop; that a man should always walk at the animal's head, in addition to there being a driver; that every horse should be blindfolded when going through traffic, and anything else that is equally calculated to preclude all possibility of an accident to a horse-drawn vehicle. We are bound to admit that no further suggestion occurs to us at the moment, but, so profound is our appreciation of the high order of intelligence which could evolve the “ten miles an hour” proposal for automobiles, that we do not by any means despair of some wonderful conception being forthcoming from that quarter.

What Horses do.

IT can hardly be said that the County Councillor in question would have far to look for object lessons if he once started a crusade against the unconscionable horse, or the incompetency of its driver. One rarely picks up a paper without reading of some accident or other in which a horse-drawn vehicle is concerned. A nice spectacle, for example, that must have been on Ludgate Hill the other day, as reported in the dailies, when a three-horsed dray, loaded with six tons of greens, got out of the driver's control, and overturned itself on top of the animals in the shafts. When the greens and the wagon were cleared from the horses one was found to be dying and the other dead. Something similar we ourselves witnessed in Gray's Inn Road last week, when a whole wagon full of fish was emptied into the roadway, presenting a most curious sight. Then one reads of Lady Walker's carriage accident in Hyde Park. A pair of horses dashed at a furious pace into the park railings and pitched out Lady Walker and a friend. Fortunately they were not seriously

hurt, but the footman sustained a sprained ankle and the coachman concussion of the brain. Again, a brake was overturned at Hampton Court, and several people were injured, and a wagonette disaster was reported from Northampton recently. Nor must it be forgotten that for every recorded incident of this type there are probably several that escape the notice of the press. But the soul of the County Councillor is quite unmoved by catastrophes of this kind.

A Petrol-Motor Street Watering Wagon.

As we mentioned in a recent issue, the Milnes petroleum-spirit lorry, A1 of the Liverpool Trials, was experimentally fitted up as a high-speed street-watering vehicle. By the kindness of one of our subscribers we are able to publish the accompanying illustrations of the lorry. In both pictures the vehicle is shown by the hydrant, from which the

tank is being filled. The experiments proved very successful; with a load of about two tons of water a speed of $7\frac{1}{2}$ miles per hour was maintained. At this speed the water was sprinkled on the road, laying the dust, instead of converting it into the mud which usually marks the passage of the horse-drawn water-cart.

Rule for Horse-drawn Vehicles.

MOTORISTS are a tolerant and patient section of the population, and although opponents of the coming means of locomotion on ordinary roads have made scores of suggestions with regard to the curtailment of their rights, they have not retaliated. But toleration has been regarded in some quarters as weakness, hence the consideration that should be given to the

proposals of those who argue that automobilists should insist on stringent regulations being issued with regard to horse-drawn vehicles. From the University College, Nottingham, Mr. J. Erskine-Murray writes pointing out that if motorists are to stop whenever a nervous driver of a horse demands, it is only proper that the drivers of horse-drawn vehicles should be subject to the same rule. Of course, some will say the idea is preposterous, but they must not overlook the fact that a horse is an animal of uncertain temper, whereas the motor-car is a vehicle whose ways are those of mechanical regularity.

Strain on Drivers.

MANY columns of advice with regard to motor-racing have lately appeared in the papers, and all condemn any suggestion as to high-speed contests being introduced on English roads. Personally, we do not feel that such races are ever likely to take place here, so our contemporaries need not worry. The strain on the riders is too intense to be long endured many times, and only a comparatively few men have a sufficiently strong nervous system to stand it. This fact alone will be enough to threaten the permanence of the sport, and it must not be overlooked that such races as that from Paris to Berlin are exceptional, and not the rule.

The Position of the Arms when Driving.

WHEN Mr. Duryea issued a picture showing a modern lover with one arm round a modern lady, and the other grasping the lever of a motor-car—a picture which was reproduced in the *Motor-Car Journal* at the time—he was apparently anticipating the divided attentions of the Frenchman who appeared in the Brentford Police Court the other day, as fully set forth in our columns this week. A witness testified to the zig zag route taken by the defendant's motor car along a main road. There was nothing wrong with the car, but the driver was doubly engaged, for with his left arm he attempted to steer the car, and with his right he gently inclined a lady, who was by his side, towards him with the view of impressing osculatory affections upon her. But this was not the worst, for the motor-car was driven into a youth who was walking, and the collision was so violent as to project the young lady forward. She lost the guidance of her companion's arm and fell upon the lad in the roadway. The whole incident shows how inadvisable it is to enjoy two pleasures simultaneously. There is a time for everything, and the work of the arms should not be distributed over two objects at once.

Education at Grays.

PASSING through the quiet little town of Grays a contributor to the *Motor-Car Journal* has discovered a rather novel development in the training of horses, which was originated in the Royal stables at Windsor. Mr. Taylor Davies is the manager of the Grays Motor Company, which has its headquarters at the King's Arms Yard, and is just now carrying on a great educational work among the horses of the locality. His plan is to ask horse owners to take their animals for a good drive and then bring them to his yard, where they are given a feed of corn close to a motor-car which is kept in action all the while they are feeding. Every Monday morning, from 8.30 till noon, the motor-car is kept going, and owners can thus get their horses accustomed to the noise of the car.

Drawbacks of the Horse.

IN the course of a recent paper on "The Scope of the Motor-Car Movement," Prof. R. H. Thurston, a well-known American engineer, pointed out that sanitarily, the automobile is a most desirable accession, not simply as removing the horse and his effluvia and excreta from the highway, and thus

providing the assurance of comparatively pure air for the lungs and sweet air for the nostrils, but also as removing the danger—a danger of no small importance—of distribution of noxious elements and malign bacteria through their introduction into foods transported by the present system through our streets and along our highways. Many a mysterious case of illness and many a death have, considers the professor, unquestionably occurred through the importation into the human system of poisonous germs and injurious effluvia, taken in with the food which has traversed the streets exposed to absorption of dust and all impurities, or by the inhalation of the clouds of dust, germ-laden, as they are certain to be, to a greater or less extent, which arise on the highway. In the formation of dust, also, the horse contributes a very large share through the continual trituration of the earth or pavement by his iron-faced hoofs, incorporating with the powder every form of unsanitary matter, organic or inorganic, existing in the road, or flowing or flying over it from neighbouring sources. This consideration is probably of enormously greater importance than is usually supposed or realised.

An Incident of the Big Race.

A MOTOR-CAR is regarded in some quarters as a means of evading wrath to come. In the tourist section of the Paris-Berlin race, however, in one case at least, a gallant *chauffeur* hastened all unconscious to justice. The *chauffeur* in question owed a long-standing account to a German merchant, which the latter had up to the date of the race failed to collect. Like all good Germans the merchant took a keen interest in the contest, the more so when he discovered that his debtor was amongst the starters. Day by day the worthy German followed the course of his long-winded client till he crossed the frontier of the Fatherland. Then did the merchant pounce upon the debtor, armed with power to distraint upon him there and then failing a full discharge of the long-standing account. The account was paid, and the race continued; but at least one competitor learnt the penalty of fame.

Wear and Tear of Roads.

In a paper read by Mr. W. Worby Beaumont, M.I.C.E., at the recent meeting of the Incorporated Association of Municipal and County Engineers at Leicester, the destruction worked upon roads by the iron-shod hoofs of horses rather than by the wheels of the carts which they draw was the theme. It seems that the trotting horse attached to a load of one or two tons is the principal sinner. Sixty per cent. of wear is due to his hoofs, 20 per cent. to the wheels of the vehicle which he draws, and 20 per cent. to atmospheric causes. The more general adoption of motor-cars capable of carrying a load of one to two tons at a speed of eight to twelve miles an hour would, in Mr. Worby Beaumont's opinion, reduce the present wear by something like 30 per cent.—a reduction by which the ratepayer would benefit in a less degree only than the owners of vehicles of all sorts, who would derive a further benefit in the saving afforded to these by well-made and well-kept roads. Dust would, with the general use of the rubber-tired motor-car and better roads, cease to exist, whilst the scavenger would be numbered with the memories of a barbarous past. It is a pleasant vision, nor need one have the gift of prophecy to foresee it, but we fear that few of us of this day will live to see the time when iron-shod horses and steel tires will be the exception, and not the rule of the road.

The Reading Motor-Car Service.

THE Sub-Committee appointed by the Reading Town Council with reference to the licensing of motor-cars has reported that, after much consideration, they recommend that four of the (instead of ten as applied for) of the Reading and District Motor-Car Company and one car of Messrs. Pugh and Strode be licensed, one car of Mr. Pugh having been already licensed. The Sub-Committee added that they deemed it undesirable to license any greater number of cars, having regard more especially to the increased danger which in their opinion would be caused if this means of locomotion should to

any large extent be added to the existing traffic in the streets, and having regard also to the nature of the replies received by the town clerk on the subject from other cities and towns. Mr. Brinn asked what power the Council had to refuse to license motor-cars which were passed as satisfactory for public hire. The Mayor stated that the Watch Committee had absolute power to refuse to license any vehicle they chose; but the reason the Committee came to this decision was because they thought they would try a small number of cars first to see if they were detrimental to public safety. He anticipated that the matter would come up again shortly. Mr. Parfitt characterised the Committee's decision with regard to the motor-cars as being somewhat arbitrary; he was glad to hear that the Watch Committee would have the matter before them again, and thought that possibly they would change their views.

The Lincolnshire Automobile Club.

A MEETING of the Council of the Lincolnshire Automobile Club was held last week, Sir H. B. Bacon, president of the Club, in the chair. Several new members were elected, including Lord Willoughby de Eresby, M.P., Mr. W. E. Foster, and Mr. F. H. Dennis. It was decided to hold Club runs to Grantham, on Bank Holiday; Blankney Show, July 31st; Boston Show, July 24th or 25th; and to accept the invitation of Capt. Laycock, J.P., to Wiseton Hall, for to-day (Saturday). Mr. E. Cragg, M.D., has arranged to give a lecture at Billingborough, on motors of various types, illustrated by lantern slides and specimens of cars. It was decided that the lecture should be under the auspices of the Club, and the hope was expressed that it might be repeated at Lincoln.

THE NEW WINTON 40 H.P. RACING CAR. (See page 366).

Cab v. Car.

A WILD chase took place the other morning on the Thames Embankment, and although we were not eye-witnesses, the circumstantial accounts received give the performance an air of actuality. Mr. Leo Stern, the husband of Madame Suzanne Adams, has a motor-car, and was taking his wife for a drive along Victoria Street when they were espied by Mr. Neil Forsyth, the well-known opera manager. Now it so happened that that gentleman was in a cab intending to see Madame Adams about taking part in an opera owing to the sudden illness of one of the principals. Mr. Forsyth saw the prima donna in the motor-car, but it had passed before he could open up conversation. Instantly he had the cab turned round and gave chase. As luck would have it there was a block in the traffic at Westminster Bridge and the motor-car was overtaken in consequence. When a London cabby overtakes a motor-car, which of the two should be prosecuted for furious driving?

Delays Unnecessary.

DOCTORS have not exhausted their interest in the motor-car, and our medical contemporaries can rely upon several columns of readable matter upon the subject every week. Dr. Edward Phillips, of Coventry, is the latest contributor on the subject, and he confesses he is "thoroughly tired

of the stable and the trouble of horse keeping." Dealing with the suggestion often made that intending automobilists should wait until perfection is attained, he says:—"These remarks seem very sensible; but, whilst waiting for perfection in the cars, are we not wasting our best days, and permitting others to take part in the most fascinating sport and recreation? Should we not take the car of to-day, with all its imperfections, become masters of its faults and vagaries, and have at our disposal a willing 'horse,' capable of making long or short journeys, provided it be kept in proper repair?" This is certainly the attitude that will give greatest satisfaction to the average man and do more than mere dilatoriness to bring nearer the day of perfection. As experiences are accumulated and knowledge grows, manufacturers will be able to produce a car that embodies all the many good qualities that are regarded as essential.

Motorists and the Rates.

SUBJECT to the taxes of the land, and having to pay licence fees, as well as occasionally contribute to the revenue of the legal branch of the Civil Service, motorists ought to think themselves good contributors to the Exchequer. But now comes the suggestion that, because railways bear local burdens so far as their lines run through the areas of county and district authorities, motor-cars should pay something to the rates of the local authorities upon whose highways they run. The idea is a capital one for further harassing the new industry and for increasing the expenditure of local bodies in securing the addition of a few pounds to the rates. Probably the next notion will be that the driver of a motor-car shall pay one shilling to the parish council through whose area he passes. In this way two or three pounds a day could be extracted from the touring motorist, in addition to the sums that the ingenuity of hotel proprietors can persuade from his pocket. The extension of the scope of present annoyances can be made to illimitable lengths—and even then the prejudiced person will not be satisfied. When not quarrelling with motor-cars he will grumble about bath-chairs, perambulators, and less speedy conveyances.

A Pinnacle of Fame.

THE alleged excessive speed of motor-cars, thirty to forty miles an hour round the corners of Piccadilly, is proving a pinnacle of fame up which previous unheard-of M.P.'s vie with one another in the struggle to plant their banner topmost. Quite unconsciously one of these not too well informed gentlemen actually put in a plea for the motorist by asking if the legal speed limit of 14 miles an hour could not be enforced by the police. Mr. Ritchie, who is not given to rash statements, replied that the police made every effort to deal with the matter.

What is Accommodation?

A CASE of considerable interest to inn-keepers, and travellers, too, has recently occupied the attention of the Redhill County Court. The plaintiff had the misfortune to find himself belated with a broken-down motor-car at 1.30 on a wet morning. Accommodation was asked for at an inn at Horley, but refused, on the ground of the inn being full. Plaintiff proposed to pass the rest of the night in the coffee-room, to which mine host would not consent, the result being that the motorist wandered about for several hours in the rain before finding accommodation, and was laid up with rheumatism. Hence the action for £25 damages. Having heard the evidence on both sides, his Honour, Judge Martineau, deferred judgment. Presuming the inn to have been full as far as sleeping accommodation was concerned, the legality of refusing a traveller, well conducted and willing to pay, the right to remain in a public room is doubtful. Whatever the judicial decision may be, we cannot think that mine host has earned for his inn that reputation for hospitality which has for generations been the unchallenged boast of the English hostelry, no matter how lowly.

LONDON TO CANTERBURY.

A BRIEF account of a short run on a York *tonneau* car with 6½ h.p. Aster motor may perhaps be interesting to others who, like myself, attach real value to performances under normal conditions and none to racing or record attempts for advertising purposes only.

With the trusted *mécanicien*, Pugh, at the wheel, and Mr. Smith and myself, with considerable luggage on board, we started at 4 p.m. The traffic at this time (Saturday) was heavy, and some small trouble was experienced with busmen and cab drivers. One of the former, down Camberwell way, blocked us for half a mile, then suddenly pulled up, with us a yard in the rear, without warning. But our alert driver knows the busmen's ways, and a smart appeal to the emergency brakes averted the danger.

Carefully through Lewisham, with always a warning hoot as we approached many restive horses and with a due appreciation of three children in a pony trap, we made our way with never a thought to the engine. This made its presence heard with somewhat unnecessary assertiveness, but this was easy to forgive on account of the splendid way it did its work, and also because when on the second or third speed no vibration was noticeable. All hills, till Gravesend was reached, were taken without effort, the change of speeds being made perfectly, but just how much was due to the excellence of the car and how much to the driver is impossible to say. Probably it was a case of a good car properly managed. Rochester's narrow and tortuous ways were run through as if they were country roads, although crowds of people made them the footways.

Then came the long pull up Chatham hill. Will she take it? "Like a bird!" said Pugh. And so she did. Time, 6.5 p.m. We felt pleased—albeit thirsty—the worst part of the journey without a stop. Then we made the first stop to adjust a valve, but were off again in a few moments. We sped along towards Rainham, making an adjustment of the brake rod whilst travelling, as we were anxious to reach our destination.

Then a glorious run through the hop-fields, keeping to the legal limit except when we couldn't resist the temptation or no policeman appeared in sight. We failed not to give distant warning on approaching the many unattended vehicles we met, but were invariably scowled at and sworn at for our pains. Sittingbourne was well in sight, and the car running so fast that we had to keep well muffled up, when "puncture" shouted a kindly-disposed pedestrian. Yes! sure enough, a back tire was as flat as a pancake! Mr. Smith and I had visions of a night out, but our *mécanicien* was immediately on his mettle. Jacking the car up on a box, the tire was off almost before we had found the repairing kit. Luckily it was a Clipper Michelin. "Not quite a puncture?" said a bystander. Oh, no! only half a ploughman's boot-heel tip actually imbedded in the inner tube. Do not hurry over a repair of this kind. Let it be thoroughly and permanently done, or trouble is bound to ensue. So, taking a full allowance of time, the tire was made equal to new, and running into Sittingbourne we completed the job with Mr. Cleaver's long pump. Time, 8.30. The petrol tank was not empty, but we filled up here to avoid having to do so in the dark. We found we had run forty-six miles on just under two gallons.

Thence a splendid run was made in the gloaming to Canterbury, which was reached at 9.25 p.m. Our net running time was 4 hr. 10 min., and, considering the road, we all felt we had done well. The luggage carried weighed fully 1 cwt., the passengers averaging 10½ stone each. Not a single dismount occurred on any hill, and the nearest approach we had to hurting anything was a bird caught on the radiators. Much unnecessary noise appears to be made by the bonnet. This applies, I believe, to all cars. Probably a seating and lining of felt might be advantageous. C. JENNER.

THE 1901 American Automobile Show is to be held in Madison Square Garden, New York, from November 2 to 8 next. The Show will be held under the auspices of the Automobile Club of America, which, following the example set in this country, has decided to abandon the demonstrating track.

The Paris - Berlin Automobile Race.

BY AUTOMAN.

(Concluded from page 346.)

LAST week I gave the readers of the *Journal* a detailed account of the first day's run and incidents, and a short resume of the completion of the race. I propose to take up my story again at Hanover, at dawn, on Friday, the 28th ult., but before quite bidding adieu to the first lap, reference may be

THE DUKE OF RATIBOR AT BERLIN, WITH THE WREATH FOR THE WINNER.

made to the unpleasant experience which occurred to Schmit, who was acting as *mecanicien* to Mr. Jarrott on his Panhard. Schmit, by the way, is one of the fitters employed by Mr. Jarrott's firm, in London, and is no doubt known to many automobilists. The incident happened when coming round a sharp curve whilst the car was going for all it was worth. Schmidt, unused to the high speeds, flew off the car at right angles to it, landing in the ditch. Fortunately, he fell easily, and, apart from a few slight bruises, came off uninjured. His experience will, however, make him cling on tight in future when rounding corners.

Hanover is quite another style of city to Aix-la-Chapelle. It lies flat, and has large public buildings and broad squares and avenues, and looks solid and wealthy. I did not, however, feel much inclined to study its beauties at six a.m., and I walked over from the station to Kasten's Hotel with M. Falconnet, of Compound tire fame, who had joined the cavalcade by the Nord Express from Paris. I got the last vacant room in the hotel, and went to bed for a couple of hours. The control was fixed about six miles out of the town, so after leaving my card on Herr Tischbein, of the Continental Caoutchouc Company, I hired a carriage and set off with another Press correspondent. After driving for miles and miles, I managed to induce my companion, whose German was more fluent than mine, to cross-question Jehu as to the way he was taking us, and we found, to our surprise and disgust, that the main road had been closed for traffic since the early hours of the morning, and we were going about three miles round. The extraordinary precautions, however, did not end here, for we came to a dead halt in front of a stout policeman, and neither argument, threat, nor the display of official badges could alter his "Nein, nein," and we had to trudge about a mile through the dust and in the hot sun to get to the control.

Thousands of people were already assembled by noon around a triumphal arch consisting of two poles and a piece of calico with the word "Controle" printed on it. There was also a hand stand, a rickety tent on a staging with a table and three chairs for the Press, and two tents for refreshments. This little "camp" was situated at the top of a rise in the middle of a cornfield, with the road from Paris leading up to it and that to Hanover down on the other side.

Round the control was gathered the same party as at Aix-la-Chapelle with the addition of many German automobilists, including the Duke de Ratibor, president of the German Automobile Club, Herr Tischbein, the Mayor of Hanover, and some other notabilities. There was, however, no attempt at any accommodation for the illustrious spectators and we were all huddled in the dust and only protected by our badges from the repeated violent onslaughts of the police commanded by a very irascible officer, who every now and then literally seized an advancing spectator in his arms and flung him into the ditch, till I wondered which was the more dangerous, an automobile at sixty miles an hour or an interview with this zealous official.

But now the telegrams began to roll in. First of all from Cologne at seven a.m. came the news of the arrival of Fournier, followed by Girardot, M. Farman, Voigt, Charron, Pinson, Leys, Lemaitre, Rolls, Degrais. I vainly searched the list for Jarrott and Harry Farman, and at 7.16 the latter was signalled from Cologne and at 7.47 the former. Düsseldorf telegraphed at 7.30 that Girardot held the lead followed by Fournier, one minute after, and then Voigt, Maurice Farman, Pinson, Axt, Lemaitre, Knyff, Harry Farman. Rolls had fallen back at Cologne, one of the supports of his water tank having given way and the tank leaking. Jarrott was busy mending punctures and he had lost an inner tube out of the box at the back of his car and had to do some patching until he could borrow another. Girardot on his light Panhard was improving his position and Antony on the Mors car, which Levegh should have driven, was coming up splendidly. Fournier passed Münster at 10.20 and had regained the lead by 25 minutes. Girardot followed and then came

AFTER THE RACE—AT BERLIN.

(The group includes Prince Frederic Charles of Hohenlohe, Prince Henri of Pless, Captain Laycock, Fournier, and Charron.)

Maurice Farman, Voigt, Knyff, and Antony gaining steadily. Fournier passed Bielefeld at 12.10 leading, and then the telegrams lost their interest and every eye was turned down the road. A few false alarms and then a bugler gave a warning call repeated along the road,

the police rushed about yelling "Zuruck" ("Keep back"), a puff of dust appeared, the crowd separated and in rushed Fournier at 2.13, looking fresh and smiling. The band played a welcome, hands were stretched out to greet him, and I took a snap shot in company with a dozen other amateur and professional photographers. M. Mors looked delighted and there was general enthusiasm all round. Then there was more than a half hour's pause until René de Knyff came dashing up to the control hatless as usual, and with hair and beard simply caked with dust. Two minutes later up came Antony, who certainly made the most remarkable run of the day. Girardot came in two minutes later and then Maurice Farman, Giraud, Chauchard, and Heath. Harry Farman arrived eleventh, and Jarrott, absolutely as black as a coal miner, twentieth. Rolls arrived at 7.5. Louis Renault made a splendid run on his single-cylinder car, reaching Hanover seven minutes before Jarrott.

Whilst I was preparing a telegram in my room in the hotel Jarrott turned up and told me what a bad day he had. At 9.30 we joined the banquet offered to the *chauffeurs* and followers of the race by the Continental Caoutchouc Company, where we met Dr. Lehweß just arrived from London. The banquet was interminable, a speech with every new dish, and it was only attended by a comparatively few *chauffeurs*; the greater part were too fatigued or did not care to come in their working clothes. After the banquet I sat with Mors, Voigt, Maybach, and several others, and turned in at 2 a.m., giving orders to be called at 4.

HOWESTE (PANHARD) REACHED BERLIN.—A NEW POSITION FOR WATER TANKS.

Meantime the tourist section, which I deserted at Reims, on Sunday, June 23rd, had been jogging comfortably along a different route to Berlin without any particularly exciting incidents, receiving wherever they arrived on German soil quite extraordinary receptions. Their cars were filled with flowers; cherries, strawberries, sandwiches, champagne, and even sausages were offered to them every time they stopped anywhere, and in the evenings there were entertainments organised for them, at which the native *Gretchen*s vied with each other for the honour of dancing with a French *chauffeur*. The running of the cars was as regular as in our 1,000-mile Trial, and with a few exceptions the caravan arrived at Potsdam on Friday night, and on Saturday morning drove on to the Berlin West-end Racecourse, there to await the arrival of the racers.

Saturday morning dawned grey and uninviting, and it required a large dose of the sense of duty to get me out of bed to see the start of the last lap, in which 58 cars, "all that were left of the gallant 110," were to make their final struggle for fame. Dr. Lehweß had promised to share a carriage with me to drive out to the start, but I had to use violent means to get him out from between the sheets; however, we arrived at the "park," or tent-like enclosure, where the cars had been stored just at five o'clock, and found outside a crowd of *chauffeurs*, *mécaniciens*, and fitters clamouring for admittance in order to attend to their machines. My official badge enabled me to pass in, where I found the Comte de Chasseloup-Laubat, Baron Molitor, and the indefatigable M. Tampier, the timekeeper of the

A.C.F., who, seeing at Aix-la-Chapelle the weakness and inexperience of the Germans in the matter of chronometers, had followed the race to lend his help, without which there would have been a complete muddle in the matter of records. The poor fellow spent five nights without going to bed. Soon it was time for Fournier and his satellites to come in and get the car ready. Then followed a scene of indescribable excitement. For some reason or other there had been a mistake; his time was up for starting and he was not ready. Fournier danced round his car like a madman, begging his *mécanicien* to start up. Whilst the *mécanicien* was turning the starting handle, a fitter was adjusting the lubricators, another jamming spare tubes into a box at the back, and a third was screwing down the bonnet. With a leap worthy of the "barrel jumper," Fournier sprang into his seat—vrrruun, vrrruun went his engine and he backed out into the main alley, put in his forward gear, and disappeared down the road to Berlin. René de Knyff next attracted attention. A fireman, who was acting as a kind of ticket collector wanted to keep him from entering the "Park," but he did not try it twice. I saw Antony start, and judging from his performance between Aix and Hanover, I thought he might be the winner. Then my time was up and I jumped into a carriage and set off to catch the special train which the Continental Caoutchouc Company had placed at the disposition of the followers of the race, and for which Herr Tischbein had kindly given me a ticket. The special train left at six o'clock, but, as it went by a more direct route than the cars, it was timed to arrive in plenty of time to allow the passengers to see the first of these arrive, and so it turned out, for we reached the racecourse (the Trabrennbahn, Westend) more than an hour before the first car. The course was already crowded with fashionable people, and M. Ernest Cuenod, the President of the Swiss Automobile Club, pointed out to me successively the Duke of Mecklenburg, Prince and Princess Henri of Pless, Prince Frederic Charles of Hohenlohe, the Duke of Ujest, the Duke of Ratibor, the Prince of Thurn and Taxis, Count von Talleyrand-Périgord, Madame Fritz Friedlander, Count and Countess de Moye, Baron Zuylen, and a host of other well-known people. I also saw Messrs. Mors, Darracq, Michelin, Lemoine, Tischbein, Panhard, and a great many other Frenchmen interested in the manufacture of motors and their accessories. The familiar voice of Mr. T. B. Browne also greeted me, and I went off to pay my respects to his charming wife and sister-in-law. I searched vainly for their inevitable Panhard, but learned that they had torn themselves away from it and came by train to Berlin to see the finish of the great race.

The course was kept by a company of soldiers of the Imperial Guard, who joined hands to keep the people back on either side, and it was laughable to watch the strategy employed by the photographers, amateur and otherwise, to dodge the soldiers and, most particularly, the watchful and fussy Count von Talleyrand-Périgord, who was very busy trying to clear the course. Two military bands played at intervals, but gradually, as the telegrams began to arrive, the bands were forgotten, and the excitement began to be intense as Fournier was signalled, first at Brunswick, with Knyff, Girardot, Maurice Farman, and Brasier close after him; next at Magdeburg, with Maurice Farman, Girardot, Knyff, and Brasier following; then at Brandebourg in the same order, except that Maurice Farman has fallen back to the fifth place, till at last came a wire from Potsdam to say that Fournier had passed at 11.5. The excitement then knew no bounds, and we were all on tenter-hooks to see whether Fournier's luck would hold out or a treacherous puncture, or any one of the hundred and one accidents to which all machines are liable, would nip his success in the bud. There were one or two false alarms and then at last, amidst cries of "Achtung, Zuruck," and volleys of cheering in the distance, we saw a little black object turning round the curve of the racecourse. I could only see the front wheels, the radiator, and the curved front axle against a puff of dust. It grew larger and larger, and in a minute had passed the winning post and pulled up dead at 11.46, whilst the band bursts out with the Marseillaise. It was No. 4, Fournier. Then the crowd swayed and surged, and the car seemed swallowed up by a sea of humanity. The

HARRY FARMAN (PANHARD) AT BERLIN.

excitement turned to delirium, a hundred hands were stretched forth to find Fournier's, and an enthusiastic Paris tailor, who had followed the race from Paris, climbed up on the car and kissed his dusty face. Fournier simply beamed with pleasure and looked as fresh as possible, as, loaded with wreaths, he was lifted shoulder high by the crowd, and carried in triumph to the controllers' stand, where he "signed on" for the last time. It was a thrilling moment and one that the spectators are not likely to forget.

After a half hour's pause Girardot arrived and received an ovation. He kept up his reputation as "the eternal second." Twenty-seven minutes later Brasier came in and we had only a minute and a half to greet him, for René de Knyff was close on his heels at 12.34. Then followed Charron at 12.43, with Maurice Farman on board. He had picked him up six miles from the finish, where Farman's car collided with a tourist's which backed across the road in front of him. He was uninjured, but was obliged to abandon the race although so near the end. Harry Farman arrived at 12.47, five minutes after Charron, bringing his brother's *mecanicien*, who was bruised and shaken by the collision. Then came Axt, Houillier, Chauchard, and, at 1.19, Jarrott, who made splendid time from Hanover. Louis Renault arrived less than a minute later, winning the voiturette class, and Osmont, on his tricycle, headed his class, five minutes later, at 1.25. After Heath came Giraud, the winner of the light car class, followed by Werner on the first German car, a Mercedes. He received a special ovation, the band playing the German National Anthem.

There being no news of Rolls, I took a stroll behind the grand stand in search of some lunch, and met Pinson, who told me of his accident at Meiderich on Friday. He had passed Cologne and Dusseldorf fifth, and was traversing a little village on his third speed, when on easily rounding a corner he found himself immediately confronted by an electric tram in the middle of a narrow street and a compact crowd of spectators filling the road on either side of it. He saw at once that he could not pull up in time and must take a header either into the tram or into the crowd, so he jammed both brakes on and steered for the tram, smashing into it and damaging both it and his own car, but getting off with a sprained wrist and injuring no one. A little further on I found Fournier, Charron, and Laycock (the owner of Fournier's winning car), sitting, refreshing themselves, with two or three others. I thought the party would be interesting to the readers of the *Journal*, so, whilst chatting to Fournier, I took a snapshot at them. One of the party whom I did not know came round to my table and I asked him for his name and that of his friend. He wrote in my pocket-book Prince Frederic Charles of Hohenlohe and told me his neighbour was Prince Henri of Pless.

At three o'clock the hooting of the horns from many cars announced that the procession was being made up, and Jarrott kindly invited me to an improvised seat on his car. We started off through the lovely Thiergarten to the Brandenburg Gate, where by special permission from the Kaiser the middle gate was opened to us, and down the famous Unter den Linden, along Friedrichstrasse, and to the Alexander Barracks. All along the way the streets were lined, the balconies and windows crowded, hats and handkerchiefs were waved, and cheers resounded as, after more than thirty years of coldness, the peaceful French invasion of Berlin became an actual fact. A strange incident occurred between Fournier and Girardot. The former broke his chain between the racecourse and Berlin, and it was the luck of the latter, "the eternal second," to lead the racers into Berlin.

The Deutsche Automobil Club had arranged a very complete programme for the entertainment of the visitors, and a little book was handed to each of us with tickets for a dinner on Saturday at the Kaiserhof, a stall at the opera on Sunday, a lunch at the Club on Monday, a steamer trip on the Wannsee, a concert, and a supper. At the dinner four hundred people were assembled, and the healths of the Kaiser, the President of the French Republic, the King of the Belgians, and the other prize-givers were given.

I will conclude my story with a few incidents of the race. Antony started from Hanover classed first for the second day's run, and second only to Fournier in the classification of the two first days, and with a very good chance of winning. Just outside Hanover he got his change-speed lever jammed between two speeds and in his excitement disabled his car and had to abandon the race. Degrais, on his Mercedes, came to grief about twelve miles from Hanover. He was coming to a sharp curve just after Gilles Hourgières and, blinded by the dust, he did not see the turning, but thought he distinguished an avenue between the trees right ahead, and plunged at a terrific speed over the ditch and into a field, where his left wheel caught a tree. Degrais was thrown and only bruised, but his *mecanicien*, who turned out to be his friend and the son of the Austrian Baron Schwetter, was thrown violently against the tree and severely injured. Fortunately the next car to come along was a Brillé in which Dr. Saintau was a passenger, and he attended to the injured man and conveyed him to the hospital in Hanover.

Teste, who was second in the light cars, had two accidents, from which no one but an old tricycle rider ready for any emergency could have recovered. Shortly after starting from Paris he broke his back springs, repaired them again, and came along. This was, however, not the worst; the support of his water tank broke and let one end of the tank down on the ground, where a hole was knocked into it. Nothing daunted, Teste uncoupled the tank, stood it up on the floor of the car, hole upwards, and coupled it up again, and thus he came into Berlin with his *mecanicien* holding the reservoir on and keeping the water from jolting out with his handkerchief. I managed to get a snapshot of the car with the reservoir in its novel position.

Rolls's troubles began at Cologne, and were somewhat similar to Teste's. One support of his tank broke, and then the others gradually gave way. He and young Crompton tied it up with wire, but it bumped on the axle, which knocked holes into it until he only dare go half speed, and then, to add to his miseries, the pin came out of the half-speed gear wheel, and, as he said to me at the dinner at the Kaiserhof, "he felt like doing the next automobile race to Germany in the train." He reached Berlin on Saturday afternoon at 4.47. Rivière, on a Werner bicycle, stuck to it bravely, though he was far behind. He arrived in Berlin in the early hours of Sunday morning, and, finding no control, rode boldly into the barracks of some regiment and got them to take his time. Madame du Gast, the only lady competitor, got through in grand style and was classified.

Forty-seven out of 110 competitors arrived in Berlin. In the heavy-car class there were forty-two starters, twenty-two arrived; in the light-car class there were forty-eight starters, fifteen arrived; in the voiturette class there were eleven starters, six arrived; in the motor-cycle class there were nine starters, four arrived.

Below I give the final classification of the three days' race:—

CLASS A.—HEAVY CARS.

		Total time. h. m.			Total time. h. m.
1.	Fournier	16 5	12.	Voigt	20 39
2.	Girardot	17 7	13.	Lays	21 28
3.	R. de Knyff	17 11	14.	Werner	22 1
4.	Brasier	17 42	15.	Van der Heyden	22 7
5.	H. Farman	18 21	16.	Clément	22 21
6.	Charron	18 51	17.	Lemaitre	23 20
7.	Axt	18 58	18.	Rolls	24 1
8.	C. Jarrott	19 34	19.	Mme. du Gast	26 1
9.	P. Chauchard	19 36	20.	Brillé	29 20
10.	Gilles Hourgières ..	19 38	21.	J. de Crauhez	29 33
11.	E. Heath	19 43	22.	de Turkheim	39 41

CLASS B.—LIGHT CARS.

1.	Giraud	19 51	9.	Mercy	25 49
2.	Teste	22 34	10.	Dernier	27 46
3.	Berteaux	22 35	11.	Haban	31 7
4.	Sincholle	22 46	12.	Collin	33 38
5.	Edmond	23 32	13.	Rigolly	35 58
6.	Kraeutler	25 6	14.	Peschard	37 59
7.	Roland	25 12	15.	Turgan	38 49
8.	J. Gondoin	25 46			

CLASS C.—VOITURETTES.

	Total time.		Total time.
	h. m.		h. m.
1. Louis Renault	19 31	4. Merville	34 31
2. Grüs	22 58	5. Lamy	35 40
3. L. Morin.....	29 7	6. Delisle	37 29

CLASS D.—MOTOR-CYCLES.

1. Osmont	19 15	3. Cormier.....	22 23
2. Bardeau	21 4	4. Bardin	22 38

Fournier wins the Kaiser's Cup, the prizes of the Grand Duke of Luxembourg and of the City of Hanover. Maurice Farman wins King Leopold's Cup for the best time to the Belgian frontier. Giraud wins the prize of the Grand Duke of Mecklenburg. Werner wins the Sèvres Vase of President Loubet for the first German car. L. Renault wins the prize offered by M. Pierre Baudin.

The best times for the whole race irrespective of class are as follows:—

			Hrs.	Mns.	Miles per hour.
Fournier ...	Mors	16	5	44.12
Girardot...	Panhard	...	17	7	43.40
R. de Knyff	do.	...	17	11	43.24
Brasier ...	Mors	17	42	41.97
H. Farman ...	Panhard	...	18	21	40.49
Charron ...	do.	...	18	51	39.41
Axt ...	do.	...	18	58	39.08
Osmont ...	De Dion tricycle	...	19	15	38.59
L. Renault	Renault	...	19	31	38.07
Jarrott ...	Panhard	...	19	34	37.97
Chauchard	do.	...	19	36	37.90
Hourgières	Mors	19	38	37.86
Heath ...	Panhard	...	19	43	37.68
Giraud ...	Light Panhard	...	19	51	37.43

On Sunday next the Yorkshire Automobile Club will hold a run from Bradford to York.

MOTOR-CAR and brake services from Lowestoft into the surrounding districts have again commenced.

THE first of the three large motor-cars built for the Scarborough service is expected at the end of the month or the beginning of August. The other two cars will be ready shortly afterwards.

THE engineering professors and students at the University College, Liverpool, are experimenting with a motor-car on behalf of the Road Traction Committee of the British Association.

A MOTOR-BICYCLE enthusiast writes:—"There is no question of the future of the motor-bicycle. It is a glorious invention, and, once thoroughly understood, there is nothing in the form of a bicycle half so delightful."

C. and A. MUSKER (1901), LIMITED, has been registered, with a capital of £100,000, to acquire the business of C. and A. Musker, Limited (incorporated in 1897), Liverpool, to carry on the business of manufacturers of mechanical, hydraulic, electrical, and other machinery, manufacturers of rolling stock, etc.

WHILST motoring with his wife and another lady, Mr. Summerson, of Darlington, was rounding a dangerous corner near Burdon, on the Saltburn road, when he saw a cyclist coming in the opposite direction on the wrong side of the road. Mr. Summerson steered to the other side to avoid a collision, and the cyclist did the same, the consequence being that both ran into the bank. The motor-car was upset, and its occupants pitched into the road. Fortunately, beyond a severe shaking and a few bruises, they were little the worse.

IN issuing their catalogue and price list, Weston Motors have some strong points to urge in favour of their light steam-cars. Foremost amongst these are noiseless running, absence of vibration and smell, elegance of design, and ease of manipulation. Trouble in starting is reduced to a minimum, a match only being necessary to set the fire going. This done, the car is ready for the road in five minutes, and the fire once set going is regulated from the driver's seat, as is also the supply of fuel and water. Attached to each of the four illustrations of cars contained in the catalogue is a useful specification, giving the length and breadth thereof, as well as height and weight and some interesting particulars of various other important parts.

THE "CHAINLESS" PETROL CAR.

WE are able this week to give an illustration of the new petroleum-spirit motor-car which is being introduced into this country by the Motor Trading Company, of 7, College Chambers, High Holborn, London, W.C. The vehicle is of French construction and is known as the "Chainless." The motive power is supplied by a Buchet double-cylindrical vertical motor of 12 h.p., set under a bonnet in the fore part of the frame. The ignition is electrical, while the cylinders are water jacketed, the circulation being maintained by means of a pump and radiators. Three speeds forward, ranging up to 34 miles per hour, and a reverse motion are fitted, the Panhard system of transmission being adopted. The gear is enclosed in an aluminium case, and there is but one side lever for the various speeds.

From the gear box a universally-jointed shaft conveys the power by means of bevel gearing direct to the rear axle. Ample brake power is provided, the hand-operated brake acting whether the car be running forwards or backwards. The road wheels are of the artillery type, shod with pneumatic tires, and the usual inclined wheel steering is fitted. The car, which is solidly built throughout, weighs complete 12 cwt., and its exceptionally long wheel base—6 ft. 6 in.—ensures stability on the road. Several forms of bodies can be fitted to the car, from the favourite *tonneau*, as illustrated, to the useful delivery van.

A similar car to the above as regards transmission gear, but fitted with an 8 h.p. Abeille governed motor, is also about to be put on the market by the Motor Trading Company.

WE learn that the 200 h.p. "Clarkson" liquid fuel burner, to which reference was recently made in these columns, has successfully passed its official trials, and been accepted by the London County Council.

THE Manchester Wheelers will hold a race meeting on the track at Fallowfield, Manchester, to-day (Saturday). Included in the programme is a motor-cycle competition, in which Mr. S. F. Edge and Mr. C. Jarrott will, it is stated, take part.

ON Thursday last week we formed part of the small audience present at a job-master's in Lamb's Conduit Street, London, W.C., on the occasion of the sale by auction of the 36 h.p. Pennington war motor and some accessories, in connection with the bankruptcy of Messrs. Pennington and Baines. The curious-looking vehicle, of which such great things were expected, failed to attract a large number of bidders, and although it was said to have cost £2,000 was knocked down for £100 to Mr. Shacklock, of Wolverhampton, late manager of the Humber cycle factory—now closed—in that town.

AN ELECTRICAL VEHICLE'S LONG DISTANCE RUNS.

THE British and Foreign Electrical Vehicle Company lately arranged a series of trial runs to demonstrate the practicability of electric cars. It is evident that the experience of the Chislehurst trials has been put to some use during the time that has elapsed since that competition, and the company's new car is certainly a great advance upon the "Powerful," both in respect to design and capabilities. The design of the body has been radically altered and instead of the two tiers of accumulators, with a driver perched on top of them with a single companion, we now see a graceful, boat-like body, with the accumulators arranged on one level and dispersed in two boxes, to give the least appearance of bulkiness. The number of the cells has been reduced from sixty to fifty, and a seat for two more passengers has been arranged behind the driver's seat and raised so that its occupants have a full view of the road over the driver's head.

The new car opened its career by demonstrating to the County Councillors the advantages of automobilism, and it was much admired at Sheen House, not only by the County Councillors, but what is perhaps of more importance to the company, the automobilists who were present on that occasion. On the 11th ult. the car made its first trial trip for a long

journey, and, as already reported, successfully covered 94½ miles, running throughout at an average speed of twelve miles an hour. This, we believe, constitutes a record distance for an electric car upon one charge of its batteries, since it beats the distance accomplished by M. Krieger, who recently covered eighty-nine miles. Since this date a number of runs have been made with a view to testing the running of the car over general average roads in the home counties. Perhaps the most trying run was made about ten days ago. The following is an account given us by one of the passengers on that occasion:—"At half-past ten we started from Northumberland Avenue with the intention of lunching at the 'Compleat Angler' at Great Marlow, if nothing happened by way of accident to prevent us. It was a pity that we did not know of the chaotic state of the Uxbridge Road. For some miles the permanent way for the new electric trams is in course of construction, and the road was a succession of pits and mountains, which tried the car most severely. However, the dead weight of the accumulators and the great length of the car kept her wonderfully steady. About twelve miles from the Marble Arch matters improved, and higher speeds could be used without constantly cutting the current and applying the brakes.

"After passing Gerrard's Cross and Beaconsfield, we took a sharp turn to the left, and before we had any warning we were sliding down a steep hill of about 1 in 10 with an atrocious

surface of loose flints and an ugly-looking ditch at one side. Not twenty yards of that hill went in the same direction, and here the guidance of a two-ton weight on wheels became a work of art. The value of the recuperation became evident, not so much on account of its putting back energy into the cells, but rather for its perfect braking action. The view across the Thames Valley was superb, but as the hill increased in steepness and the road narrowed to nearly the width of the car, and twisted and turned like a snake, one lost interest in the view, and began to wonder what would happen if the car drove through the hedge, and the other side happened to be hard ground. Just then a friendly cyclist pushing his machine up the hill, cried out to us as we slid past him that there was a dog-cart across the road lower down. The switch was thrown back quickly to the electric brake. The motors were short-circuited, and with the application of the foot-brake we came to a stop within a distance equal to the length of the car. With two wheels in the ditch we crawled by the dog-cart which monopolised the roadway, and most of us were not sorry when the valley below was reached.

"At the Compleat Angler, at Great Marlow, the white electric car created great interest. No one would believe it had come from town. 'Electric cars are only good for wood-paving and asphalt, and twenty miles on one charge.' 'How did you get here?' were the general remarks. 'How are you going to get up the Bisham hill?' was however the more interesting question to us, and after the best served lunch to be had in the Thames Valley we started to consider the matter experimentally. It is a long pull up the Bisham hill and calculated to try most motors and batteries. Sixty amperes to climb it at eight miles an hour on the fourth speed proved most economical. On only one short stretch of the hill where the gradient touched 1 in 8 did the ammeter read over sixty, and then the motors gave a dull note and braced themselves to the work, and our two tons steadily and deliberately forged upwards. Then, as the crown was reached, they gave a sigh of relief as their speed increased, and the ammeter reading fell back to the normal thirty. A more satisfactory test could hardly have been applied. The back of the journey had been broken and still the batteries gave close on two volts per cell on load, and we knew that the thirty odd miles home was an easy task to perform. The only incident on the return journey was the picking up of a 3in. nail by one of the back tires, which necessitated a visit to a coachbuilder's yard to repair the puncture, and at seven o'clock we were again in Northumberland Avenue, having completed about seventy-five miles of average road."

We understand that several runs varying from seventy to ninety miles have since been made under all sorts of conditions, and the only trial remaining to finally demonstrate the value of the electric car for general purposes is a thousand mile run through England, taking towns with charging stations every seventy-five or eighty miles. The British and Foreign Electrical Vehicle Company have, we hear, such a test under consideration and the result will be watched with considerable interest. The cost of the charge for each run of, say, ninety miles, is, we are informed, 6s. 3d., which works out at about ¾d. per car mile, a reasonable rate when the comfort and ease of the travelling is taken into consideration.

THE Motor-car service which has been established between Bromley and Biggin Hill, Cudham, Kent, by the owner of the Aperfield Court building estate, Mr. F. H. Dougal, is proving very popular, and considerable numbers are daily availing themselves of the opportunity which is thus provided of "motoring" out to what is undoubtedly one of the most delightful and most salubrious parts of the district. The vehicle is a large one, and invariably carries its full complement of nine passengers. The "going" is exceedingly pleasant and comfortable. The object of the vehicle is, of course, to bring still more prominently before the notice of the public the claims of the Aperfield Court estate as a desirable investment, and already the owner has found this object is being achieved.

THE AUTOMOBILE CLUB'S HILL-CLIMBING TRIAL.

DASHWOOD HILL, on the Oxford Road, was again the scene, on Saturday, of a hill-climbing trial promoted by the Automobile Club. Whereas, however, the previous trial on May 2nd was confined to members, the present event

Thick dust was the chief accompaniment of the outward journey, and the rear occupants of low cars with *tonneau* bodies had had enough to invest them with an appearance of premature age by the time they reached High Wycombe and halted at the Red Lion, or proceeded straight to the foot of the hill, four miles beyond. Some inconvenience was also caused by the presence on the road between Hanwell and Uxbridge of a number of new

SNAPSHOTS AT DASHWOOD HILL.

was open to all comers; it was also a hill climb pure and simple, there being no tests of petrol consumption, and no non-stop runs. Though it was expected to be a somewhat quiet event, there was a fair number of entries and a goodly muster of non-competing cars, whose occupants had come to enjoy the luxury of seeing the competitors struggling up the hill.

electric trams, indulging in preliminary canthers, minus passengers, in view of the opening of the line four days later.

The competitions were timed to start at 5 o'clock, but Mr. C. Johnson, the Club Secretary, drove down earlier in the day in order to make the necessary measurements and post the flags. With him in his Darracq were Mr. W. Worby Beaumont,

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

Mr. R. B. B. Bruce, and Mr. C. L. Freeston. Among other cars which were in the yard of the Red Lion in the early afternoon were the splendid new 16 h.p. Daimler, driven by Mr. J. S. Critchley, with Messrs. Cordingley and Stanley Spooner as passengers, Mr. C. Cordingley's 6 h.p. M.M.C. Panhard, with Mrs. Cordingley and Miss Purchasehouse, Mr. R. E. Phillips's new 12 h.p. chainless, and Mr. Mark Mayhew's 7 h.p. Panhard. Until it was known that the big Daimler was a 16 h.p., and not a 12 h.p., it appeared likely that the light Chainless would make the fastest time up Dashwood, as it has almost a voiturette body, and none would suspect that so powerful a motor was fixed beneath its bonnet. Later on, however, the presence of the 50 h.p. Napier made itself felt, or rather heard, in the neighbourhood, and there was no longer room for speculation as to who would mount the hill in speediest fashion.

Clustered at the foot of the hill, or driving to and fro, the following cars were to be noted, irrespective of those in the list of competitors hereafter enumerated:—Mr. Noel B. Kencaly's 10 h.p. Delahaye, Dr. R. Horner Wyeth's 6 h.p. Boyer, Mr. Montague Napier's 3½ h.p. Renault, Mr. T. B. Browne's 6 h.p. Panhard, Mr. J. Allen's 6 h.p. Daimler, driven by Mrs. Allen, who is now an accomplished *chauffeuse*, Mr. F. Howard Mercer's 5 h.p. Peugeot, Mr. W. H. Astell's 7 h.p. New Orleans with *tonneau* body, Mr. Billing's 4½ h.p. Clement Panhard, Mr. C. W. Brown's Pieper, Mr. Lyons Sampson's Benz, Mr. Illingworth's "Torpedo," an Orient Express, Mr. E. de Wilton's Ariel tricycle, Mr. E. Baynes's 6 h.p. Mors, Mr. Walter Munn's De Dion voiturette, Mr. Cecil Edge's De Dion voiturette, Mr. Cheel's Ariel tricycle and trailer, and Mr. A. Heard's Century tandem. The latter was entered for trial but arrived too late, owing to tire trouble on the way down.

As for the competing cars, they were as follows, the selling prices and other details being also appended:—

1. Mr. C. Friswell's 7 h.p. Peugeot (two cylinders); driven by the owner. Price £400. Two passengers.
2. Mr. Owen O'Connor's 7 h.p. Peugeot (two cylinders). £400. Two passengers.
3. Mr. A. E. Cohen's Weston Motor (steam, two cylinders), 5.7 h.p.; driven by the owner. Price £180. Two passengers.
4. Roadway Autocar Company's 4½ h.p. Renault (one cylinder); driven by A. Bushell. Price £250. Three passengers.
5. Mr. Roger H. Fuller's 4½ h.p. De Dion (one cylinder); driven by the owner. Price £250. Two passengers.
6. Mr. R. E. Phillips's 12 h.p. Chainless (two cylinders); driven by Mr. W. H. Kitto. Price £272. Two passengers.
7. Mr. Mark Mayhew's 7 h.p. Panhard and Levassor (two cylinders); driven by the owner. Price £436. Four passengers.
8. Mr. S. F. Edge's 50 h.p. Napier (four cylinders); driven by the owner. Price £1,500. Two passengers.
9. Daimler Motor Company's 16 h.p. car (four cylinders); driven by Mr. J. S. Critchley. Price £1,150. Four passengers.
10. Locomobile Company of America's steam car (two cylinders), 5½ h.p.; driven by A. Ginder. Price £190. Two passengers.
11. 8 h.p. Panhard and Levassor (four cylinders); driven by Mr. J. Lawson. Price £710. Four passengers.

Commendable punctuality was observed, Mr. Johnson, who was assisted by Mr. Lyons Sampson and Mr. R. E. Phillips, getting the first car away at five o'clock, the others being despatched at brief intervals. Mr. Phillips "clocked" at the starting point, and Mr. Worby Beaumont and Mr. C. L. Freeston at the finishing line, which was indicated by two flags set 120 yards to the north-east of the bench mark on the gate-post. The total rise which the cars had to make was one of 219 feet in 3,350 feet, the average gradient being 1 in 15.3, out of which, however, 1,110 feet had an average of 1 in 10.37. It may be said that the hill looked particularly tough to tackle on Saturday, its white surface being thrown up into strong relief under the blazing sun, and seeming to intensify the steepness of the ascent. Ploughed, moreover, into ruts and rubble by the skids of descending carts and coaches, its condition was vile in the extreme, and it was deplorable to see a main road so mauled and mangled.

Nevertheless, the cars made excellent ascents, and even the

least powerful of the eleven displayed its conspicuous superiority over the horse. Each car had to make three separate ascents, and the figures given below represent the mean time in each case. As no speeds in excess of the legal twelve were officially recognised, the actual capabilities of those exceeding that figure cannot be indicated:—

No. 8. Napier ...	12 miles per hour.
No. 10. Locomobile ...	12 "
No. 9. Daimler ...	12 "
No. 6. Chainless ...	12 "
No. 3. Weston ...	12 "
No. 1. Peugeot ...	10.5 "
No. 11 8 h.p. Panhard ...	10.1 "
No. 7 7 h.p. Panhard ...	10 "
No. 5 De Dion ...	8.9 "
No. 4. Renault ...	6.3 "

The average of No. 2 car is not given, as on the third ascent it had to stop to adjust an exhaust spring. It should be added that only standing starts were allowed, but the steam cars were permitted to get up full steam.

MR. H. W. WHIPPLE, of the Automobile Club of America, has ordered a 25 horse-power Napier car.

MR. KEARTLAND MOLE, of St. George's Crescent, Liverpool, is using a motor-car for the collection of strawberries and conveying the same to market.

THE Postmaster of Worcester, Mass., has petitioned the United States Post Office Department for motor vehicles to be used by the mounted letter carriers.

MESSRS. CHARRON, GIRARDOT, and VOIGT, of Paris, have now opened an American branch at 133, West 38th Street, New York, for the sale of Panhard and Mors cars.

THE Automobile Club of America is reported to be contemplating an alliance of all Automobile Clubs in the United States, with a view to placing the New York organisation on a better footing to guard the rights of automobilists throughout America.

AN experimental run of a motor-car manufactured in Brisbane, Australia, took place recently. The design is that of a four-wheel dogcart, with capacity for four passengers. The propelling power is derived from petrol ignited electrically. The engines develop 5 h.p., and are capable of propelling the vehicle on an average road at from ten to fifteen miles per hour. The car has been constructed by Messrs. Trackson Brothers, Limited, electrical engineers, of Brisbane.

THE Winton Motor Carriage Company, of Cleveland, Ohio, are now building some heavy racing carriages. The engine, which is said to develop 40 horse-power, has two horizontal opposed cylinders, with connecting rods working on cranks set at 180°. It is located under the seat and footboard on the left side of the body. The crank pit is enclosed, and the splash method of lubrication is used. The transmission gear is also enclosed in a tight metal casing, and runs in oil. It is of their usual type, giving two speeds forward and a reverse, and controlled by the usual two levers at the side of the driver. When running on the high gear, a sliding handle on the steering head allows of throwing out all the gears and driving direct from the engine shaft to the rear axle. The regular system of speed control of the engine is employed, but another handle at the front of the seat permits of the adjustment of the speed at any point, while the engine is running "on the governor." The low, plough-shaped front of the body, which is entirely open at the front, contains the copper radiating coils with flanges, and the water tank. The water circulation is maintained by a centrifugal pump. The car has a frame of channel iron, and 36-inch wheels, with 4-inch pneumatic tires. The body is a six passenger tonneau, but the rear part, which carries the tonneau seats, can be removed. The car weighs about 22 cwt. The engine can be run from 150 to 1,100 revolutions a minute, and at the latter speed the car is said to be geared to attain a speed of 83 miles an hour.

CORRESPONDENCE.

THE SPRAG DIFFICULTY AGAIN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Under the above heading I read in your issue of June 22nd a letter from Mr. Thatcher on this important subject. In your issue of June 29th, Mr. Nixon very kindly suggests a remedy, which although perhaps effective on some cars would be quite useless in the case of a heavy car of the Daimler wagonette type. As every motorist is aware, these cars are fitted with a very powerful hand-brake, gripping the drum on the counter-shaft, but should the running back on a hill be caused through a chain breaking or coming off—which was my own experience—the road wheels are quite free of this brake or the gears, and with the exception of the tire brake, which, on a steep gradient, would seldom hold the car, nothing can prevent running back and its sometimes awful consequences. Acquiring this knowledge by personal experience, I cast about for a reliable remedy, and have just perfected an appliance which will hold a car weighing 25 cwt. with eight up, on a gradient of 1 in 9, without the assistance of the ordinary brakes with which the car is fitted. It is applied instantaneously from the driver's seat, can be made in sizes to fit any car, and weighs only a few pounds. It is my intention to patent it and place it on the market, when I am sure it will be in immediate demand. Unfortunately I am at present hindered by want of capital, and should be obliged if, through the medium of your columns, any of your readers could assist me.—Yours faithfully,

CHAUFFEUR.

MOTOR-CAR MISHAP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My attention has been drawn to the current report of a so-called motor-car accident at Newport, Mon. I think it only right that the real facts of the case should be known. It is stated that my car collapsed. Nothing of the kind happened, and the entire fault was on the part of a haulier with a load of pipes, who acted in a very stupid manner. He was going down Commercial Street, Newport, on the tram-line, and when my car caught him up my driver turned it into the side of the road, so as to pass his cart, when he, instead of either keeping straight on or turning to his left, turned his horse to his right (his wrong side), thus bringing it across the front of the motor-car. Had it not been for the quickness and presence of mind of my driver, a most experienced man, who reversed very sharply, and turned the motor-car up into Palmyra Place, there would have been a collision. All that occurred was that the sudden reversing stripped the teeth off a small pinion that drives on to the hind wheel; therefore, the car could not go on.

If I had been driving a horse and carriage instead of the motor-car, and the haulier had acted as he did in this instance, there would inevitably have been a very serious accident, as it would have been impossible to pull up the horse so suddenly as the motor-car, and it would have been entirely the result of the haulier's carelessness and stupidity in drawing right across on his wrong side as he did.—Yours truly,

CHARLES D. PHILLIPS.

THE PARIS-BERLIN RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a great deal of interest has been taken in the English car which I drove in the Paris-Berlin Race, I would ask you to allow me to state the circumstances which caused my retirement. The car throughout went absolutely perfectly, and prior to my first puncture I drew up from twenty-fifth position, at which I started, to ninth in the first seventy-eight kilometres. After this, however, my Continental tires punctured no less than seven times, but my final accident, which put me out of the race, was caused when passing another competitor. Being unable to see for the enormous cloud of dust, I struck the arched curve of the road over a small bridge while travelling at about seventy miles an hour, the result being that the car leaped into the air,

and struck the ground again with such violence as to break my back carriage spring. Until a new one was made, which took two days, it was impossible to continue.

It will thus be perceived that my want of success was in no way attributable to any fault in the power or construction of the car. All other competing manufacturers had many cars entered, and every manufacturer had cars broken down, but as I only had one string to my bow, my chance at any time under such circumstances was doubtful.—Yours truly,

S. F. EDGE.

THE 70 H.P. NAPIER CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your last issue Mr. Edge surpasses himself in forgetting what he writes. If, however, he will refer to your esteemed contemporary, he will find that on April 27th I asked his permission to advertise a challenge in *Le Velo*, pointing out to him that the wonderful challenges that he was issuing to Mr. Hutton were of very little use to uphold his claims as to the superiority of the Napier car over any other. On May 4th and later Mr. Edge told me that I could make any challenges I liked on his behalf. Before such evidence, which is still in print, naturally, Mr. Edge should at once admit that his letter to you is a mistake. Besides, what does it matter? Mr. Edge has made some wonderful challenges. I have helped him, and have been successful enough for Mr. Maurice Farman to take up the challenge, and now, seemingly, Mr. Edge wishes to climb down. If he does, and does not agree to race Mr. Maurice Farman, your readers will know how to judge his challenges in the future.

I might mention before concluding that Mr. Edge, in reply to my letter in *Le Velo*, has stated that I am attempting to make out that I am connected in business with him, so as to be able to sell cars in this country. I appeal to your readers, as to whether they have ever heard anything so ridiculous or so unjust. In his remarks Mr. Edge is, I consider, sailing very close to the wind, and had he dared to have put it into print in an English paper he would certainly have had to answer for it. I regret that Mr. Edge has so far forgotten himself as to have written in such a strain in a French paper.—Yours faithfully,

D. M. WEIGEL.

Mr. Jarrott writes:—"I notice in last week's issue that your correspondent, "Flaneur," is inclined to poke fun at the *Daily Express* and other journals for referring to the fact that the garments worn by the competitors in the Paris-Berlin race were oilskin. He further points out that the garments in question were made of leather. In justice to the correspondents of the papers in question, however, I would point out that nine out of every ten of the competitors wore oilskins and not leather. I myself wore oilskins, and nearly all the other competitors did likewise. Leather is useless in regard to rain, and the possibilities of a wet journey sufficiently induced most of us to don oilskins in preference to leather garments."

"MOTORIST" writes:—"Flaneur" is mistaken as to an "exhausted" valve never having been heard of before. About two years ago Mr. John Stirling, of Hamilton, discovered one on the well-known Pennington car, but he omitted to say whether the poor thing was revived by a "drop of Scotch."

Two of the leading motorists in Italy have started a movement in favour of the establishment of a motor-racing track, three miles round, in the town of Padua.

MESSRS. FRANK WELLINGTON, Limited, of 39, St. George's Square, Regent's Park Road, inform us that they undertake to repair sparking plugs provided by them free of cost if broken within a month of delivery through faulty manufacture.

MR. PERCY RUSSELL, of Trent Road, Brixton Hill, is a poet—and liberally avails himself of poetic license. A four-line verse by him in the *Daily News* says that the modern motorist "murders children—just to win a race." Probably, if "suburban poets" were substituted for "children" the sympathy of the whole world would go out to motorists as deliverers.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

THE PARIS-BERLIN RACE.

THE HON. C. S. ROLLS'S EXPERIENCES.

FROM the particulars with which the Hon. C. S. Rolls has furnished us, it would appear that but for one source of trouble, which was unfortunately a constant factor, his chances in the race would have been exceedingly good, as he had no punctures on the first day, only one on the second, and three on the third, and few minor annoyances.

The Mors car which Mr. Rolls drove was only properly finished at 11 p.m. the night before the start, which barely gave him and his *fidus Achates*, Mr. Claud Crompton, who accompanied him as amateur mechanic, time to get up to Champigny and find their place at the point of departure. Owing to the enormous number of motor vehicles of every sort rushing along in one direction to take up positions in the road and watch the passing of the racers, so continuous was the stream of motor traffic that, when they overshot the mark, they were unable for a considerable time to turn round until they got a number of men with lanterns to stand in the middle of the road and stop the oncoming cars. No accidents occurred, however, at this juncture owing to the excellent police arrangements. Fires were lit along the sides of the road, and Mr. Rolls bears testimony to the wonderful picturesqueness of the sight as countless types of cars and cycles with Japanese lanterns sped along through the night, many with their exhaust boxes detached to gain an extra foot an hour. He and Mr. Crompton could scarcely tear themselves

THE HON. C. S. ROLLS' LATEST MORS RACER.

away to get an hour's sleep in a hay loft. Duly awakened at 3.15, they clambered down the ladder, mounted their car, moved into line, and awaited the start.

Soon after leaving the first control they struck some ideal strips of road and passed some five or six cars in the first few miles. Before very long, however, they heard a cylinder missing. Without slowing down Mr. Crompton changed the coils, but to no effect. He then took out and replaced the *inflammateur* on the cylinder, a difficult feat *en plein vitesse*, and giving him, as he said, "seven hundred shocks a minute to stimulate him." Being still unable, however, to get the fourth cylinder to work they decided to continue on three to the next control. Two or three cars had meanwhile passed them, and when they reached Montmirail another thirty-five minutes was lost in the control while the Mors men took out the induction valve, sparking maker, carburettor, etc., only to find that an exhaust spring had jumped out. This was most annoying, as it was one of the first things Mr. Rolls had looked for, but the hook of the spring had become displaced in such a manner that the latter appeared to be perfectly in its place, and the valve seemed to be working up and down all right. This was rectified in one minute, and they proceeded on their way.

From that time onwards, however, the car ran in a most wonderful way, and caught up many others. No punctures occurred, though a number of times it was necessary to stop to to extract nails felt in the tires whilst travelling. The exhaust spring also jumped out again twice. The car

arrived at Aix-la-Chapelle in excellent time, and had done so well that it looked like securing a good position. On the following day, however, exceeding ill-fortune awaited them. They encountered many miles of atrocious *pave*, and over this, being determined to save his car, Mr. Rolls drove very quietly, and allowed several slower ones to pass.

In spite of this precaution, however, a grave state of things was discovered on entering Cologne. One of the iron brackets supporting the water tank, having a flaw at the bolt hole, broke off, and allowed the tank to drop on to the back axle, the effect being to batter a number of holes in the tank and loosen the seams. This, as Mr. Rolls says, was a heartrending situation, as they had apparently got up to somewhere about seventh place according to classification. He felt like giving up the race, as the tank seemed irreparable, but Crompton, resembling his father, Col. Crompton, R.E., in knowing no difficulty, determined to make a shot at repairing. First of all they took off the back of the car, opened up the manhole of the tank, and, with great difficulty, stopped up the holes with grease and canvas from the inside, by means of which they succeeded in getting the lower part of the tank to hold water with only a slight leaking.

They then procured some strong iron wire and bound the tank up to bits of wood projecting from the frame and attached it as best they could, and after this made up their minds to crawl into Dusseldorf, the next control, where a Mors *dépôt* was established. The men there, however, practically refused to help with the tank, saying that it was impossible to proceed, and recommending Messrs. Rolls and Crompton to relinquish the race and wait for a new tank from Paris. Rather than do this they plugged steadily along, frequently repairing the interior of the tank, and patching it up—an unpleasant job, for now and then it would suddenly begin to lose its water from the canvas and grease shifting inside. Crompton nobly plunged his hand each time into the nearly boiling water to fill up the holes with more grease, in the hope of saving enough water in the bottom of the tank to run them to the next control.

When they had good surfaces they could go at full speed, but as practically the whole length of the route comprises a villainous road with frequent *caniveaux* and level crossings, they did not dare to go beyond the third speed, and generally were on the second. They got to Hanover, of course, very late, and were much congratulated by their French friends who had seen their apparently hopeless breakdown at Cologne, and were much surprised at the arrival of the car. Having only one and a quarter hour allowed for repairs at Hanover, nothing could be done but remake the wire-attachment to the tank, which had now broken the second bracket, leaving all the strain on the wire. They took an extra hour out of their running time, and made a better job of the attachment than on the previous day, although the Mors men again discouraged them from attempting to run to Berlin with a large water-tank which leaked everywhere, and was only suspended by a few bits of wire attached to thin pieces of wood.

On the final stage of the journey, besides starting very late, they had three punctures, and what with the ceaseless trouble caused by the water-tank and the dread of losing it over the rough surface, they were very thankful when Berlin was reached five hours after the first arrival. So tired were they that during the three following days they fell asleep at all times, whether at meals, in a cab, or at the opera, while Mr. Rolls developed a new-found propensity of talking in his sleep. When the car was in the Exhibition, the repairs due to the ingenuity of Mr. Crompton were the cause of no little curiosity, and the members of the Mors firm expressed their hearty thanks for the trouble and determination the two young Englishmen had displayed.

Mr. Rolls considers that a race of this sort is almost entirely a matter of luck, given equal cars, Fournier having better luck in both his races than anybody else. He had a great advantage, moreover, in being an early starter, and so avoiding the blinding clouds of dust which other competitors in the rear had to face. Having got up from thirty-third to about seventh during the first half of the journey, Mr. Rolls was told that he must have been one of the first three but for the tank, as two or three competitors who were in front when

the accident happened never got through at all. It was with no little surprise, however, that after having spent four hours stationary on the road, and run the 420 miles from Cologne to Berlin at half speed, Mr. Rolls learned that after all he was classed eighteenth out of 110 starters.

The reception given to the competitors in Belgium and Germany was wonderfully good. At every control bouquets of flowers by the dozen were thrown to them, many of these with cards attached, and glasses of champagne were often offered, together with other drinkables and eatables. At many of the controls there was a band, which struck up on the arrival of each car, and miles of road were lined by cavalry and infantry. Every dangerous or awkward place, whether *cavireau*, level crossing, or corner, was marked by a man with a flag standing some distance beforehand. The organisation throughout, says Mr. Rolls, was, in fact, excellent.

The times given in the *Auto-Velo* indicate that over certain stretches of the road he maintained an average of about sixty-three miles an hour, and occasionally did the third fastest time between controls. Single kilometres, however, were clocked in thirty-two seconds, which is the test speed the Mors cars have to attain on the level before being passed by the makers.

THE KELLY GENERATOR AND BURNER FOR LIGHT STEAM CARS.

NOW that light steam cars are becoming popular it is only natural that inventors should be giving attention to improved details. This is particularly the case with regard to burners, or "the fire," as it is termed, quite a number of improved forms of which have lately been brought out. One of these is the Kelly, made by a Cleveland firm, and which is being introduced into this country by the New York Tire Company, of Thavies' Inn, London, E.C. Figs. 1 and 2 show the generator, which is independent of, but generates gas for the main burner quickly. Fig. 2 shows the device with the outside casing removed. In attaching to the boiler burner the orifice D must centre with the mixing tube of the burner. The union joint A is screwed on to the supply pipe, which must be of the right length to allow the outside generator casing to fit close to the burner casing. B is the deflector plate which carries the sub-flame, and C is sub-flame tube. After the generator has been thoroughly heated it carries and keeps the flame over the main burner, which it lights, when the main valve G is opened. A drip-cup I is first filled and does the first lighting. M is the overflow and lighting point after the drip-cup fills. E is the check and is intended only to prevent the possible turning of the sub-flame valve F, when in motion. The

FIG. 1.

sub-flame valve F is, first, for turning on of the fluid in the cup, and afterwards for regulating the sub-flame. G is the main valve stem, by means of which the fire can be controlled from the driver's seat. H is the opening in which the diaphragm, which is drilled and seated for same, is to be screwed. The generator replaces the torch usually employed and from the time the match is applied to the generator, the main valve at the seat

can be turned on in four minutes with a full fire under the boiler from the main burner.

FIG. 2.

Fig. 3 shows the new one-piece cast-iron burner for steam boilers. One of the drawbacks of the steel shell burner with the tubes swedged through is the warping of the plates and

FIG. 3.

leakage around the air holes, owing to the heat. With the new burner it is claimed that there is no possibility of warpage or giving around the air vents.

MESSRS. A. B. WARDMAN AND SON, of 17, Regent's Parade, High Harrogate, stock Carless Capel's petrol and Pratt's motor spirit; motor-cars can also be stored and repaired at their works at that address.

THE Scott Motor Cultivator, Ltd., has been registered with a capital of £50,000, to adopt an agreement with J. Scott, and to carry on the business of mechanical engineers, motor manufacturers, makers of agricultural implements, etc.

THE Lincoln Motor 'Bus and Parcels Delivery Company, Lincoln, ceased to carry on business on Saturday last. This decision was come to at an extraordinary meeting of the shareholders of the company, held at the Saracen's Head Hotel, Lincoln, last week.

THE Bucks, Herts, Berks, and Oxfordshire Traction Company, Ltd., is the title of a new company recently formed to run motor-cars for the conveyance of goods, passengers, and tourists through some of the most delightful parts of those counties.

A HAMPSTEAD doctor, writing to the local press, complains of the speed at which motor-cars pass his house, and states that he has a supply of bandages ready for accidents. This is very thoughtful, but as the medico does not give his address he is not likely to obtain much practice from motorists.

MR. G. BRAULIK, of 217 and 218, Upper Thames Street, E.C., is placing on the market new "Beez" pocket volt and ampere meters, which are particularly adaptable for use in connection with the accumulators and batteries of motor-cars. The chief novelty claimed is in the means of connection employed. One pin connector is attached to the instrument by a flexible cord, the second being loose. One end may be screwed into the meter when in use or pushed into the other connector when carrying in the pocket, thus securing a perfect connection between both points.

HERE AND THERE.

THE London works of the Locomobile Company of America will be closed to-day (Saturday) for the annual outing.

MR. S. W. FULLER, of the Dorking Cycle Works, South Street, Dorking, stores both Pratt's motor-spirit and Carless Capel's petrol, as well as oils and greases for motorists.

THE Automobile Club will hold a run to Hertford to-day (Saturday) starting at 2.30 p.m. The route followed will be *via* Child's Hill, Finchley, Barnet, and Hatfield.

OWING to the increased production arranged for some months ago, the Hozier Engineering Company, Ltd., are now able to deliver "Argyll" voiturettes in about one week from date of order.

MR. BALFOUR drove from the House of Commons on Wednesday in his motor-car to Chiswick to be present at the formal inauguration of the electric tramways running from Shepherd's-bush to Southall.

WE regret to learn of the death of Mr. George Bates, of Coventry. Mr. Bates, who was well known in the district, was a member of the firm of Payne and Bates, makers of the Godiva motor-car.

MESSRS. FRISWELL, LTD., are issuing from 48, Holborn Viaduct, an illustrated catalogue of Peugeot cars, for which they are the sole agents in England. Eight different types of cars are depicted in a clear and attractive manner.

IT is worthy of note that Rivierre, mounted on his Werner motor bicycle, went through the Paris-Berlin ride of 754 miles in 32 hours. Considering that a number of the big cars broke down *en route*, it speaks much for the little machine that it got through the run so well.

IN connection with the annual meeting of the British Association which is to be held in Cheltenham from the 29th inst. to August 2nd next, it is proposed to organise an exhibition of motor-cars suitable for medical men. Arrangements are also being made so that intending purchasers can be taken for trial runs in the grounds surrounding the Cheltenham Winter Gardens.

ONCE more the importer of a foreign-made automobile has found himself in a contest with the United States Customs authorities. The importer of the Mors vehicle, Mr. J. C. Smith, has carried the case to the Board of General Appraisers, who have sustained the consular invoice, which certified that Mr. Smith had paid for the car at second hand £200, and overruled the examiner who had fixed the valuation at £500. The full Board of General Appraisers will now review the testimony, Collector of the Port Bidwell having appealed. For two months the car has been in the possession of the appraiser.

THE Reading Automobile Club held a hill-climbing competition up Peppards Hill a few days ago. The hill to the common measures 267 yards in length, and includes gradients of one in six, one in six and a half, one in seven, and so on. After a keen competition the following were declared the winners. Class A.—Fastest car: Dr. Major's $2\frac{1}{4}$ h.p. Baby Renault. Time, 54secs. Fastest tricycle: Mr. Littleton's $2\frac{1}{4}$ h.p. De Dion. Time, 39secs. Class B.—Mr. A. J. Dew's 5 h.p. Renault car. The cup is therefore jointly held by Dr. Major and Mr. Littleton, and a certificate under Class B. has been granted to Mr. A. J. Dew.

ALL English motorists who contemplate touring in France should procure a copy of the handy pocket guide issued gratuitously by the Michelin tire people, at Clermont Ferrand (Puy-de-Dôme). In the 1901 edition, which has just been issued, about fifty pages are devoted to the Michelin tires, hints as to their repair, etc., the remaining 500 pages giving in alphabetical order all the leading towns and villages in the country, with the names of the hotels, depôts where *essence* is stored, repairing establishments, etc. The little book is invaluable, and were the firm to charge 5s. for it, instead of offering it gratuitously, it would be well worth the price.

THE Queen of Italy is one of the latest to join the ranks of Royal motorists.

MR. HARRY FURNESS utilised the motor-car in his cartoon in the *People* last week.

THE Automobile Club de Belgique will hold a hill-climbing competition on the Sauvenière Road, near Spa, on the 21st inst.

THE Locomobile Company of America have this week shipped from their London dépôt four cars to Russia and also one to Egypt.

THE Swiss Automobile Club held a race from Geneva to Soleure the other day. The winner was M. Perrot, who, on a 24 h.p. Panhard covered the 176 kilometree in 4 hours 50 minutes.

THE Chief Constable of the County of Cornwall has received instructions to keep an eye on motor-cars, the drivers of which exceed the legal speed.

AS a consequence of the anticipated suppression of road racing, it is proposed to lay out an "autodrome," near Quatre-Bras, in Belgium, where the speed of motor-cars and the skill of their drivers can be tested. The track is to be from two to three miles in length; a grand stand will be erected, and ample accommodation for repairing and storing provided.

THE streets of Sèvres, a pretty suburb of Paris, were, one day last week, so crowded with motor-cars and cycles that many innocent people inquired if another big race was about to start. Nothing of the sort was, however, under contemplation. The owners of the cars and cycles were simply waiting their turn outside the Police-court, wherein over two hundred of them were fined for furious driving and other offences, which all declared had not been committed.

THE Automobile Club of America is erecting at its own expense signposts on the roads from New York to Bridgeport, and from New York to Albany. The posts are ten feet in height, made of Bessemer steel, and painted black, with aluminium letters on the four arms, and arrows indicating the way. They are to be placed at all important crossings and branch roads. There will be twenty of these guides between Bridgeport and New York. Between Albany and New York there will be thirty, and forty will be erected in various portions of Long Island.

AN improvement has just been made in the service between London and Switzerland, *via* Dover and Ostend, which will be much appreciated by tourists. Beginning on July 1st and continuing until September 30th, a new "Train de Luxe," of greatly accelerated speed, is running daily between Ostend, Bale, and Lucerne, and *vice versa*, in correspondence with the train leaving London at 10.0 a.m. As the number of places in the new train are necessarily limited, passengers are recommended to book beforehand. First-class express tickets alone are available, and a supplementary ticket must be obtained from the Sleeping Car Company. The new train, known as the "Swiss Express," consists exclusively of sleeping-cars and saloon restaurant-cars, and runs from Ostend, without change of carriage, to Lucerne, and *vice versa*. Full particulars regarding the new service can be obtained from the Belgian State Railway and Mail Packet Offices, 53, Gracechurch Street, E.C.

THE A.C.F. has taken the sensible decision to limit in future the weight of racing motor-cars in its competitions to 1,000 kilos. It is, perhaps, a pity this has not been done sooner. It might have saved a great deal of trouble, and great losses to some firms. There is nothing sportsmanlike in building huge machines just for the purpose of getting more speed. Where the sport comes in, is, in our mind, to beat another maker on equal terms. What a splendid breed of motor-cars will be produced if Panhard, Mors, Daimler, Napier, and so forth, compete to make the quickest car of a given weight. The Panhard light car shows this up, and Giraud's performances on it in the recent races are a lesson on the subject. Several makers have begun to construct cars on these lines, and two Belgians, Deschamps and La Metallurgique, had 12 h.p. cars entered for the Paris-Berlin race. When they came to be weighed, however, they were over the allowance, and they had to race in the heavy car category.

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs.

A NEW depot has been just been opened at 15, Newman Street, Oxford Street, W., by the Thames Valley Motor-Car Company, Ltd., for the sale and exchange of motor-cars.

ACCORDING to a telegraphic despatch from New York, Mr. Albert C. Bostwick has broken the world's mile automobile record at Long Branch, his time being 1 minute 16 $\frac{3}{4}$ seconds.

At the last meeting of the Penmaenmawr Urban Council Mr. J. Bowen called attention to what he described as the "terrible speed" at which motor-cars drove through Penmaenmawr. No action was, however, taken.

DURING the stay of the racing cars in Berlin, they were put on exhibition. A large number of motor engineers used the occasion to study the different constructions, and the pupils of engineering schools visited the show under guidance of their professors, who lectured on the cars.

MR. J. CALCOTT, jun., of Coventry, met with an accident whilst riding a motor-cycle in that town one day last week. In trying to avoid a cyclist who was rounding a corner on the wrong side, Mr. Calcott ran against the kerb and was thrown, sustaining some severe bruises and cuts.

THE North Dublin Rural District Council has adopted a resolution that the County Council be requested to frame bye-laws regulating the speed of motor-cars in county Dublin. The Chairman considers that motor-cars are a great nuisance, although they are patronised by the King.

THE Thornycroft Steam Wagon Company of America, have delivered a steam wagon of 8,000 pounds capacity to the Otis Elevator Company, Yonkers, N.Y., who are testing it at their works prior to putting it in service between their factory and New York.

A FIREPROOF cement, specially intended for repairing damaged sparking plugs, has been put on the market by Mr. Stephen F. Wiles, of the Iverna Cycle Company, 30, King's Road, Reading. The cement, which has been named Iverna, should meet a long-felt want. It is put up in tubes, of which a sample has been sent us for trial.

THE chief of the Fire Brigade at Washington, U.S.A., has decided to use motor-vehicles to carry himself and his assistants to fires. A report has been made to the District Commissioners on the subject, and it looks as if the change would lead to the proposal to substitute motors for horses in every branch of the fire department in that city.

THE racing rules of the Automobile Club of America, of New York, have been published in pamphlet form. They are mainly rules of order, and are non-committal on most points of general interest. They refer apparently to speed races only, while leaving the door open for further rules in respect of other contests later if such action should be found desirable.

MR. G. P. COOKSON, of 511, Chester Road, Old Trafford, Manchester, is prepared to render prompt assistance to any motorist requiring repairs in his locality, for which purpose he has a car in constant readiness. Petrol and lubricating oils are stocked at the above address, where are also machinery and plant for repairing motor-cars promptly and efficiently.

THE Winton Motor-Carriage Company, of Cleveland, U.S.A., have issued a small illustrated pamphlet entitled "Automobling in the West," giving an account of Mr. Winton's recent attempt to cross the Continent of America on one of his machines, and showing by pictures taken on the spot the terrible condition of the mountain and desert trails which the adventurous inventor encountered.

THE issue is announced by the Board of Agriculture of two more sheets of the reduced Ordnance Survey map on a scale of 4in. to the mile. The present issues are of Hampshire and Wiltshire, and Surrey and Sussex, and, as they cover ground which is largely resorted to by motorists, and the touring season is now commencing, they have made a very opportune appearance. The maps are of admirable clearness and accuracy, as the roads are divided into three classes according to their character. The maps fold into a small compass for carrying in the pocket.

FURIOUS DRIVING CASES.

At West London, Frederick Hunter, of Cavendish Square, was summoned for driving a motor-car on the afternoon of June 15th along the Chiswick High Road at a greater speed than twelve miles an hour. Constable Alker said the indicator of the bicycle which he rode in pursuit registered a speed at one portion of the road of twenty miles an hour. The defendant, who admitted going eight miles in 38 minutes, inquired if it was evidence to put in the indicator. Mr. Lane: Yes, it has been tested and found correct. The defendant was fined £3, with 2s. costs.

At West London, Arthur Cohum, of Duke Street, was summoned for driving a motor-car on Sunday, June 16th, along the high road, Chiswick, at a greater speed than twelve miles an hour. The evidence in support of the case was given by Constable Alker, who followed in plain clothes on a cycle, and found that the speed indicator attached to his machine registered the rate at one portion of the distance at twenty-two miles an hour. Defendant disputed the rate, and said the time exceeded two hours in driving from Duke Street to Maidenhead, a distance of twenty-seven miles. The constable said it was the fastest car he ever followed, and he could scarcely articulate when he stopped. Mr. Lane, K.C., said it was clear defendant had exceeded the regulation speed. He fined him £3, with 2s. costs.

At Steyning, Robert Crawshaw was summoned for driving a motor-car at an improper speed at Southwick on June 9th. He did not appear, and Mr. Staples Firth, who represented him, handed in a medical certificate stating he was suffering from nervous collapse. P.C. T. Bristow stated that on Sunday, June 9th, he was in Albion Street, Southwick, accompanied by P.C. McNally. Shortly before half-past six in the evening he saw a motor-car coming along very fast from the direction of Shoreham. Witness timed it with a stop watch for a furlong, and found that the rate of speed was 18 $\frac{3}{4}$ miles an hour. P.C. Bristow handed a plan of the locality which he had drawn up to Mr. Firth, who said it did him very great credit, and asked to look at his stop watch. Examining it, Mr. Firth objected to it, as it was started by a slide at the side instead of by pressing the top. Mr. Firth: When you were sent there, you didn't want to come back empty-handed? Witness: It makes no difference to me. Mr. Firth contended that the witness could not tell when the motor-car passed the particular point at the commencement of the furlong, and questioned him as to whether anyone was actually incommoded or in danger, but the clerk (Mr. G. A. Flowers) and Mr. West said it was not necessary to prove under the section of the Act governing the summons that the life of any particular person was in danger. P.C. McNally, who was with P.C. Bristow, stated that there were many people about when the motor-car came along, and they scattered to the sides of the road. Questioned by defendant's solicitor, witness suggested that defendant was unwilling to stop. For the defence, Mr. Firth urged that his client, owing to the state of his health, could not have travelled at that rate, and also intimated that the police would naturally be biased. He contended that the stop watch was old-fashioned, and also that it was impossible to properly locate the point where the furlong commenced. The Bench convicted, and ordered defendant to pay £1 fine and 18s. costs.

LOVE ON A MOTOR-CAR.

At Brentford, George Hageman, a French subject and an engineer, was charged with driving a motor-car to the public danger, and, further, with doing serious bodily harm to Joseph Cobbler. Charles Weedon, of Isleworth, stated that he saw prisoner's motor-car coming along the road, not at a very quick pace, but so carelessly steered and driven that it went in zigzag fashion. The reason for this was to be found in the fact that prisoner had his arm around a young lady, who was sitting beside him, and was kissing her. (Laughter.) Accordingly he had only one arm to steer and drive with—his left. Witness saw the car dash into the back of the youth Cobbler, who had been walking slowly behind a baker's cart. Cobbler was knocked under the cart, and the young lady was pitched out on top of him. As she fell she called out to prisoner, "Oh, Georgie, go along! Don't stop!" Prisoner, through an interpreter, declared that the baker's cart, behind which he had been slowly driving, came to a sudden stop, so that he could not avoid driving into Cobbler. The reason he made off without stopping when the accident occurred was that he meant to try and find a policeman! Mr. J. Allen Brown commented upon the absence of the young lady, who should have been an important witness, and fined prisoner £2 and costs, plus £2 compensation to the injured youth—£5 17s. 6d. in all.

AUTO-MOTOR EXPRESS COMPANY, Ltd., v. HOLLICK.

At Ramsgate County Court, Mr. Frederick J. Clements stated that he was chairman of the Auto-Motor Express Company, Limited, which was registered on August 20th, 1896. Defendant was a member of the Board of Directors, and possessed twenty £1 shares. On March 1st, 1901, a final call of 10s. being made, defendant resigned his directorship. £17 10s. was due from him in respect to this and previous calls. Defendant's contention was that when the company was formed and he applied for shares

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

it was on the distinct understanding that it was not to be a manufacturing company. The company was formed to purchase cars to carry goods and passengers, and Mr. Clements and he (defendant) were appointed a committee to inspect the various kinds of cars with a view to finding the ones most suitable for the purpose. They were about three years looking for suitable cars, and up till the time he resigned from the directorate none had been found. Afterwards, apparently, plaintiff went to work with Mr. Softley to produce a motor-car, but this he (defendant) alleged was distinctly against the terms of the prospectus. To indulge in the manufacture of cars or motor machinery was, he submitted, not a legitimate object of the company. His Honour was of opinion that the memorandum of the company gave them power to manufacture, and gave judgment for plaintiff.

NO LIGHTS.

At Richmond (Surrey), Arthur Withers, of Kensington, was summoned for driving a motor-car on the evening of June 22nd and failing to have attached thereto a red light behind. P.C. Sexton proved the case. The defendant said he was not aware a red light behind was required. A fine of 5s. and costs was imposed.

At Richmond, Oliver L. Atkins, of Streatham Hill, who, through his solicitor, admitted that he had not the necessary red light on the back of his motor-car, was fined £2 and costs, the explanation being that defendant was detained three hours owing to the machinery going wrong.

At Coventry, Herbert Duret, of Coundon, was summoned for riding a motor-cycle at Coundon on June 29th after dark without having a lighted lamp attached. He did not appear, but sent a letter, in which he stated that he had ridden without a light for a short distance, and would have been home earlier, but had been delayed and had to walk several miles by reason of a badly burst tire. A fine of 2s. 6d. and costs was imposed—12s. in all.

"THE POLICE ONCE MORE ON THE FRONT."

The following, as well as above title, are from the pen of a modest and anonymous contributor, and have not been edited:—

"I am very sorry to say that an Motor Driver was somment for driving 14 miles on houre he drove an Car which was speedet to 14, and the Police how aparet with 5 witnesses gained the day, there was Bobby how said the Car was driving 20 miles an houre and he also round on very sharp corner, then No. I. an coachman how said the man drove to farset to be able to tell the speed, but he made sure of 20 miles the houre, he also said that his horse tooke no notice, of the Motor but if I had not kept my horse on the right side of the road, the Motor my have roun in to me, now No II. that was the blacksmi how was not able to get out of his shop to see the Motor passing, but was sure that the Car was driving over 20 on houre, of course the horses were shoet befor starting out and the driver had there for no buissnes to stop outside the Shop. No III is on Boot-maker, which was standing on his Shop window waiting for some work to come in to get on day's leaving, but got his money with out work but for 2 he said he was able to write on Bicile 18 miles on houre but not able to keep up with this motor (14 on houre) As it hapent No IV. Save the Motor broking down and on little while after it passt him again, there are the Daimer Motor gaining the Race, not like the Daly Mail said on the 29 June as they were afraid to go in for on Race, Daimler is as good as many more good old English thing's, however, this poorer horse braker did not like to see the Motor pwover Driver loost the day after on 1 hounr I, by seit having on much exelent Lower he was found for 40 S. and 32/6 for this 5 workman which Bobby engaget."

OBSTRUCTION.

At Bow Street Police Court, D. M. Weigel, motor-car agent, of 97, Long Acre, was charged with having caused an obstruction by means of a motor-car. Mr. Albert Osborn appeared for the defendant. Chief Inspector French stated that at 2.25 on the afternoon of the 21st ult. he was in Long Acre, and saw smoke issuing from the defendant's premises. There was a motor-car outside, and it was causing an obstruction. As the witness was in plain clothes at the time, he instructed Police-constable 199 E to direct the responsible person to remove it. The constable spoke to the defendant, who at once came to the witness and said, "That car is mine. I have had it there twenty minutes, and it shall stay there as long as I like." The car remained outside from 2.25 until three o'clock. Two constables gave evidence in support of the chief inspector's story. The defendant was called, and stated that on the afternoon of the day in question a probable customer, who was not now present, called upon him to inspect a motor-car. The witness took him for a ride, and did not return to Long Acre until ten minutes to three o'clock. The motor was the smallest car known, 6 ft. long by 4 ft. 6 in. wide. The obstruction was caused by the crowd—not by the motor. He did not tell the chief inspector that he had been there twenty minutes, and intended to remain there as long as he liked. He had only returned about five minutes when the inspector spoke to him. Frederick Strudwick, a man employed at

the defendant's premises, said he was sure that the car was not brought back until a quarter to three o'clock. Other witnesses gave evidence to much the same effect. Mr. Marsham said he must believe the evidence of the police officers, who used their watches, and ordered the defendant to pay 5s. fine, and 2s. costs.

THE CHISWICK FATALITY.

At the West London Police-court, Charles John Scarisbrick, manager of the Crouch-end Opera House, surrendered to his bail before Mr. Lane, K.C., to answer the charge of causing the death of Elizabeth Pearce, while driving a motor-car in Goldhawk Road, on the evening of June 26. Mr. Paul Methuen, barrister, appeared for the accused. At the inquest on the body of the unfortunate woman the jury returned a verdict of accidental death and Mr. Lane, K.C., stopped the hearing of the defence, and acquitted the accused of furious driving. He said there had been a mistake, but it was not one of negligence or carelessness. He ordered the accused to be discharged, holding that the verdict of the coroner's jury was correct.

A NON-STOPPING CASE.

At Kingsclere, H. T. Francis was charged with not stopping his motor-car on being signalled by the Rev. A. T. Finch, vicar of Kingsclere, to do so. Defendant pleaded not guilty. Mr. C. Lucas appeared for the defence. The Rev. A. T. Finch stated that he was driving just above Park House on Saturday afternoon, the 22nd ult., and when going up Cottoynton's Hill he saw a motor-car approaching. He immediately alighted from his dog-cart and tried to pacify his horse, which became very restive and excited and tried to get up the hill. He clung hold of the animal and pulled him off the road, but he dragged witness on to the grass. After a time he pacified it and led it down the hill, and went straight to the inspector. Witness signalled twice in the usual way for the occupants to stop, but they took no heed and went straight on. Mr. Lucas, for the defence, said the first thing the occupants of the motor-car saw was someone standing at the horse's head. They never saw any hand held up, and they thought the owner had drawn out of the way for them to pass. Nothing was said, and no assistance was asked for. It was a misunderstanding, and the driver had authority always to observe the rules of the road. H. T. Francis, the engineer, said he had seven years' experience. The first time he saw Mr. Finch he was holding his horse's head. He saw no signal, and was going at the slowest speed possible, viz., four miles an hour. The Chairman said the Bench considered the case proved, as the Act required a person to stop on the hand being held up, and the defendant was ordered to pay £3, including costs.

AN automobile club has just been formed at Toronto, Canada.

THE *Koelnische Zeitung*, in a leading article on the advantages of the employment of automobiles in military service, states that tests to be made at the forthcoming German manoeuvres will complete the experiments which were commenced two years ago, and which have hitherto given the best results. For this year's experiments the Reichstag has voted nearly £9,000. Special attention will be paid to the methods for transporting the necessary provision of petrol, with the least danger of explosion, and the consideration of the possibility of making the motor-cars keep up with the troops in districts where there are no good roads.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, JULY 20, 1901.

[No. 124.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ON Saturday last the members of the Lincolnshire Automobile Club had a most enjoyable run to Wiseton Hall, the residence of Captain J. F. Laycock, J.P., Vice-President of the Club. The cars went *via* Gainsborough, a reduction of 5d. per car having been secured by the Secretary for the day on the tolls at the Trent bridge. The weather was perfect, and, with the exception of one or two minor accidents, all arrived safely. The roads proved very good, and the long rise from Beckingham to Gringley was taken well by all. The district around Wiseton is very picturesque, and the view from Gringley Hill, which includes an area of forty miles in any direction and Lincoln Cathedral, was greatly admired. Captain Laycock and his sister, Miss Mitchelins, received the members and conducted them over the beautiful orchid houses, the rosary and garden, and the stables and motor-stables. The visitors were somewhat disappointed at not being able to see the famous Mors car and its more famous driver, M. Fournier, but probably another opportunity will be offered. Tea was provided in the cricket pavilion, the day's run being greatly enjoyed by everyone.

Club Run to Hertford.

THE short notice was probably the cause of the poor attendance at the Automobile Club run to Hertford on Saturday last. Those who took part in the journey had a very pleasant time. Mr. R. E. Phillips was present on his new 12 h.p. car; Mr. Johnson and Mr. Bruce on their Darracq; Mr. and Mrs. Cordingley and Miss Pursehouse on the M.M.C. Panhard; Captain Langrish on his 8 h.p. Soncin tricycle; Captain Lloyd on a bicycle; Mr. Winton on a 3 h.p. tricycle, and Mr. Sampson on his 6 h.p. Benz. After dinner many returned to town, but several stayed the night and had a very pleasant cross-country run the next day.

Aberdeen to London.

THE Hon. L. Canning, J.P., D.L., has just accomplished a highly satisfactory run from Aberdeen to London, in company with Mr. Ean Cecil on his cars. The latter was obliged to change cars on the way, like relays of horses, no less than three times in order to keep up with Mr. Canning's Century. Mr. Cecil had an accident with one car, and bad luck with his selection of others, which were very unsatisfactory. Progress was slow till Northallerton was reached, where Mr. Cecil was fortunate enough to find a new Panhard voiturette, which he bought from Mr. Ernest Hutton. This little car is a beauty, and very fast, but the Century was able to just beat it, and remain "cock of the walk" to the end. The run was over the Grampians, past the famous Devil's Elbow, where Mr. Cecil lost one car, which was capsized; then through Edinburgh, Hawick, over the Cheviots to Newcastle, Durham, Darlington, Northallerton and York to London.

County Councillors and Motor-Cars.

AT the last meeting of the West Riding County Council the Chairman alluded to the question of roads in relation to motor-cars and traction engines which he had introduced at the meeting of the County Councils' Association on May 15th, and stated that he had come to the conclusion that some sort of means of identification of the machines would be ultimately required. The reckless drivers were the exception, but he thought it would be advisable as far as possible to preserve the interests of the public. Mr. F. Bacon Frank was of opinion that the maximum penalty of £10 for offending drivers needed enlargement. If the penalty was raised to £50 some good might be done.

Petroleum Licences.

IN April last Messrs. D. Napier and Sons were summoned by the London County Council, under the Petroleum Act of 1871, for storing petroleum spirit without a licence. Counsel for the London County Council contended that the regulations issued by the Secretary of State in pursuance of the Light Locomotives Act of 1896 did not apply to trade premises, but applied only to private individuals who possessed motor-cars. The summons was dismissed, with £10 10s. costs. The London County Council are appealing against this decision. The Emergency Committee of the Motor Union under the auspices of the A.C.G.B.I. have decided to contest the appeal, for the following reason. They have every confidence that, if the London County Council were to win the appeal, they would place no unnecessary restrictions on the storage of petroleum spirit; but the effect of winning the appeal would be to give power to the local authorities throughout the country to refuse licences and otherwise to hamper the multiplication of motor-spirit merchants which is so eminently desirable and necessary to the growth of automobilism. If the appeal is successful, then manufacturers or persons who wish to sell motor-spirit will be required to obtain a licence from the local authorities, to submit drawings of their proposed storehouses, etc., etc., and their applications may be refused. If the appeal be defeated, the storage of petroleum spirit will continue to be regulated by the revised regulations of the Secretary of State of May 15th, 1900.

The Dangers of Horses and Motor-Cars.

VERY sensible is the attitude of the *Spectator* when explaining that "there is often far greater danger from the vehicle drawn by horses than from the horseless vehicle. And for a very simple reason. It is far easier to stop a motor-car at a moment's notice than a horse." This is a fact which automobilists have long tried to emphasise upon the public, and it is gratifying to see the general press taking up the idea. "What is wanted," continues our contemporary, "is to produce a strong sense of responsibility in the drivers, and not to tie them up with paper regulations." That is the whole gist of the matter. With drivers recognising their responsibility, and a public that realises the danger that lurks in rushing across roadways heedless of what is coming along, there would be few accidents due to motor-cars.

The Surrey Police Again.

THERE seems to be a very exciting contest going on in Surrey between automobilists and the police, and, so far as we can learn, the latter are acting in a very objectionable manner. According to trustworthy informants, plain clothes officers are being stationed at various points on the Ripley road to look out for unwary motorists, and they are apparently anxious to take victims before the magistrates. Such energy is not wholly pleasing, and we could wish the police were better employed. One thing is certain—motorists will have to be very careful when travelling along Surrey roads.

A New Scotch-Built Petrol Car.

THURSDAY last week saw the trial of the first motor-car, produced by the Kingsburgh Motor Construction Company, Limited, of Granton, N.B. The opportunity was taken advantage of by the Eastern section of the Scottish Automobile Club to have a run to Cramond Brig, six cars turning up at the rendezvous. The afternoon was extremely pleasant, and the run was a thoroughly enjoyable one, though the dust was a little troublesome to those following the leading vehicle. The "Kingsburgh" car, which is intended for public service, was the subject of favourable comment throughout the journey. It is seated for fourteen, is fitted with 12 h.p. two-cylinder engines, and has three speeds, five, eight, and twelve miles an hour. The total weight of the car is 27½ cwt.

Automobilism in Guadeloupe.

THE automobile has penetrated into Guadeloupe, in the West Indies, M. Hubert Ancelin having recently imported a 10 h.p. Delahaye. One of his first runs was from Pointe à Pitre to Basse-Terre, a distance of seventy kilomètres, which was accomplished in a little over two hours. As might

ON A COUNTRY ROAD IN GUADELOUPE.
Clic' de [La France Automobile.]

be expected, the advent of the horseless vehicle caused much excitement among the natives. We hear that M. Ancelin contemplates starting a service of motor-cars in Guadeloupe, and that his scheme is receiving the support of the local authorities.

Racing Cars in England.

AT the meeting of the Executive Committee of the Motor Union recently held, the following resolution was unanimously passed:—In view of the very high speeds which may be attained by modern racing cars, the Executive Committee of the Motor Union view with concern the possibility of such vehicles

being used for the present in this country. Such cars must always present to their drivers a temptation to employ speeds the use of which, in this country, might be regarded as open defiance of the law. High speeds are likely to bring about injurious restrictive legislation, and are a menace to the progress of the movement and industry in this Kingdom. Further, the possibility of the removal, which may be hoped for if only moderate speeds are employed on the road, of a legal limit of speed, and of motor-vehicles being placed under the condition which controls other road traffic, viz., that vehicles shall not be driven to the common danger, will be endangered, if not sacrificed, by the driving of cars at high speeds in this Kingdom. The Committee of the Motor Union have, therefore, decided not to defend members in cases in which they may have been driving vehicles at excessive speed, and they recommend the Club Committee of the Automobile Club of Great Britain and Ireland, and the Committees of its affiliated Clubs, to refuse to allow such racing cars to take part in competitions on the road, trials on the road, or Club tours held under the auspices of the respective Clubs.

The Earl of Carnarvon and His Motor-Cars.

AS recorded in another column, the Earl of Carnarvon was summoned in respect of two of his motor-cars, one driven by himself and the other by his *mecanicien*. The case was heard at the Petty Sessional Division of Epping, on Friday, 12th inst. Evidence was given by a police officer, who swore that he saw a motor-car coming at a terrific speed dashing down a hill outside Epping and up another one, at the top of which he was stationed, and that there was a large number of holiday people about. He described the speed as being at least twenty-five miles an hour. Moreover, he stated that although he put up his hand as a signal to his Lordship to stop and shouted to him, his Lordship continued on his journey. The policeman also stated that the two cars were not very far from each other, and although he had endeavoured to stop both of them, they refused to pull up. Several witnesses were called to corroborate this, amongst others a loquacious gentleman, who described the speed of the cars as terrific and at least thirty miles an hour. He then stated he felt it his duty as one of the public to endeavour to put a stop to the manner in which automobilists were using the roads in and about the vicinity and driving at a grossly reckless pace. Mr. Staplee Firth conducted the case on behalf of Lord Carnarvon, and very quickly disposed of this self-appointed administrator for the public weal, and, after the magistrates had heard the evidence and the arguments raised by Mr. Firth, the Bench, after considerable deliberation, unanimously dismissed both charges.

Burglars Chased by a Motor-Car.

MR. WM. GLASS, of Sydenham, had a novel experience recently whilst taking a Motor Manufacturing Company's car from London to Coventry. Whilst renewing the water on the North Road at Willoughby he was approached by the Chief Constable and a police inspector on bicycles, who informed him that three young men had broken into a house near Daventry early that morning. They asked the motorist to carry them in pursuit, as the burglars had four hours' start. He agreed to do so, but there was a difficulty in getting the two men with bicycles on board. Next they asked him if he would carry information to the police constable at Dunchurch, so that he might look out for the burglars. On arriving at Dunchurch the police authorities there asked him to convey the information to the police constable at the next village. He resumed the journey to Coventry, keeping his eyes open for the burglars, and, spotting three men answering the description, hurried on to give information. Arrived at the address given, he found the police constable in bed. By the time he was up and had reached his gate the men were just entering the village. The aid of another man was obtained, and as the three burglars stopped to look at the car they were "collared" and marched off to an outhouse in the police constable's garden.

What eventually happened we know not, but had it not been for the motorist and his speedy car they would perhaps have never been captured.

James and Browne's New Car.

MESSRS. JAMES AND BROWNE, of 78A, Queen Street, Hammersmith, are about to bring out a new car of which great things are expected. We are not at liberty at the moment to publish an illustration of the vehicle or to describe it at length, but we may mention that the engine has both induction and exhaust valves mechanically operated. Both valves and valve sleeves are interchangeable, so that a spare part for one is a spare part for all. The valve springs are all set outside, and so removed from heat influence. The engine, which is nearly completed, has two cylinders, and will be set horizontally. It is of eight normal horse-power, the cylinders being 4in. bore and 6in. stroke. All the bearings of the gearshafts are formed with oil baths, and fitted with ring lubrication, so that oiling with a car in constant work will be necessary only about once a week, or even less frequently. The gear, which is all parallel, will afford four forward speeds and one reverse, all controlled by one lever. The steering axle is straight, and the springs are set on the French *glissade* principle. A small car on the same system has already been run with most satisfactory results.

Motor-Bicycles.

DURING the past week one of ours, who has been somewhat sceptical as to the future of the motor-bicycle, has been riding an "Excelsior," manufactured by Bayliss, Thomas and Co., Ltd., Coventry, and has come to the conclusion that there is a great amount of pleasure and fascination to be derived from motor-bicycling. At first sight it seemed a difficult matter to steer and manage a cycle weighing something like 75lbs. with a motor "coughing" at one's feet, but in actual practice, after the first forty yards had been traversed, all fear had vanished, and it was, if anything, easier to steer, as the additional weight gave greater steadiness and stability. Regarding the motor, as every part is so accessible and, with a few lessons in mechanics, easily understood, this trouble would soon be got over by an ordinary cyclist. Then again, by removing the band—which is only the work of a moment—the machine can be ridden home as an ordinary cycle should the motor go wrong. Our representative says that his week's experience has fully convinced him that there will be a great future for motor-bicycles, and that it is only a question of an opportunity to try these instruments of speed for hundreds of cyclists to invest in this new form of locomotion. The vibration is very little, and on a good road a speed of eighteen miles an hour can be comfortably maintained; of course, for those who desire a fair amount of exercise, there is plenty of scope, as, with only a 1½ h.p. motor, the machine can be assisted up ordinary hills. An experienced motor-bicyclist has stated that he can now steer his way through crowded thoroughfares with as much safety and confidence as on an ordinary bicycle. It is merely a matter of practice and experience.

A Hint to Lowestoft.

SURELY some of the proverbial wisdom of the East must have forsaken the promoters of the Lowestoft Corporation Bill now before the House of Commons with the object of empowering the Corporation to raise £185,000 for tramways. Lowestoft has a population of 29,000, largely seafaring, and the proposed loan would increase the rates to something like 11s. in the pound. The Corporation would do well to investigate the tramway problem as presented by many a borough that numbers its inhabitants by six figures, mostly operatives, yet cannot make the service pay. Now if Lowestoft really requires transport, and we may venture on a word of advice, we would suggest a motor-car service, municipal or otherwise. Such a service is infinitely less costly to establish, requiring no permanent way,

and is just as economical in up-keep; more so, in fact, if horse traction is contemplated. One-fifth of the proposed expenditure should, in our opinion, provide Lowestoft with such transport as it requires.

A Notorious Policeman.

THE policeman who was the cause of Sir Edgar Vincent's recent appearance in the police court seems to be achieving distinction as a "motor catcher." Mr. F. Leigh Martineau, of Eyot Gardens, Hammersmith, was a victim of his ingenuity last summer. It will interest other motorists to know that this particular upholder of the law weighs about twelve stone, and rides a bicycle geared to 81 with no brake. He is apparently on duty to catch motorists, and now that his testimony is regarded with such acceptance it would be well for drivers to be careful when passing along his "beat."

A MOTOR CAR IN GUADELOUPE—INTERESTED NATIVES.

Motor-Cars in the Manœuvres.

SIR EVELYN WOOD has written to the Automobile Club stating that the Secretary of State for War has had under consideration the subject of proposed manœuvres by members of the Automobile Club with a view to testing the use of automobile vehicles for military purposes, and that he is prepared to agree tentatively for this year to the following plan:—(1) The duties to be confined to keeping up lines of communication, carrying officers and despatches, and work of a similar character. (2) Owners of cars to make their own arrangements for supply of petrol and other necessities for running the cars, the military authorities to afford facilities for safe storage and defray cost of transport by rail. The cost of fuel also to be refunded at termination of manœuvres. (3) Personal expenses for owners to be allowed on basis of military regulations—viz., a nightly allowance of 20s. up to seven nights, including night of arrival at a station, and 15s. after seven nights. Mechanic, 5s. for first seven nights, 3s. afterwards. Allowance for messing, in lieu of all of the rates proposed above, will be given, but it is probable that gentlemen taking part in such manœuvres would be made honorary members of one of the military messes at the station. The period of manœuvres for this year will probably be from August 3rd to 10th. As for 1901 the nature of the operations will be experimental, it is believed that not more than four cars will be required, each capable of carrying from three to four persons including the driver. Members of the Club who have cars which will hold three and the driver, and who are willing to drive

them as automobile volunteers from August 3rd to 10th, are asked to communicate immediately with the Club secretary.

American Motor-phobia.

SOME Americans suffer from motor-phobia even more severely than their English cousins. Morristown, N.I., whence the following lament, seems to be the centre of the afflicted area:—
 "Is the increasing use of country roads by automobilists going to become a serious matter, or will that usually docile animal and old-time friend of man and family become reconciled to its modern substitute and grow willingly to a quiet sharing of the highway and byway? Some declare there is no hope for it, and that the average horse grows more fearsome every time it meets the strange, queer-sounding vehicle gliding towards it. It is asserted that many country people are afraid to come to town because of the fear of meeting them, women being the most affected, of course. Horses bought for pleasure driving are said to be standing idle in the stables."

French Customs Duties on English Motor-Cars.

ON March 11th last a letter was sent by the Automobile Club to the Foreign Office pointing out that an arrangement had been come to between the Automobile Club de France and the Belgian Government, whereby members of the A.C.F. could introduce their motor-vehicles into Belgium without paying at the Belgian Customs House the ordinary customs due, and expressing the desire that some such system might be established between this country and France for members of the Automobile Club of Great Britain and Ireland, who may be visiting France with their motor-vehicles. A reply has been received from the Foreign Office to the effect that a despatch has been received from His Majesty's Ambassador in Paris, reporting that he is informed by the French Minister for Foreign Affairs that the Director-General of Customs had been requested to make arrangements on the subject direct with the Automobile Club de France. M. Delcassé has promised to communicate with Sir E. Monson as soon as a decision is arrived at.

"A Rival in the Field."

THE Automobile Club is no longer the only "recognised authority to hold trials of motor-vehicles and to give certificates in connection therewith." The Southampton Borough Police have gone into the business and are cutting the price. A quarter mile track has been opened in the Avenue, Southampton, where a P.C. takes your time at starting, and another takes it at the finish. So far as we know only three certificates have been granted, one to a lady who covered the quarter in thirty seconds. No entrance fees are charged, but a small contribution to the local rates is expected. All desiring certificates should enter at once as it is highly probable that the cost, 4s., will be increased with pressure of business.

A Wayside Story.

A WELL-KNOWN innkeeper, whose hostelry is on the confines of Wycombe, has a little tale to tell about a motor-car. It arrived at his place one evening the other week, and was safely housed by a gentleman, who intended resuming his journey along the Oxford road on the following day. Early the next morning a youthful member of the household conceived the idea of taking a motor-car trip "on his own," and as soon as it was daybreak he got the car out of its place of shelter and was soon careering with it along the road at a fast rate. In his endeavour to slacken speed the boy pulled the wrong lever, and the result was that the vehicle was brought to a sudden standstill in consequence of an unintended attempt to clear the hedge. The boy was, of course, turned out, but was not hurt. Meanwhile, mine host had been aroused by the noise in the yard, and finding the motor-car had disappeared he promptly sent for the police. The search which ensued led to the finding of the car and the boy on the roadside. What happened to the boy need not be told here.

A RIDE ON THE PRINCE'S MOTOR-CAR.

THERE were three of us, the Prince, the Descriptive Vocalist, and the Author. We set off from the Gaiety Theatre, Nottingham, at 11.30 one fine Spring morning and journeyed to Derby, via Midland Railway. Our object was to bring back the Prince's motor-car, which he had left at the Rising Sun Hotel, Friar Gate, the previous day. I might here mention that mine host of the above hotel is an exceedingly obliging man, having turned his own trap out of its coach-house in order to accommodate the Prince's car, for stabling which he made the modest charge of 1s. We were not stopping in the house either. Motorists need not be afraid of their dirty appearance giving offence at the Rising Sun, as the hotel is the headquarters of the Chimney Sweeps' Association, and probably they are used to untidy visitors.

Having cleaned and lubricated the car and laid in a supply of petrol, we found it was time for lunch, after discussing which meal we started about half-past two for our adventurous journey to Nottingham, sixteen miles away. The Descriptive Vocalist was anxious to know if we should be in time for the evening show, which commenced at seven: "I follow the performing fleas," he said, "and it takes me half-an-hour to make up." The Prince, proud of his new purchase and with the confidence arising from an extensive motoring career of nine days, assured him he would have ample time, not only to perform the transmogrifying operation known as "making up," but also to view the interesting entertainment provided by the educated insects whose turn preceded his. Through the traffic of Derby we sped, followed by the curses of cabmen whose varnish we had scraped—the Prince always cuts it fine to show what a good steersman he is and to give you confidence in his driving. Through Spondon and Risley we ran at a "steady twenty" (a week). The motor seemed to be working half-heartedly, and, although none of us were exactly "experts," we guessed that only one cylinder was firing. Soon after this the car stopped; we all got down, and after sundry turns of the starting handle and tugs at the fly-wheel, "off she went again."

Running down the hill into Sandiacre we passed a horse and cart which (the horse) took offence at our appearance, and tried to back into us; with wonderful presence of mind the Prince swerved up on to the path, scraped the wall, and came back again on to the road, just missing a lamp post, which had been carelessly left standing by the curb. After this we had rather more faith in the Prince's driving. Beyond Sandiacre the car stopped again. Evidently our batteries were running out; more twirling of the flywheel, and then a steady run until within about three miles of Nottingham, where, on a considerable incline, she halted definitely—batteries run out! The Prince rummaged in the interior of the motor! The Descriptive Vocalist swore!! The Author smoked!!! It was nearly six o'clock when we made up our minds to push the inanimate 14 cwt. to the top of the hill, and let it run down on the other side to a public-house which we knew was situated at the bottom. Oh, how we pushed! We progressed three hundred yards in half an hour; when a kindly driver of a cart was persuaded to tow us to the top. Once over the summit, we ran down grandly, running as silently as an electric car. The impetus just took us into the yard of the public-house, where we left the car, and chartered a ginger-beer cart to take us up the hill, through Lenton, into town.

Suffice to say that, dusty, oil-begrimed, and weary, we reached the theatre just in time to snatch a mouthful of food before "going on." The Descriptive Vocalist was rather less descriptive than usual that night; and Sloper, the ventriloquist's leading figure, was heard to make some cutting remarks about "moty-cars," which, although not intelligible to the front of the house, were much appreciated by those "in the know."

"The Prince of Wales" did you say? Oh, dear no, the car was owned and driven by Prince Bendon, the well-known ventriloquist and latest professional convert to automobilism.

S. BARTLEET.

THE PARIS-BERLIN RACE.

MR. C. JARROTT'S EXPERIENCES.

MR. C. JARROTT has sent an account of his experiences in the Paris-Berlin race to *Automobile Club Notes*, from which we take the following:—I got my car four days before the race, and tried it about 200 miles before the actual start. It is a 40 h.p. Panhard, belonging to Mr. Harvey du Cros. I had a fair idea of what a motor-car would stand upon ordinary bad roads, but I had no conception that it would be able to stand such a terrific ordeal, terrible roads and difficult corners, as the route from Paris to Berlin. The innumerable occasions upon which one either struck level crossings, *caniveaux*, etc., when the car practically left the ground and came down with a terrific crash, gave one the impression on every occasion that it would be impossible for the car to last very long under such rough treatment.

I started No. 13, and at the commencement of the race had some little trouble through my governors hanging up owing to the car being new, and also to the breaking of the spring pulling back the commutator. At first I thought the latter trouble was through the wire breaking, and as this wire was carried through a small copper tube, I did not see how I could repair it, as I could not get at it. I subsequently found it was the spring which had gone, and soon remedied this. These delays cost me altogether about half an hour. Between Epernay and Reims I began to

vented one seeing more than fifty yards. This mist, together with the dust made by the competitors in front, made passing impossible, and I could not catch anyone before getting to Cologne.

At Cologne my misfortunes, on the second day, began. I punctured, put in a new tube, which, after endeavouring to pump up, I found was nipped. I took this tube out, put another one in, but again, after an attempt to pump it up, took it out, and on testing it I found it was not screwed down tight at the valve seating. After this we made another attempt, and I found then that my pump had broken at the gauge. Altogether the delay in Cologne took me over an hour and a half, and a large number of cars had passed me before I got going again. Later on in the day I had further tire troubles, and it was only in the last hundred miles that I managed to regain in a small measure the position I had lost. I eventually arrived in Hanover 25th. On the third day we started out with some sort of arrangement whereby the times occupied in the two days were taken into consideration, and we were supposed to have been started in the actual order in which we had arrived over the complete course on time calculation. I eventually got away at 6.46. The road was of a most tortuous description, and I am surprised there were not a number of accidents in the first portion of the journey. I steadily overhauled the leaders, and at Magdeburg got into the first ten.

THE RACING CARS IN BERLIN. FOURNIER ON HIS MORS IS SEEN AT THE LEFT.

Cliché de]

[Allgemeine Automobil-Zeitung.

make up a little of the way I had previously lost owing to my stoppages.

Previous to this, at Viels-Maisons, after descending a very steep hill, and coming to a very sharp corner, owing to my *mecanicien* not hanging on tightly, he was thrown out, but no damage was done, and we proceeded on our way after a very slight delay. I probably took the corner somewhat faster than I should have done, owing to the fact that I was being pressed at the moment by Mr. Edge on the 50 h.p. Napier, who was close up behind.

The road through Belgium and that part of Germany leading to Aix-la-Chapelle was of the most "cornery" description, and there were innumerable danger flags put up for the benefit of the competitors. The very handsome manner in which we were looked after at every control in regard to champagne, food, cigars, cigarettes, etc., was not the least pleasant feature of the race. A magnificent reception awaited us at Aix-la-Chapelle, thousands of people coming out beyond the control to see the cars finish, and it was certainly strange to have to drive at top speed into what seemed to be a packed mass of people occupying the road, and which only parted and allowed enough room for the car to pass just as one seemed to be on top of them. I arrived thirteenth at Aix-la-Chapelle and consequently the next day started out from there for Hanover 26 minutes after Fournier. It was bitterly cold, and a mist hung over the road which pre-

Five miles this side of Magdeburg I burst the right-hand front cover, and drove into Magdeburg on the rim, where I obtained new cover and tube, and fitted same without losing much time. Soon after this I had another puncture to my left-hand back tire, which took some little time to put right, and during this operation I was again passed by three or four cars. Two of these I managed to pass before reaching Berlin. I eventually managed to arrive tenth on the course, doing seventh fastest time for the day, and gaining eighth position in the whole race.

Tire troubles seem to have been universal, but I think I had rather more than my fair share, and, of course, had some of the time I lost—even a small portion of it—been saved, I should probably have occupied a still better position. I may say that I finished each day absolutely fresh, and although the physical and mental strain was at times somewhat severe, nevertheless I did not remark it particularly. The most exciting part of the racing was passing the cars in front, when one had to drive at least half a mile in the dust, through which absolutely nothing could be seen, and which was filled with stones and sticks flung up by the car in front, cutting the face, and imperilling one's driving glasses.

The reception of the competitors in Berlin by the German Automobile Club was worthy in every respect of the race. Fêtes, banquets, etc., were arranged on every conceivable occasion for the benefit of the visitors, and I personally look back upon the

race as one of the most pleasant experiences I have ever had. I calculated to have done one stretch of 33 kilometres in 21 minutes. On the last day I did 6 seconds slower than Fournier over the course, and finished 1 hour and 20 minutes after him.

CORRESPONDENCE.

THE WATER GAUGE IN STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have noticed that among users of steam cars of the Locomobile type very few pay attention to whether the column of water in the water glass moves up and down when the car is in motion. One often hears of boilers being burned when the water glass showed water, but in such cases undoubtedly the column of water in the glass was "dead," and was being held up by some obstruction, or a check valve which was seated. It is highly important that notice should be taken of the mobility of the column in the glass, and not alone of the presence of water, as only under those circumstances does the water glass reveal the true level of water in the boiler.—Yours truly,

J. REYNOLDS.

PREVENTION OF SIDE-SLIP, FORE-DRIVING, ETC.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to the comments to which my article, "A Run Across France on a Racer," has given rise and the "blue haze" in which the whole subject seems involved, I have been waiting to see if anything more terrible than the "maze of driving chains, swivels, universal joints, levers, and bad language" was likely to be the outcome. This, I am pleased to find, has not been the case, but instead practical work in the direction I have foreshadowed is shown to be in progress, as evidenced by the letter from your correspondent Mr. George Freestone.

I am delighted to hear from Mr. Sidney Russell that the mode of construction I referred to would secure the advantages I claimed for it. Would it be troubling him too much to give me the names and addresses of manufacturers of the "blue haze," which it appears will have to be fixed beneath the cars built upon this principle. Doubtless it is due to my impracticable temperament that I fail to grasp the advantage of also fixing the "lever" underneath the carriage, because it seems to me it would be so very inconvenient to have to crawl in under one's carriage every time one wanted to start, stop, or change the gear.

With regard to the bad language, I always manage to pick up the requisite quantity on the road whilst in company with other drivers of petroleum carriages, even those which are not "all-wheel-steered and fore-carriage propelled." In reply to your correspondent's remark re cost, I am willing to pay a good price for the "blue haze" but not for the other complications which in my opinion are quite unnecessary adjuncts.—Yours faithfully,

A. R. SENNETT.

FROM LONDON TO BARNSTAPLE ON A WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I feel sure there are many people who still doubt whether motor-bicycles are practical machines or only unsatisfactory toys. Possibly the following facts may help them to decide. On Thursday, July 11th last, I left London at a very early hour, 5.15 a.m., so as to avoid the traffic. I was on my Werner bicycle, *en route* for a place five miles from Barnstaple in North Devon. The distance is 210 miles, and I arrived at 6.45 p.m., having stopped 2½ hours on the way for luncheon and rest. I went *via* Reading, Marlboro', Trowbridge, Frome, Bridgwater, Glastonbury, Taunton, Wiveliscombe, and Barnstaple. Thus the 210 miles were covered in eleven hours, an average of just over nineteen miles an hour. Considering that about fifty villages and towns were traversed at a speed of eight or nine miles an hour, I think the average was good, for it was never any question of racing with me, and I only used the full power of

the motor to climb the hills, some of them, notably in Frome itself, and in the neighbourhood of Wiveliscombe, being terribly stiff. However, the sturdy little machine carried me triumphantly up all of them, and I never had occasion to walk once during the day. I could have easily kept up an average of twenty-five miles an hour had I chosen to do so.

Finally, there was absolutely no breakdown; the machine needed oil only about every hour or so, the trembler was adjusted twice, and a gallon of petrol was purchased at Shepton Mallet. Eleven pints of petrol carried me the whole distance, at a cost of 1s. 10d., with petrol at 1s. 4d. per gallon. The above figures amply demonstrate the fact that this, the most economical and lightest of automobiles, is indeed a very wonderful and practical machine. I have now had two years' constant experience with this type of motor-bicycle, and have as constantly declared my very favourable opinions concerning it—too enthusiastically, some people may have thought—but I can now point to the marvellous rides of Bucquet and Rivière in the Paris-Bordeaux and Berlin races, and ask whether I was mistaken. As a matter of fact, Bucquet's ride to Bordeaux was still more marvellous than the public guessed, for had he not met with a severe gash to his inner tube, necessitating a long delay before obtaining a new one, he would have done the whole distance in twelve hours, twenty-four minutes less than the superb record of Rivière. I had the pleasure of conversing with these two riders a few days ago in Paris, and hence these facts. In conclusion I would say, let any one learn in an hour or so the theory and details of a petrol motor, and then, in two days after possessing a Werner, all the fair land of England lies within easy reach of this admirably designed and rapid little marvel.—Yours truly,

A. L. BENETT.

A DANGER ON THE ROAD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think it would be well to draw the attention of County Councils, District Councils, and perhaps more especially the Parish Councils to the existing and dangerous way drivers of horse vehicles have in hilly districts of blocking heavy cart-wheels and vans and wagons with large pieces of rough wood, flints, or part or whole bricks. I am quite in sympathy with giving the animals a rest, but it is the way their drivers leave the blocks on the road, to the discomfort and danger to life of cyclists, motorists, and drivers of other horse-drawn vehicles, which should be prevented. Why not compel each heavy vehicle to have a back roller, as is adopted in some parts of the country? Even a piece of wood with handle might be carried and a place made under carts or wagons to receive it, so that the drivers would always have it with them. Trusting something may be done very soon.—Yours truly,

ROADSTER.

RELIABILITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am surprised to see most of your correspondents, in relating their experiences of runs, having something to say of valves needing adjusting, brakes going wrong, and many other defects besides tire troubles. Six months ago I bought a Glasgow built car, and since the first week I have gone out and come in without any trouble whatever on the road, and have run close on 3,000 miles—often over 100 miles a day. Last week I went from Barrhead to Musselburgh, through Glasgow, Coatbridge, and Edinburgh, fifty-four miles, making the return journey without a single stop.—Yours truly,

WALTER CREBER.

A USEFUL HINT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The following little incident might interest some of your readers. Whilst out on my car the other day I chanced to

get a puncture; my brother and I removed the tire, and were about to mend it, but found we had no solution. Being about five miles from the nearest village, we were in despair; when suddenly I remembered that petrol was a rubber solvent. Finding a piece of electrical binding rubber, we put it in a tin box, poured some petrol on it, which readily dissolved it. This making some very fair solution, we mended the tire, which is still holding up well.—Yours truly,
A. C. S.

A HINT FROM MARGATE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to draw the attention of your readers and any motorist visiting Margate to the disgraceful way in which the cab and wagonette drivers drive. They usually drive on the wrong side of the road, and in other ways endeavour to cause accidents with motor-cars. Now that the electric trams carry passengers who would otherwise pay their iniquitous charges, they try their best to put down any other modern methods of locomotion. I would suggest that any motorist or cyclist having trouble with the cab or wagonette driver should take his number and report him to the police.—Yours truly,

C. P. C.

"M. M. C. S.," writing from Christiania, Norway, states:—"I should be very glad to hear the experience of users of petroleum oil motors and locomobiles. I have used an oil motor in my auxiliary boat for four years and am perfectly satisfied with it, but should like to know how it works on the road."

MR. HENRY LEITNER, of Accumulator Industries, Ltd., writes:—"In your interesting description of an electric vehicle's long distance run, you omit what I think most people would consider the main feature. It is no doubt interesting that the vehicle in question now looks graceful and that the present batteries only occupy a reasonably small space. It is also gratifying that instead of a "driver with a companion being perched on the two tiers of batteries" there is now proper seating accommodation. But how about the small and powerful accumulator that rendered all this possible and accomplished the phenomenal run of 94½ miles? By omitting its name—an old "Leitner" C.U. 6 battery of 50 cells, the main point of importance is left out, the battery having been constructed about 18 months ago.

A RUSSIAN motorist is about to travel round Russia in his car, visiting St. Petersburg, Pskow, Riga, Warsaw, Moscow, and the more important towns of the Empire.

Mr. A. R. SHATTUCK and Mr. J. Dunbar Wright, president and vice-president, respectively, of the Automobile Club of America, have just completed an automobile tour from Paris to Geneva, Berne, Basle, Strasburg, and back to the French capital.

THE concluding Saturday run of the 1901 summer season of the Automobile Club will take place to-day (Saturday). Mr. Roger W. Wallace, K.C., Chairman of the Club, has invited the members and friends accompanying them on their vehicles to take afternoon tea with him at the "White Hart" Hotel, Windsor. The start will take place at 2.30 p.m. and the route followed will be via Richmond Park, Kingston Bridge, Sunbury, Shepperton, Chertsey, Laleham, Staines, and Old Windsor.

DURING the Royal Agricultural Show at Cardiff so much interest was taken in Mann's patent steam lorry, that it was arranged that it should be tried in actual work. The trial was a thorough success. The lorry steamed out of the show ground to Spillers and Bakers' mills, where it was loaded with five tons of flour in bags. It then left with its load and proceeded to Cowbridge, via Bute Road, St. Mary Street, and over Canton Bridge. It went well, and without a single hitch, doing Tumble-down-Dick Hill with the utmost ease, travelling at the rate of five miles an hour. Down hill it was absolutely under control, as shown by the way it ran into Cowbridge. The lorry was put up in the market yard, where the tanks were filled with water ready for the return journey. Leaving Cowbridge at 4.45 the vehicle kept up a good speed of five miles an hour, arriving in Cardiff about seven o'clock.

A NOVEL SPARKING DEVICE.

A NEW mechanical igniting device for petrol motors which has been introduced by Mr. J. V. Rice, jun., of Edgewater Park, New Jersey, is just now attracting considerable attention in motoring circles in America. It consists of a small steel cup, the bottom of which is filled with mercury. A cap is fastened on the top, and through it a small plunger is moved up and down by means of a rod attached to the crank shaft. At each stroke the point of the plunger dips into the mercury; on

withdrawal it makes a vigorous spark, or, in other words, a spark in which there is a maximum amount of current. Looking at the break through a sight hole it appears more as a small dense flame than a spark. One charge of mercury will, it is stated, last for some time, the oxide of mercury being carried off by the engine as it gradually forms. The plunger is threaded nearly its entire length, which enables a close adjustment to be made for the mercury at any depth. The device has been tested on a De Dion motor under all speeds up to 2,340 revolutions per minute with, it is stated, very satisfactory results.

MR. W. H. BUXTON, of Southport, has now opened a depot in Liverpool, at 57B, Bold Street, where Locomobile steam cars will be kept in stock.

OVER fifty automobiles participated in the Massachusetts, Automobile Club's run from Boston to Massapoag Lake, Sharon, Mass., recently. Other cars came from Providence, R.I., bringing the members of the Rhode Island Club. In all, ninety vehicles and 210 passengers reached Sharon.

MR. CROKER, Chief of the New York Fire Department, has expressed himself strongly on the imaginary dangers of gasoline, or petroleum spirit. "Parlour matches," the Chief declares, "cause more fires than gasoline, and some deaths every year, yet no one thinks of prohibiting their use. Gasoline is no more dangerous in use than many other substances of like kind when handled properly. As to the use of gasoline in automobiles, I consider it almost absolutely safe. I have been using it myself for a year and a half, and have never had an accident with it."

MOTOR-CARS AT BRIGHTON.

THOSE who visit Brighton are able to become well acquainted with the reliability and the other advantages of the motor-car. The town is admirably situated for the use of the automobile, and the numerous places of interest a few miles away give the opportunity for the institution of public services that are certain to be popular. Rumour is busy with talk of additions to the existing motor-car services in the town, and in a year or two Brighton will be enjoying further prosperity from the advent of the motor-car. A few notes on what is already being done may be of interest.

FIG. 1.—THE KOPPEL CAR WITH BODY REMOVED AND DOUBLE FRAME SEPARATED.

The Sussex Automobile Company is the name of one of the leading concerns, and Messrs. Duck and Harris are responsible for its operations. As a whilom manager of the Brighton branch of Humbers, and also as one who introduced the automobile to Cambridge, Mr. Duck is well known; while Mr. Harris was a sufficiently famous champion cyclist of the county to be still remembered in that capacity. They have established workshops in the Western Road with business premises immediately opposite, and their selection of cars include a Daimler 'bus, two and four seated Locomobiles, De Dion voituresses, Pieper cars, Progress motor-tricycles and cars, Ariel trikes, and several French vehicles. Running the concern on somewhat similar lines to those of the Shaftesbury Avenue depots, Messrs. Duck and Harris are doing much for automobilism in Sussex.

Mr. Lonsdale (originally Messrs. Monk and Lonsdale) has removed to Waterloo Street, Hove, thus carrying the business into a fashionable suburb. He has a large connection in repair work, and a Burns' car was among the vehicles shown there a few days ago.

Dealing only with the trade, the Motor Fittings Company, represented by Mr. Easton, has an agency at 28, North Road, and is thus a factor in familiarising visitors with the motor-car.

Fine show rooms on the King's Road front are being opened by the Brighton and South Coast Motor Company, and the position of the concern will contribute to its success.

Char-à-banc services with Daimler cars are organised by the Madeira Motor-Car Company, whose store rooms are in the Madeira Road. Mention should also be made of the engineering works opened by Mr. Werotte, one of the partners in the Times Motor Company, who spent much time in introducing a steam car of their own construction. A private trade in oil launches is done by Messrs. Tucker and Stonham, who own three such boats themselves, one or other of which is often to be seen around either of the piers. A few miles away, at Worthing, a Daimler car at Warne's Hotel has been fitted with a Creese self-starter, which appears to work admirably.

Automobilists will find it advisable to secure petrol and advice from any of these firms when visiting the southern seaside resort, as skilled *mecaniciens* and experts in automobile matters will give the benefit of a wider experience than could be offered by the tradesmen in other lines who are now showing a tendency to store petrol.

THE KOPPEL PETROL CAR.

ONE of the latest Belgian cycle firms to take up the construction of automobiles is the Compagnie Belge de Velocipedes, of Liege, who are now constructing vehicles on what is known as the Koppel system. A novel feature of the car is that the frame is built up of two distinct parts (Fig. 1)—one carrying the motor and transmission gear, and the other the steering mechanism. One of the advantages claimed for the arrangement is that in case of any repairs being necessary, either part can be detached without interfering in any way with the parts of the other. The engines are of the vertical type with water-jacketed cylinders and fitted with electric ignition. A governor is also provided, the speed ranging from 600 to 1,600 revolutions per minute, the normal rate, however, being from 900 to 1,200 revolutions. The carburettor employed is of the constant-level spraying type. A feature of the device is that no hot air is used, resulting, it is claimed, in a greater impulse being given to the piston at each explosion. The water-tank has a capacity of sixteen litres; the circulation is maintained by a pump and radiator, the latter being located in the rear of the frame. The engine is geared direct to the rear axle, the crank-shaft, change-speed gear wheels and differential gear running in an enclosed oil bath. The makers claim that 80 per cent. of the power developed by the motor is given off at the rims of the road-wheel. Another feature of the car is the method of attaching the body, any type of which can be fitted to the frame.

It is connected by bolts at the rear and by hinges at the front, and can be raised up at the back, to enable any small repairs to be carried out. Steering is controlled by a horizontal hand-wheel, on the standard of which are two sectors, one carrying the handles controlling the ignition and the governor, and the other the lever actuating the change-speed gear. The engine is started from the driver's seat by means of a lever, at the right of the steering column. Ample brake power is provided, while

FIG. 2—GENERAL VIEW OF KOPPEL CAR.

the wheels, which are 80 c.m. diameter at the rear and 60 c.m. at the front, are shod with pneumatic tires. In the particulars sent us by the company no mention is made of the horse-power of the engine adopted.

CONTINENTAL NOTES.

BY "AUTOMAN."

AUTODROMES are the order of the day. In Belgium there is already a project of creating one on the site of the battle of Quatre Bras, near Waterloo. It is proposed to have a course five kilos. long, of which two kilos. will be flat and straight, and the remaining three hilly; there will be a hill with a gradient of 1 in ten. The autodrome will not only be used for races, but also for private trials. In Italy, the Chevalier Tonietti and the Marquis Bourbon del Monte, of the Italian Automobile Club, propose to found an autodrome at Padua. I learn that there is also a project under consideration in Paris to make a very large race-course for automobiles, with good roads and bad roads and even paving-stones. The land will be fenced in, and a charge for admission will be made.

accident, the three Mercedes cars that started would have finished, which is saying a good deal.

THE Dutch tour seems to have been a great success, and created great enthusiasm amongst the peasants, who had most of them never seen a motor-car before. There were no accidents to mar the pleasantness of the tour, and medals and prizes of different kinds were won by Werner bicycles, and Peugeot, Darracq, Daimler, De Dion Bouton, Mors, Benz, and Delahaye cars. Somehow or other Panhards seem to have been conspicuous by their absence.

ON Sunday, the 7th inst., the Alcohol Competition from Paris to Braisne, eighty-five miles, took place. The winners were as follows:—Heavy cars, Gillet-Forest, on a Gillet-Forest car; light cars, Marcellin, on a Gobron-Brillié; voiturettes, Wimille, on a Darracq; and motor-cycles, Cormier, on a De Dion-

THE KING OF THE BELGIANS' 20 H.P. PANHARD CAR.

*Cliche de**[La France Automobile.]*

It is astonishing the number of Belgians who have become famous in the automobile world. The Baron von Zuylen and the Chevalier de Knyff are both Belgians, as also M. Sarazin, Panhard and Levassor's late manager. The Marquis De Dion, too, comes from a Belgian family. M. Houry, one of the active members of the Committee of the A.C.F., is also a Belgian, as are Pinson, Levegh and the brothers Mors. Three engineers of De Dietrich's are also Belgians.

If one looks carefully into the running of the Mercedes car in the Paris-Berlin race, it will be remarked that when this car has its steering gear altered, and more power in its motor, it will be very hard to beat. It must not be forgotten that the motor develops only 35 h.p., and was competing against much more powerful motors made by the French houses of Mors and Panhard and Levassor. Three Mercedes cars competed in the race, and two arrived in Berlin. The third had an accident the third day of the race, which was in no way the fault of the car; therefore it is only sportsmanlike to admit that, but for this

Bouton. A kilometre competition was also held near Braisne, when Gobron-Brillié won the first place for the heavy cars. Darracqs won in the light cars and the voiturette sections, and Cormier in the motor-cycle class.

IN connection with the Paris-Berlin race there were all sorts of complaints, unfounded, in my opinion, with regard to tampering with the cars in the nights, between their arrival and departure at and from Aix and Hanover. I heard Fournier say that his brakes had been loosened, that he had verified them on the Friday night, and on the Saturday morning found the nuts quite loose. I should think it is more likely a little oversight, and that the vibration of the road on Friday's journey had loosened them. M. Paul Meyan suggests, in *La France Automobile*, that in future races each car should be, on its arrival, completely covered with a tarpaulin, which should be fixed to the ground and sealed in such a manner that any tampering with it would be immediately detected. The following morning the tarpaulin should be taken off and the car given over to its conductor, all cleaning,

repairing and filling of water and petrol to be taken out of the running time.

TALKING of Paul Meyan, he mentions in the *Figaro* that in a conversation Fournier told him that he had won 25,000f. in money, and that Mors had given him a car exactly like the one on which he drove in Paris-Berlin, and which he values at another 50,000f.; he, therefore, gets out of the race about £3,000 in money and several cups. He is taking a month's rest at Trouville and afterwards is going over to America with Charroa.

SOME interesting figures are published in the *Annales des Ponts et Chaussées* with regard to the roads. There are 38,000 kilomètres of national roads in France, and 2,375 kilomètres in Algeria. The departmental roads are 47,000 kilomètres in length and cost 21,000,000f. a year to keep up. The length of the grand roads is 241,500 kilomètres, and it costs 80,000,000f. to maintain them. Thus the total length of roads in France is 328,875 kilomètres (203,902 miles) their maintenance costing 111,000,000f. (£4,440,000) a year.

THE A.C.B. announces a hill-climbing contest for Sunday, the 21st inst., at ten o'clock in the morning, on the La Sauvenière road, between Pouhon and Malchamps, near Spa. The contest will be held under the rules of the A.C.B., and only open to members of the Affiliated Clubs. There will be seven classes, namely:—First, motor-bicycles; second, motor-cycles; third, voiturettes, weighing less than 7 cwt. 3 qrs. 14lbs.; fourth, light cars, weighing less than 12 cwt. 3 qrs. 5 lbs.; fifth, cars weighing less than one ton; sixth, cars weighing more than a ton; seventh, a forced handicap between the winners of each class.

IN Switzerland there is still some difficulty with the different local authorities of several cantons. It seems strange that this little Republic, that lives, to a great extent, on the tourist, should be so behind the times as regards motor-cars. The Cantons of Graubünden and of Tessin and Uri have absolutely closed all the roads to the automobile, pretexting the danger to the general traffic.

THE cinematograph was pressed into the service of automobilism in a conspicuous manner in the Paris-Berlin race, in which an enterprising operator of this photographic apparatus established himself on the Franco-Belgian frontier. He fixed on the opposite side of the road a clock with a large face, and as the cars came by and stopped at the control the cinematograph recorded the time of arrival and every movement of the *chauffeurs*. Thus, Fournier is seen searching for papers. The great pre-occupation of all racing automobilists on arrival at a control seems to be to find their papers. This was very notably the case in the English 1,000-mile trial.

REFERRING to the decision of the A.C.F. to limit in future the weight of racing cars to one ton, the readers of the *Journal* will remember that I have strongly advocated this course in these columns. In my opinion, however, the restriction as to weight should also carry with it a clause with regard to the passenger-carrying capacity. A motor-car with a very powerful engine and carrying only two passengers is not of any practical use, and, as a matter of fact, except for racing purposes, hardly any such cars exist. Nearly all powerful cars sold outside racing circles are constructed to carry at least four passengers, and as the only use of racing is to develop the capabilities of the machine for the use of the public, it seems to me that the conditions in the racing car should, as near as possible, approach those of the car which is sold to the public.

IN reply to a question asked in the House of Commons the other night, Mr. Chamberlain stated that the Postmaster-General had not yet come to a conclusion as to whether motor-cars could be used with advantage for the mail service.

MOTOR-CYCLE RACING AT THE CRYSTAL PALACE.

THE annual motor-cycle race meeting of the Automobile Club was held on the track at the Crystal Palace on Wednesday. Several large cars were in the enclosure, including Mr. S. F. Edge's 50 h.p. Napier car. There was a fair attendance of spectators when C. Jarrott started, unopposed, on an 8 h.p. De Dion tricycle for the hour scratch race for motor-cycles for the *Autocar* Challenge Cup. Jarrott covered the miles as follows: One mile, 1 min. 35 1-5 sec.; ten miles, 15 min. 4 1-5 sec.; twenty miles, 31 min. 48 2-5 sec.; thirty miles, 47 min. 49 1-5 sec.; thirty-six miles, 59 min. 11 2-5 sec. In the half-hour he covered 18 miles 1,465 yards, and 36 miles 798 yards in the hour. Last year Machin, on a 7 h.p. Aster tricycle, covered 39 miles 234 yards in the hour. The five-mile handicap for touring motor-cycles, with engines of not more than 2½ h.p., for the *Motor-Car Journal* Challenge Cup, brought out only one competitor, C. Jarrott, who, on a 2½ h.p. De Dion, covered the distance in 10 min. 10 4-5 sec., as against Steele's 11 min. 2 2-5 sec. last year. The next event was the ten miles handicap for all classes of motor-cycles for the *Automotor* Challenge Cup, this being won by C. Jarrott on an 8 h.p. De Dion, his time being 14 min. 47 sec. as against Buck's performance of 14 min. 2½ sec. a year ago. In the mile motor-bicycle open handicap for Mr. Campbell-Muir's Cup, there were only two starters. The result of this race was:—J. Leonard, 1½ h.p. Werner, scratch, 1; J. Lamb, 1½ h.p. Werner, scratch, 2. Won by half a lap. Time, 1 min. 53½ sec.

THE London and Counties Distributing Company, Ltd., who are running a daily service between London and Tunbridge Wells, have just obtained another 4-ton steam motor-wagon, from Messrs. Julius Harvey and Company, Queen Victoria Street, E.C. The cars are doing the journey in excellent style, and the Distributing Company, who have throughout shown so much enterprise, are to be congratulated upon their success.

WE learn that Mr. Goodall, manager and secretary of the Lincoln Motor Bus Company, has been appointed commercial manager to the Roadway Autocar Company, Ltd., 44, Berners-street, Oxford street, London, who are sole representatives in Great Britain and the Colonies for Mors cars and Renault voiturettes. Mr. Goodall, during his connection with the Lincoln Company, has shown himself to be a conscientious and energetic manager, and his hard work in the interests of the company was favourably mentioned at the last meeting by directors and shareholders alike. We wish him success in his new appointment.

A PORTABLE self-propelling bakery specially intended for military purposes is the latest novelty in the automobile world. The idea is due to M. Schweitzer, of the Société Française de Meunerie et de Panification (Schweitzer) of Paris. The bakery consists of a motor-lorry carrying mixing, kneading and other machines, and a four-wheeled trailing car on which is carried the baking oven. The bread-making machinery is driven by the same engine which propels the car, it being disconnected from the latter when the desired place has been reached and connected up to the machines. Two hundred and twenty pounds of bread per hour can, it is claimed, be produced by this portable plant.

SEVERAL motor-cycle races were held at the Manchester Wheelers' sports at Fallowfield on Saturday last. It was expected that Messrs. C. Jarrott, S. F. Edge, and G. Hunt would be among the competitors, but the two first named gentlemen did not put in an appearance, Mr. Cecil Edge competing in the two matches that had been arranged for them. In a two miles motor cycle (5 h.p.) race, Edge beat Hunt by 200 yds. in 3 min. 45 1-5 sec. Edge was also successful in a mile motor cycle match (5 h.p.), beating Hunt by half a lap in 1 min. 59 sec. A two miles motor cycle handicap race (limited to 5 h.p.) resulted as follows: W. Andrews, Stretford, 1; W. Turner, Hulme, 2; F. Rothwell, Oldham, 3. Time, 4 min. 15 1-5 sec.

A RUN ON A GARDNER-SERPOLLET.

(BY A CONTRIBUTOR.)

IT was with much interest that I was awaiting a long-promised run on a friend's Gardner-Serpellet, and when, on a recent Sunday, its approach was heralded by the sound of a horn at my door (nothing else being audible till the smart-looking little 5 h.p. car pulled up, and one could just hear the blast of the six Swedish burners that formed its furnace) I was prepared to criticise its performance with all the severity of a petromaniac, previous experience of "steamers," at any rate of the smaller class, not having by any means perverted me from the internal combustion principle.

As we were not to start for a couple of hours the owner turned off the oil and water, remarking that it was not easy to keep up steam, or rather heat, when stopping, owing to the pressure in the oil tank running down if no one was in charge, a point which might, one would think, be remedied by an air vessel, with reducing valve, being connected with it. About two hours later, by which time the boiler was nearly, but not quite, cold, we prepared to start, filling up with a couple of gallons more water, which enabled us to see the amount of oily scum in the tank due to inefficient separation—not a large amount, and the ownersaid it was much less since he diminished the lubrication feed, which had been adjusted too freely when he got the car last winter. Having poured a dose of methylated spirit into the furnace, in less than five minutes he pronounced it ready for turning on the oil, when, with a stroke or two of the air pump, the burners promptly began to roar. In two or three minutes a few strokes of the hand pump sent up the steam gauge, and taking besides ourselves a lady and two children as passengers, we started, the car going at a good speed with its rather heavy load.

After dropping our three passengers I was invited to take the wheel, or rather handle bar, and demonstrate the ease with which the car could be driven. So with valves set at cut-off position, and endeavouring to remember (not quite successfully, as appeared later) that the right pedal opened the throttle instead of being a clutch or brake, we started again, and had opportunity of testing the brake-power on some 1 in 10 descents. By the time level ground was reached, the steering—which, by the way, is to my mind somewhat too quick—was sufficiently understood to justify a little more speed; so advancing the engine-pump lever the pressure soon rose to its limit, and the ingenious by-pass that acts as a safety valve gave signs of coming into action by a little puff of steam.

Depressing the throttle pedal, we were soon running at five or six and twenty, beyond which, being new to the car, I did not care to go, though as valves were at cut-off and pumps near their minimum throw, it would not apparently have been difficult to much exceed this. The longer pump strokes were only required when the engine was running slowly or on a hill, and it was evident that skilful management of them would obviate the necessity for much use of the hand-pump.

A little further on the inevitable dog appeared, and, misled probably by our silent approach, refused to clear the road. A hurried attempt to apply the brakes resulted in opening the throttle and a leap forward, corrected only just in time, but, thanks

to the efficient "frein Lemoine," the animal escaped with an inch to spare. We were now at the principal object of our journey—a hill with a gradient rising from 1 in 30 to 1 in 90—and taking the first part at a good pace with valves full open, began to slow down ominously as we approached the steeper portion. "Pump lever too far back," explained my companion; so, advancing it, the pressure ran up, but too late to dispense with a little hand pumping. This soon accelerated our pace, and no further manual assistance was necessary while we rushed up the steepest part at a speed that showed the capabilities of this nominal 5 h.p. car. At the summit I resigned my seat at the helm with a conviction that the troubles of steamer driving were much exaggerated, and that the future of this method of propulsion was by no means, as some would have us believe, "all behind it."

Inquiry elicited that the consumption of paraffin was about a gallon for nine or ten miles (and this in a somewhat hilly neighbourhood) which works out at little over half the cost of a petrol steamer, while the water tank will, with careful driving, last about fifty miles. This has, I understand, been increased in more recent patterns, while the "visible steam" was at no time in evidence except on the steep gradient, and then not to an objectionable extent, though the condenser consisted, apparently, of plain tubes without cooling ribs. It would be foolish to pro-

nounce an opinion on a car after a single trial; but, as far as such limited experience can enable a judgment to be formed, I have never handled one which surpassed this in the combined qualities of comfort, speed, and ease of management.

THE "AUTOMOTO" VOITURETTE.

THE "AUTOMOTO" VOITURETTE.

THE motor-cycle products of Messrs. Chavanet, Gros, Pichard and Co., of St. Etienne, France, are, under the name "Automoto," already well-known in this country.

This week we are able to give an illustration of the two-seated voiturette which the firm has lately put on the market. The frame of the car is of tubular construction and the driving power is supplied by a couple of 2-h.p. air-cooled motors, located in the fore part of the frame, driving the rear axle direct through the medium of a variable gear giving two speeds forward and a reverse. The normal speed of the engine is 1,800 revolutions per minute, but this can be varied by means of the electric ignition. Steering is controlled by a bar, while as to brakes, a foot pedal controls one on the differential, and a hand lever, band brakes on the hubs of the rear wheels. The car is very light and can, it is stated, attain a speed of 25 miles per hour.

It is stated that the Licensing Committee of the Hastings Town Council will not issue any new licenses on account of lack of stand accommodation, but will grant motor-car licenses if the applicants give up their stage coach licenses.

THE British Automobile Commercial Syndicate have secured an order from Lord Iveagh for a 24 h.p. Panhard and Levassor car. Colonel McCalmont has also placed an order with the company for an 8 h.p. Panhard and Levassor with a spider phaeton body. We understand Mrs. McCalmont intends driving the new car herself.

HERE AND THERE.

FIRST HORSE (*loq.*): "Really, my dear, these new summer hats are most becoming!"

Second HORSE (*loq.*): "Yes, dear, and there's that nasty Motor-Car the men make such a fuss about in the bonnet she wore all last winter!"

SOME experiments with a petrol motor-car of Italian construction are at present being carried out by the Fire Brigade authorities at Milan.

THE King of the Belgians arrived at Salzburg on Tuesday afternoon from Paris, and left on Wednesday morning for Bad Gastein in his motor-car.

MR. J. KIRKBY, of 18, Church Street, Preston (opposite the Parish Church, and on the direct route to the Lake District and Scotland), stocks Pratt's motor spirit, also oils for lamps, etc.

THE Walton District Council has passed a resolution to instruct the police to provide for the proper regulation of motor-cars, and has declared that if even a speed of five miles an hour is considered dangerous the driver will be convicted.

WHILST driving some friends home in his motor-car Dr. Walker met with a serious accident near Shaftesbury. For some cause unexplained the car was overturned, the doctor and his friends sustaining some serious cuts and bruises.

MR. EAN CECIL, who started last week on his motor-car from Aberdeen to London with the Hon. Leopold Canning, met with an accident by the way. The car was overturned and Mr. Cecil was thrown out and hurt his leg, fortunately not seriously.

A LINCOLNSHIRE farmer has discovered a new use for motor-cars. When not engaged in carrying its owner his Benz car is slung and made to perform the monotonous task of turning the wheel of the chaff machine that daily cuts the food for the horses on the farm.

At the last meeting of the Standing Committee of the Automobile Club it was reported that Messrs. Coulthard and Co., Messrs. Simpson and Bibby, and the Lancashire Steam Motor Company had withdrawn their signatures to the Tare Limit Memorial on the ground that they did not consider it necessary that the tare limit should be extended to over four tons.

IN trying to avoid a dog a Dunstable motorist ran the wheels of his vehicle into a trench dug for drains, with the result that his two passengers were thrown out and received such injuries as to necessitate their conveyance to Luton Hospital. The owner of the car was able to resume his journey to Stafford.

At the Agricultural Show held at Doncaster on the 3rd and 4th inst. Messrs. W. E. Clark and Co., of that town, had a big display of cycles and motor-cars. Included in the latter were a "Miniature Panhard," fitted with a *tonneau* body seating four persons, a "Raglan" motor-car to carry two or three passengers, and a "Progress" voiturette.

THE motor-car has played an important part in Austrian politics. A vacancy occurred recently in the *Landtag*, and the social democracy of Vienna pressed four motor-cars into the service of their candidate, Doctor Adler. Placarded with the name of the Doctor the four cars scoured the bye-ways of the city, with the result that the democratic candidate was returned by a large majority.

A GREAT deal has been written in the Press from time to time as to the precipitous character of Porlock Hill, in North Devonshire, and the impossibility of an ordinary motor-car ascending it. It may be of interest, therefore, to mention that Mr. Herbert W. G. Goff, touring into North Devon from London on his 7 h.p. Panhard car, with two passengers and a quantity of luggage on board, recently successfully ascended the hill. The climb was accomplished on one of the ordinary 7 h.p. Panhard carriages, without being prepared in any special way.

THE Belgian Automobile Club has written to all its members with regard to the organisation of a tour round Belgium at the end of July or at the beginning of August, asking which route they would prefer and how many days.

NEW PRINCIPLE AUTOCAR, LIMITED, is the title of a company which has been registered, with a capital of £100, to carry on the business of motor carriage, cycle, and vehicle makers, etc. The registered office is at New Broad Street House, E.C.

THE Health Committee of the Liverpool Corporation are provisionally authorising the City Engineer (Mr. Brodie) to order from the Lancashire Steam Motor Company, Limited, Leyland, six motor vehicles at a cost not exceeding £600 each.

DOCTOR MOSELEY, of Ipswich, has for the last three weeks been using a smart Benz Victoria fitted with a hood, and declares himself delighted with it. The car was supplied by Mr. A. F. Garnham, a local agent.

HYTHE has, after much discussion, licensed one motor-car and two qualified drivers for public service. It is proposed to connect the town in time with Folkestone with six cars, each of which, it is stated, will make three journeys to one by horse-drawn omnibuses.

IN connection with the race meeting to be held in conjunction with the North of England cyclists' camp at Harrogate on Bank Holiday, August 5th, a two-mile motor-cycle handicap race is to be run off. The competition will be open to machines with motors of not more than 4 h.p. Two prizes are being offered.

THE Western Duryea Manufacturing Company has been formed to establish works in Los Angeles for the manufacture of motor-vehicles of various kinds. This is the first factory of the kind to be established in Southern California, and it will be under the management of Mr. O. C. Duryea, a son of the well-known C. E. Duryea.

IN connection with a gymkhana which is to be held in the grounds of the Isle of Wight College, Ryde, on the 25th inst., it has been arranged to hold two motor-car competitions. An effort will be made to get some of the county councillors and magistrates together on this occasion for the purpose of demonstrating to them the power drivers have over their motor-vehicles.

THE Electrical Power Storage Company, of 4, Great Winchester Street, E.C., the makers of the E.P.S. batteries, are issuing an illustrated booklet in connection with their extensive exhibit at the Glasgow Exhibition. Some idea of the magnitude of the work undertaken by the company may be gathered from the views of plant supplied to various corporations, of which the book consists.

AT the last meeting of the Roads and Traffic Committee of the Automobile Club arrangements were made for the erection on Birdlip Hill of special danger boards, warning motor-car drivers of the dangerous nature of the hill. A sub-committee, consisting of Colonel Crompton, Mr. Calthrop, and Mr. Shipman, was also appointed to prepare a scheme for traffic regulation for submission to the Chief Commissioner of the Police.

IN connection with the proposed run of the Automobile Club to Portsmouth at the invitation of the Mayor, which was announced to take place on Friday and Saturday, 26th and 27th inst., it has been decided to postpone this until the end of the season. It is considered improbable that a successful run could be organised during the present month owing to the absence from town of a large number of the members of the Club.

AT Edinburgh last week about twenty motor-cars belonging to the Edinburgh Autocar Company, Limited, were sold by public auction. The cars were built by the Daimler Motor Company and the Motor Manufacturing Company, Coventry. There was a considerable attendance of buyers, including several from London, Brighton, and other places in the South. Prices for six Daimler wagonettes, in running order, of 6½ h.p., and seated for ten passengers, ranged from about £100 to £155 according to the condition of the vehicles. A Lifu steam car, seated for eighteen passengers and having engines capable of developing 25 h.p., realised only £105.

THE "BIG EVENT" OF 1901.

THE 500-miles trial of reliability, which will take place at Glasgow from September 2nd to the 6th, has every prospect of being a big success. It is being organised by the A.C.G.B.I. with the co-operation of the Scottish Automobile Club, and will be held officially under the auspices of the Glasgow International Exhibition Committee, who will give medals for the successful vehicles.

The principle underlying the rules is that the trial is a trial of reliability. There are to be three hill climbing trials. In these, speed will be an important factor, but, in calculating the marks to be given, the cost of the vehicle and the number of passengers carried will also be important factors. Excepting in these hill-climbing trials no advantage, from the point of view of marks, will be obtained by a vehicle which travels at more than ten miles an hour. Marks will be deducted for all stops other than compulsory stops, stops for traffic, or tire troubles. Speed in excess of that required to gain the maximum marks (viz., ten miles per hour on the open road, and eight miles per hour or less in traffic) will therefore be useless, except during the three hill-climbing trials. The Judges' Committee will, however, take into consideration many points in connection with the construction and behaviour of the vehicles. The number of cars of any particular type and horse power entered by a manufacturer or agent is limited to two. The trial is open to tourist cars only. Racing cars will not be admitted.

There will be three sections, as follows:—Section I.—Motor-vehicles, entered by manufacturers or by authorised agents. Section II.—Privately owned vehicles entered by members of the Club. Section III.—Parts of motor-vehicles, entered by their manufacturers or authorised agents. Sections I. and II. will be divided into five classes, viz.:—Class A.—Cars declared at a selling price of £250 or less, with seats for not less than two passengers, including driver.—Class B.—Cars declared at a selling price of more than £250, but not more than £350, with seats for not less than three passengers, including driver.—Class C.—Cars declared at a selling price of more than £350, and not more than £500, with seats for not less than four passengers, including driver.—Class D.—Cars declared at a selling price of more than £500, with seats for not less than four passengers, including driver.—Class E.—Motor-cycles for two persons or more.

If there be shown a necessity, special classes will be made for light delivery vans, heavy motor-vehicles, public service vehicles, and electrically-propelled vehicles, for which there will be special routes and separate awards. Section III.—The parts which may be entered are:—Class A.—Tires, pneumatic, fitted to vehicles weighing with loads 17 cwt. and under. Class B.—Tires, pneumatic, fitted to vehicles weighing with loads 21 cwt. and over. Class C.—Tires, solid, fitted to vehicles weighing with loads 21 cwt. and over.—Class D.—Wheels. Class E.—Springs. Class F.—Axles.

The number of cars of any particular type and horse-power entered by a manufacturer or agent shall be limited to two. The entrance fees in Section I are: £30 per vehicle if paid after Monday, July 1st, at 12 noon, and before Thursday, August 1st, at 12 noon. £40 per vehicle if paid after Thursday, August 1st, at 12 noon, and before Saturday, August 24th, which is the final date of entry. The entrance fee for delivery vans and heavy vehicles is £20 up to August 1st, at 12 noon, and £25 after August 1st, and before August 24th, at 12 noon. The entry fee in Section II. is £5 per vehicle if paid before Thursday, August 1st, at 12 noon; which is the final hour

for entering. It must be understood that the owners of vehicles entering in Section II. are entirely responsible for the provision of a suitable observer and the payment of his expenses. In Section III. the entrance fees are as follows:—Class A, tires, £25 per set. Class B, wheels; Class C, springs; Class D, axles; £10 per set. To be paid before 12 noon on Thursday, August 1st.

The trials will comprise certain hills on which separate records from those of the day's run will be taken of the time occupied by the various vehicles in making the ascents. The marks awarded for the hill-climbing trials will be based on a formula in which speed, number of passengers carried, and price are the factors.

The Judges' Committee will hold special tests on Saturday, August 31st, and at other times, to ascertain whether the trial vehicles are fitted with sufficient brake power, and specially whether the brakes are so constructed that they will prevent the vehicle from running backwards if stopped on a steep up gradient. Certificates given in connection with the trials will be endorsed with a statement as to the efficiency of the brakes, as regards backward as well as forward running.

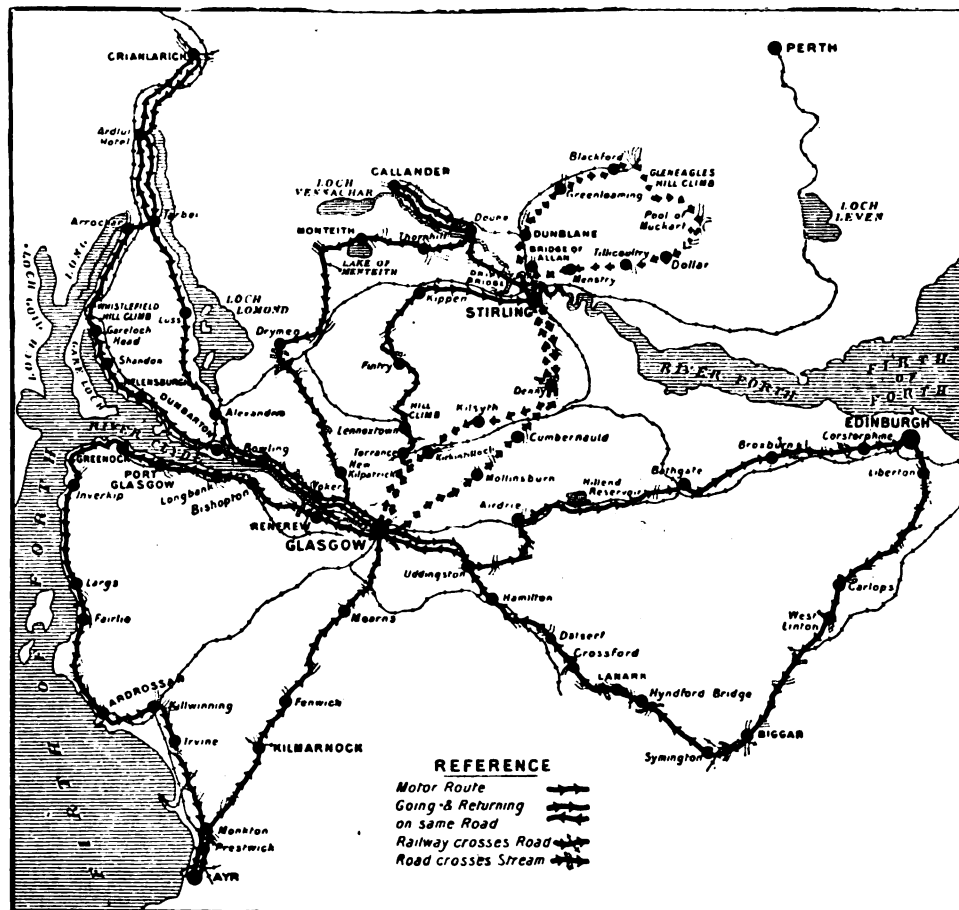

The Council of the Glasgow International Exhibition will give the medals on the recommendations received through the Sports Committee of the Exhibition from the Judges' Committee appointed by the Automobile Club:—Section I.—Gold and silver medals, as first and second prizes in each class. Section II.—Privately owned vehicles; silver commemorative medals to the owners of vehicles which successfully complete the trials. Section III.—Parts; a gold and silver medal, as first and second prizes in each class.

The Judges' Committee, in arriving at their decisions, will give marks principally on the results of the trial, but will also take into consideration:—(a) Price; (b) weight; (c) h.p., shown by performance; (d) persons carried, or load; (e) price in proportion to seating capacity occupied; (f) price in proportion to power of motor; (g) power in proportion to seats occupied; (h) power in proportion to weight; (i) mechanical efficiency as shown by hill-climbing trials; (k) simplicity of transmission; (l) accessibility of mechanism; (m) quality and sufficiency of speed gear; (n) easiness of adjustment; (o) steering

gear; (p) brakes and brake gear; (q) ignition arrangements and apparatus; (r) general design, mechanically; (s) general design, appearance; (t) workmanship, especially of machinery; (u) condition of car at end of trial; (v) breakages and defects not previously mentioned.

Certificates will only be given in respect of the vehicles which have made an average of not less than eight miles per hour on the total trials, after deducting loss of time in controls, by tire troubles and by compulsory stops.

If a competitor in Section II. desires to obtain an official certificate from the Judges' Committee, he must comply with the rules which govern vehicles in Section I. as regards date of arrival in and departure from Glasgow, display of his vehicle nightly at the Glasgow Exhibition, its custody in the Club storage building, defined time and number of persons for replenishing fuel, lubrication, and adjustment, etc., etc. An owner in Section II. may, however, elect to obtain only the records of daily runs and hill climbs, and a commemorative medal. In such cases, all that is required is that he shall be present with his vehicle at the daily starts, with an observer, and shall run through the trial, generally conforming to all the regulations except those governing the control of the vehicle from the finish of one run to the commencement of the next. His record will be specially endorsed to the effect that the Judges' Committee have no knowledge as to what repairs (if any) were effected, or changes made in the vehicle between the daily runs, as the vehicle was in the hands of the owner and not in the custody of the Judges' Committee.

MAP OF ROUTES.

The Club will give certificates to drivers of motor-vehicles who may successfully and properly drive a vehicle throughout the trial, provided that the vehicle shall successfully accomplish the trial.

Competing vehicles must be in Glasgow at the place appointed on Friday morning, August 30th, at 10 a.m., otherwise they may be disqualified. The vehicle will then be marked by the Judges' Committee. From that time, no part must be replaced before Saturday evening, September 7th, unless notice in writing of such change be delivered to the observer or Club secretary or his deputy within twelve hours of the change being made. Infringement of this rule will entail disqualification.

Competing vehicles will be displayed daily in the grounds of the Glasgow Exhibition from the conclusion of the run until 10 p.m., or such earlier hour as may be hereafter announced.

On running days the start from the Club storage building will take place at 8 a.m. precisely. Vehicles will be started from the Club Storage building on the first day (Monday, September 2nd), in sections, and in the order in which they are entered. On subsequent days they will be started from the Club storage building in the order of their taking rank, and will keep that order to the outward control, where they will be restarted in the same order at two minutes intervals.

Before the beginning of each day's run, a vehicle, in addition to the time necessary for it to run from the Club Storage building to the clearing enclosure, will be allowed on arrival at the enclosure half an hour for cleaning of carriage work only, and half an hour for replenishing fuel, lubricating, and adjustment. One mark will be deducted for every minute occupied in replenishing fuel, oiling, lubricating, and adjustment in excess of the allowance of thirty minutes. If a piece be replaced the driver must so inform the Club secretary in writing under pain of disqualification. The Club will endeavour to make arrangements for fuel to be supplied in the cleaning enclosure.

The vehicles must remain in the Club Storage at Glasgow all day on Saturday, September 7th, for examination by the Judges, and must not be removed without authority.

Every town and village through which the route may pass will be a control, and unless otherwise stated in the route-directions, will be deemed to commence at the first house of such town or village adjacent to the route, and to similarly end at the last house of such town or village adjacent to the route. The carrying of spare outer covers of pneumatic tires attached to or on a motor-vehicle during a trial run is prohibited.

Every motor carriage shall bear a metal plate on the front and a plate at the back. Such plates each to measure eight inches square, and to have painted on them the official number of the vehicle or part. These number plates with numbers thereon may be obtained at the Automobile Club (free) between Monday, 19th, and Saturday, August 24th.

Mr. Claude Johnson, the Secretary of the Club, has been recently in Glasgow preparing for these trials. After travelling over a number of suggested routes, and after considerable discussion and careful consideration, a series of roads have been selected, of which we publish an admirably compiled map. This gives the whole of the various routes for each day in the clearest manner. The daily routes will be as follow:—

Sept. 2. Glasgow—Edinburgh—Glasgow, total distance, 116 miles.

Sept. 3. Glasgow—Ayr—Glasgow " " 107½

Sept. 4. Glasgow—Callander—Glasgow, 96½ miles, including " hill-climbing test beyond Lennoxtown.

Sept. 5. Glasgow—Stirling—Glen Devon—Stirling—Glasgow, 95½ miles, including hill-climbing trial at Gleneagles.

Sept. 6. Glasgow—Crianlarich—Glasgow, 115½ miles, including hill climbing test beyond Gareloch Head.

Although from the report of the Secretary it appears that nails on the road are very numerous, and promise a good deal of trouble for those vehicles fitted with pneumatic tires, the roads generally around Glasgow are excellent for the purposes of the trial, especially in view of the intention of the Committee that it shall be one of reliability and not a trial of speed.

FURIOUS DRIVING CASES.

At Yarmouth Alfred Henson was summoned for driving a motor-car at an excessive speed along the Marine Parade recently. The case was proved by Sergeant Mason and Constables Legood and Fish, all of whom said defendant was driving at a furious pace despite the fact that many people were about. Defendant said he had no idea of the rate he was travelling at, but he had the machine well under control, and could have stopped it dead if he wished. He saw no people in the way, and did not know he was exceeding the regulation pace. The magistrates fined defendant, as it was the first offence, 10s. and costs, and the Chairman remarked they could have fined him £10.

At Chelmsford County Sessions, George Kahn, of London, was summoned for driving a motor-car between Ingatestone and Chelmsford at a greater speed than twelve miles an hour, on Sunday, June 30th. Police-sergeant William Cowell stated that the defendant's motor-car passed him at Ingatestone at 11.26, going at about twelve or fourteen miles an hour, but before he lost sight of it the speed, he believed, had been increased to twenty miles an hour. Witness went to the police-station and telephoned to the police at Chelmsford. Afterwards, he compared watches with P.C. Beesley by telephone, and they both agreed. The

distance from Ingatestone, where he saw the motor, to the Shire Hall, at Chelmsford, was six miles. Inspector Peters calculated that the defendant travelled at the rate of twenty-one miles an hour from Ingatestone to Chelmsford. P.C. Beesley deposed to stopping the motor-car in High Street, Chelmsford. Defendant gave evidence to the effect that he left Hampstead at eight o'clock, and stayed on the way for half an hour for breakfast. The distance from Hampstead to Chelmsford was about thirty-four miles, and he arrived at the latter place at 12.43. He did not know what time it was when he passed through Ingatestone. A fine of £5 and 3s. costs, was imposed.

At the Stipendiary's Court at Fenton, Harold Keates Hales, cycle agent, Burslem, was summoned for furiously driving a motor-tricycle to the danger of the public. Police-sergeant Dowler found that defendant covered 300 yards in less than half a minute. Mr. J. Hughes, rate-collector, Burslem, said that the machine could not be driven at more than ten miles an hour, and that the roads traversed had gradients of one in twelve and one in fifteen, up which the machine was travelling. The Stipendiary said this evidence was absurd, and he did not believe it. Defendant was fined 20s. and costs.

At Chepstow, Dr. Charles Corben, of Caldicot, was summoned for furiously driving his motor-car, to the danger of the public, at Mathern. Police-constable Hiron alleged he went from eighteen to twenty miles an hour, so that witness had to get off his bicycle and get to the side of the road out of the way. Defendant, who had been twice previously warned by the police, was fined £1 and 8s. 6d. costs.

At Brentwood, Charles Bluemel, of Forest Gate, was summoned for driving a motor-car down Brook Street Hill, Brentwood, at a greater speed than twelve miles an hour. The police estimated the speed at twenty miles an hour. For the defence witness denied that the speed was more than twelve miles an hour, and counsel protested against the police guesses as to speed being accepted as evidence. A fine of £3 and 17s. 6d. costs was, however, imposed.

At Brentwood last week, Leonard Beadle was summoned for driving a motor-car at a greater speed than twelve miles per hour. Mr. Staplee Firth, solicitor for the defendant, submitted that there were two gentlemen on the Bench who were not fit and proper persons to try the case, because they had shown distinct bias on the subject. Police-constable Taylor, for the prosecution, said the car was travelling over twenty miles an hour. Mr. Firth: Didn't you go out specially hunting motor-cars on this particular Sunday?—No, sir. How many did you bag?—There are two here, sir. How many did you report?—I decline to answer. That is police business, sir. The clerk held that the question need not be answered. The witness estimated the width of the courtroom at 40ft., whereas it is actually 24ft. He denied, however, that he had made as great a mistake in judging the pace of the motor-car. Mr. Frank Davey said the pace was not under twenty miles an hour. The defendant, on oath, said he was an experienced motor driver. He had driven at least 17,000 miles in London, and had never had an accident or received a complaint. On this day he drove from Blackheath to Southminster and back. There were five persons on the car. The speed was about eleven miles an hour. Thomas E. Quick, Wm. Whiteway, and Wm. Whiteway, jun., gave similar evidence. Mr. Firth said he confidently asked the Bench to dismiss the case. The Chairman: We are satisfied about the case, and there will be a fine of £3 and costs 18s. 6d. Mr. Firth asked for a stay for seven days, saying he should move for a special case. He should like to have the view of the Bench on the question that mere opinions were not evidence, which was granted.

At Southampton, three summonses were heard against motorists for proceeding at excessive rates of speed in the Avenue, Southampton. Chief Constable Berry explained that he had had two officers on duty in the Avenue in order to time the rate at which the motor-cars referred to travelled. The officers took up positions a quarter of a mile apart with watches regulated exactly alike. When the cars passed the first officer he held up his hand, and the second recorded the time when the cars passed him. Dr. Griffin, of Southampton, was the first defendant. He appeared, and was represented by Mr. Lamport. The police evidence was to the effect that Dr. Griffin did the "quarter" in his motor-car in fifty seconds on July 4th. The Act provided that the speed should not exceed fourteen miles per hour, and the above rate was equal to between sixteen and eighteen miles per hour. Defendant did not contest the evidence. His advocate said this was practically the first case of the character that had been before the Court, and submitted that payment of the costs would meet the case. The Bench adopted this view, and dismissed the information on payment of the costs, 4s.

The second defendant, J. W. Dowgall, of Southampton, did the "quarter" in a motor-car in forty-five seconds on July 4th, equivalent to between eighteen to twenty miles an hour. Mr. C. Martin appeared for the defendant, and the Bench dealt with defendant in the same way as they had done in the first case.

The third defendant, Mrs. Peach, of Byfleet, Surrey, did not appear, but was represented by Mr. Lamport. She, according to the police, covered the quarter in thirty seconds on July 6th. It was stated that Mrs. Peach's motor was proceeding down hill at the time its rate of progress was estimated; the other two cars were going up hill. Chief Constable Berry pointed out that this was the most serious of the three cases. The Bench, however, dealt with the summons as they had done with the other two.

At Epping, Lord Carnarvon was summoned for furiously driving a motor-car on June 23. Police-constable Sutch said that at 6.30 p.m. on June 23 he was standing outside the Blacksmiths' Arms at Thornton Common when the defendant went past in a motor-car at the rate of twenty-five miles an hour, and failed to pull up when witness held out his hand and called, "stop!" Two other witnesses corroborated. Lord Carnarvon gave evidence on his own behalf. He had travelled in motor-cars over a distance of 40,000 or 50,000 miles in England, France, and other countries. On this occasion he was driving a small Panhard. It was fixed at half-speed and it was impossible to exceed 10½ miles an hour. While passing the constable he was going about eight miles an hour because the axle was heated and he feared a collapse. The collapse actually occurred before he got to Epping. He saw the constable holding out his hands, but did not understand what he meant. His Lordship offered to give the magistrates a practical demonstration of the speed of the machine. The offer was declined. In reply to Mr. R. Bury, his Lordship said he would give £500 to anyone who would drive the machine at a speed of twenty miles an hour. Mr. McCreery, who was with Lord Carnarvon in the car, and two machinists named Cross and Trotman supported the Earl's statement. The Chairman said the magistrates thought the witnesses for the prosecution were mistaken as to the speed. It was a difficult thing to estimate. In arriving at this conclusion they did not cast any reflection on the police. The summons would be dismissed. A summons against Trotman, the Earl's engineer, who occupied another car, was also dismissed.

At Ridgway, Mr. Ernest Brown was summoned for driving a motor-car at excessive speed. The defendant stated that he had the machine under such control that at a speed of fifteen (not twenty) miles an hour he could pull it up within a distance of five or six yards.

At Kingston, Charles Tournier, of The Beeches, Walton, was summoned for driving a motor-car at a speed greater than twelve miles an hour at Oatlands Drive, Walton, on June 29th.—P.C. Gamlin stated that the defendant was driving at a rate of from twenty to twenty-five miles an hour. On being stopped later in the day, defendant admitted that he was travelling sixteen miles an hour.—P.C. Gamlin, in reply to the Chairman, said that the defendant was not only going more than twelve miles an hour, but was travelling to the danger of the public. It was dinner-hour, and there were several children about, who narrowly escaped being run over. Superintendent Boon said that he had received several complaints about this particular motor-car. The Chairman said it appeared to him that the result of the furious driving of motors in this neighbourhood would result in their all being numbered, and then the owners of the cars would only have to thank those who drove recklessly. In this case the Bench must convict, and the penalty would be £5.

At Farnham, Surrey, William Hobbs, who admitted a charge of driving his motor-car at too rapid a speed at York Town and Frimley, was fined 40s. and costs, and cautioned that on a second conviction a much heavier penalty would be imposed.

At Lymington, Thomas Burt, of Totton, cycle agent, was fined £1 and 11s. costs for driving a motor-bicycle furiously on the Brockenhurst Road, on the 15th ult. Defendant pleaded not guilty. P.C. Pollard stated defendant went 1,065 yards in 1min. 40sec., at about the rate of twenty-seven miles an hour.

At Lancaster, Thomas Head was summoned for furiously driving a motor-tricycle on the road between Parton and the Longlands Inn at 9.30 on the night of the 7th inst. A police officer said he timed the defendant, who travelled at the rate of twenty-five miles an hour. The defendant said that the tricycle could not travel at that speed; that he was putting oil from the reservoir tank into the engine at the time, which always had the effect of slowing down the machine, and that, as a matter of fact, he had to pedal to get the machine over the rising ground before he reached the Longlands Inn. The Chairman said the magistrates had personal experience of the pace motor drivers went along the road, and twenty-five miles an hour was an unreasonable speed. A fine of £5 and costs, or in default a month's imprisonment, was imposed.

PANHARD-LEVASSOR.

In the Chancery Division of the High Court of Justice, before Mr. Justice Farwell, on Monday, the case *La Société Anonyme des Anciens Etablissements Panhard et Levassor v. the Panhard-Levassor Motor Company (Limited)* and others, was heard. The plaintiffs in this action are a company constituted under French law in 1897 in Paris, in succession to the former firm of Panhard et Levassor. They alleged that the words Panhard-Levassor and Panhard were universally known in the trade of the United Kingdom and elsewhere as exclusively designating the goods, and particularly the motors and motor-cars manufactured and sold by them and their predecessors in business, and that they had the exclusive right to the use of those names in such connexion. The defendant company was registered in May, 1900, with a capital of £100. The plaintiffs alleged that the seven defendants, F. G. Exell, F. R. N. Kent, F. C. Dawson, W. Bustard, F. W. Stiff, H. H. Idle, and P. W. Evannett, who were the signatories of the company and the only shareholders, wrongfully and fraudulently and with intent to injure the plaintiffs, conspired to form and register the defendant company. They further contended that, by the

existence of the defendant company, the public and purchasers and users of motor-cars in the United Kingdom and elsewhere would be led to believe that the defendants were carrying on business as agents for the plaintiffs; that the public and users of motor-cars would be deceived by being induced to purchase or use motor-cars or parts thereof manufactured or sold by the defendant company as and for those of the plaintiffs; that goods inferior to those of the plaintiffs could be produced and sold and used under a name so colourably resembling that of the plaintiffs, as to be calculated to deceive the public; and that the plaintiffs would be prevented from registering themselves as a company under their own name, or from registering a company under a name similar to their own to carry on business as their agents or otherwise. The plaintiffs accordingly claimed (1) an injunction to restrain the defendants from using the names of Panhard and Levassor, or either of them, or any title or description including those names, or otherwise colourably resembling the name of the plaintiffs in connection with the manufacture, use, or sale of, or other dealing in motor-cars or parts thereof; and (2) an injunction to restrain the seven individual defendants from allowing the defendant company to remain registered under its present name or any such title or description. The defendants alleged in answer that the use of the word Panhard or Panhard-Levassor referring to a motor was understood in the trade to refer merely to the general type of car, and not to the manufacturers; that a Panhard or Panhard-Levassor car might be known as a German Panhard or a French Panhard and so on, according to the country of origin, or, if a special type Panhard car were made by a particular maker, by the name of that maker in addition to the name Panhard or Panhard-Levassor. They also contended that the plaintiffs were manufacturers in Paris of motor-cars made under a group of patents taken out in France to protect a system of making motor-cars known as the Daimler system, the English patents relating to which system were owned by the British Motor Company, and that the plaintiffs had no licence from the British Motor Company to import into or deal with in England cars manufactured under the Daimler patents in France. As the defendant company intended to acquire licences to manufacture and sell in England motor-cars constructed according to the Daimler patents, the defendants stated that the object in forming the defendant company and another company, known as the Panhard Motor Company, was to prevent the British Motor Company from granting a licence to any other person to trade in England under the name of Panhard. They denied that the defendant company had as yet manufactured or sold any motor-cars, and submitted that, if and when they did, they would not infringe any patent or other rights which the plaintiffs might have in this country.

Mr. Justice Farwell, in delivering judgment, said that the plaintiffs were a well-known firm of European reputation. They had no agency in England until last December, but they had sold motor-cars in England indirectly, and Englishmen had purchased their cars in France and brought them over to this country. He held that they had proved that England was one of their markets. The defendants had registered a company under the name of Panhard-Levassor. It was alleged that they had done so in order to shut out the plaintiffs, but he could find no sort of excuse or justification for the use of the plaintiffs' name. He had been in some little doubt as to whether he could grant relief against the seven individual defendants, who seemed to constitute the whole company, there being no other shareholders. It would, however, be unfortunate if a company could be formed to do illegal or fraudulent acts with no one liable except the company. He thought that in the circumstances relief against the company involved similar relief against the seven defendants, and the plaintiffs were entitled to the injunctions claimed with costs.

THE AUTOMOBILE CLUB'S QUARTERLY 100-MILE TRIAL.

The quarterly 100-mile trial of the Automobile Club was held on Tuesday, the 2nd inst. The usual route was followed, viz., from the 2nd milestone from the Marble Arch, via Ealing, Uxbridge, Beaconsfield, High Wycombe, and Stokenchurch to the 52nd milestone (outskirts of Oxford), and back. Total: 100 miles. The roads were in good condition on the outward journey, but, returning, were very heavy. Roads were up in Ealing, which congested the traffic and impeded progress. The weather was fair in the morning; heavy rain fell in the afternoon.

The hills on which hill-climbing trials took place were:—(a) The steep portion of Dashwood Hill, commencing at 33rd milestone and ending at danger board at the top—1,180 yards, having an average ascent of 1 in 16.0 and including 352 yards of 1 in 10.9; (b) One mile including Dashwood Hill, commencing at the 33rd milestone and terminating at the 34th milestone, having a total rise of 241 feet in 1 mile, including 275 yards of a gradient of 1 in 27.7 and 600 yards of a gradient of 1 in 11; (c) Aston Hill on the return journey; distance 1 mile 1,100 yards, having a total rise of 316 feet and including 1,910 yards of a gradient of 1 in 21.

Only two vehicles took part in the trials, as follows:—

A Humber voiturette (Humber, Ltd., Coventry), fitted with De Dion motor having cylinder 3½ in. diameter by 3½ in. stroke, the weight complete, but without passengers, being 12cw.

The following are the results as given by the observer:—

Speed on outward journey including time occupied by all stoppages.—Up to the legal limit of twelve miles per hour.

Number and cause of stoppages.—Two stops in ascending Dashwood Hill, and run abandoned owing to breaking of piston at end of forty-seven miles.

Hill-climbing speeds.—(a) The steep portion of Dashwood Hill:—Time, to danger board, 15 min. 30 sec. = 2.5 miles per hour. (b) One mile, including Dashwood Hill:—For the mile 17 min. = 3.5 miles per hour.

After passing the thirty-third milestone, and on ascending Dashwood Hill, two passengers alighted. Half way up Dashwood Hill the motor stopped for 7 min. 10 sec., and restarted with two on board including driver. Five minutes later it again stopped for half a minute. Sixty yards from the forty-ninth milestone the car again stopped, and on examination it was found that the piston was smashed, and the trial had consequently to be abandoned.

A 4½ h.p. De Dion voiturette, to seat three, entered by Mr. J. M. Gorham. The results obtained were:—

Quantity of petroleum spirit used on the journey.—3 gals. 3 qtrs.

Quantity of water used on journey.—3½ pints.

Average cost of fuel per mile at 1s. 3d. per gallon.—56d. per mile.

Speed.—Up to the legal limit of twelve miles per hour.

Number and cause of stoppages.—At fifty-second milestone car was stopped for 5 min. 43 sec. to lubricate and fill petrol tank.

Hill-climbing speeds.—(a) The steep portion of Dashwood Hill:—Took three passengers up all the way except for 11 1-5 sec. during which one passenger alighted, as the car was forced to take the worst side of the road. Time, to danger board, 4 min. 48 sec. = 8.3 miles per hour. (b) One mile, including Dashwood Hill:—Took three passengers up all the way. For the mile 5 min. 52 sec. = 10.2 miles per hour. (c) Aston Hill:—Took three passengers up all the way. Time, 10 min. 4 sec. = 9.6 miles per hour.

NO LIGHT.

At Chelmsford, Robert Charles P. Knight, motor-car engineer, of Chelmsford, pleaded guilty to driving a motor-car at night without exhibiting a red light in the reverse direction to which he was proceeding. —A fine of 2s. 6d. and 6s. costs was imposed.

MISTAKEN IDENTITY.

At Ipswich, Charles Warren was charged with furiously driving a motor-car. —On Tuesday evening P.C. Morris, who was on the Cornhill, saw the defendant approaching from Westgate Street with two others in a motor-car. The constable estimated that defendant was driving at eighteen miles an hour. —A cabman, named Whyatt, deposed to the car being stopped by Morris, who stood in front and held up his hands. —He estimated the speed at fifteen miles an hour. —The defendant said he had never before been stopped by a police constable, and suggested that on the present occasion the constable was mistaken. A car driven by a Frenchman had been repaired by his employer (Mr. Botwood), and he suggested that individual, who was trying his car through the town, had been mistaken for witness. —Colonel Josselyn said the Magistrates believed it was a case of mistaken identity. There was no doubt the car was driven furiously, and had the right person been summoned, he would have been fined. The case against the defendant was accordingly dismissed.

CURIOUS POINT OF LAW.

In the Aberdeen Sheriff Court, William Hepburn was charged with driving a motor-car at a rate of between twenty and thirty miles an hour along one of the principal streets in Aberdeen on 16th ult. The charge was brought under Section 6 of the Light Locomotives on Highways (Scotland) Regulations, 1896, made by the Secretary for Scotland. Accused pleaded not guilty, and his solicitor submitted an objection to the charge to the effect that Section 6 was not in force at the time of the alleged offence. According to the section, it was specifically laid down that it must be brought before both Houses of Parliament, and the Secretary of Scotland, when written to on the subject, had admitted that that was not done. As a matter of fact, the Section was not brought before the Houses of Parliament until Monday last. The Sheriff adjourned the case for a week in order that the Procurator-Fiscal might answer the objection.

WEIGHT OF RACING CARS.

In view of the proposal of the Automobile Club de France that the weight of racing cars should be limited, the following letter was addressed to Chevalier Rene de Knyff, the President of the Commission Sportive of the A.C.F., as far back as the 31st May last (six weeks ago) by Mr. C. Johnson, the Secretary of the A.C.G.B.I.:—

"Please permit me to thank you for the courtesy and kindness extended by you to me and other members of this Club during our recent visit to Paris. Constructors here are anxious to know whether the suggestion that the weight of motor-vehicles for races held under the rules of the A.C.F. should not exceed 900 kilograms is to come into force, and, further, whether the rule will be applied to the race for the Gordon-Bennett Cup. Some of the constructors are anxious to begin to design carriages in order to have them ready for the Nice races held under the rules of the A.C.F. If the weight limit rule be adopted, it must necessarily affect the construction of racing carriages in other countries.

I suppose your Committee could not see its way to hold a conference on this question in Paris of the representatives of the various Clubs before your Committee come to any decision. You will see for yourselves that the question is of international importance.

"As regards the Gordon-Bennett Cup I presume that the rule cannot be introduced into the rules affecting this race without the concurrence of the members of the International Commission. Two or three of our constructors here appear to think that the best results would be most easily arrived at by there being no limits. You will, I am sure, recognise the importance of a decision being come to at an early date, as, until such decision is arrived at, the designing of racing carriages must be at a standstill."

Owing probably to the heavy work which fell to the lot of the Commission Sportive in connection with the organisation of the Paris-Berlin Race, no reply to this letter was received. Last week, however, Sir David Salomons, the chairman of the Foreign Relations Committee of the A.C.G.B.I., visited Paris and represented to members of the A.C.F. that, leaving the Gordon-Bennett Race out of the question, if the A.C.F. intend that the rule as to weight limit should apply to races organised in countries other than France, the opinions of the Automobile Clubs of countries other than France should be considered, and, if necessary, an international conference should be held.

The representatives of the A.C.F. most courteously and readily fell in with this suggestion, and on Monday last the Club secretary of the A.C.G.B.I. saw M. de Knyff and arranged that the matter should be discussed by the A.C.G.B.I., and its opinion communicated to the A.C.F. without delay. Consequently, a conference between the Races Committee, representatives of manufacturers and all members of the Club who may be interested in this question, will be held at the Automobile Club, 4, Whitehall Court, London, S.W., on Wednesday next, the 24th inst., at 4.30 p.m. It is hoped that all manufacturers will be represented, whether they may or may not have any present intention of competing in races, so that the question may be discussed by those most competent to deal with it. In the event of manufacturers not being able to attend, they are invited to send their opinions in writing as to whether the proposal to limit the weight of racing cars to one ton is or is not desirable.

FATAL ACCIDENT.

An inquest was opened at Haslemere, by Mr. Coroner Roumieu, on the body of Thomas Pash, gas-fitter, of Waterloo Road, London, who died at Haslemere Cottage Hospital from injuries sustained in a motor-car accident when descending Hindhead. The deceased was one of a party of banqueters taken by their employer, on Saturday last, to Hindhead in three motor-cars. In coming down Hindhead the driver of one of the cars ran into the bank and overturned the vehicle whilst steering clear of some horses grazing in the road, the thirteen occupants being pitched out. The deceased was picked up insensible, but none of the others were seriously hurt. The inquest was adjourned until Friday.

THE A.C.F. have decided to accord, in commemoration of the Paris-Berlin race, the large bronze plaque to Mors, and medals to Panhard and Levassor, Renault Bros., De Dion-Bouton and Company, Henry Fournier, Etienne Girard, Louis Renault, and Osmont. The press have not been forgotten, and Mr. Georges Prade of the *Auto-velo* and Mr. Paul Meyan of *La France Automobile* have also been accorded medals for their help in defending the rights of the industry.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, JULY 27, 1901.

[No. 125.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

LIKE many another provincial town near a great city, yet unable to derive the smallest benefit from that proximity, owing to the sluggish ways of its railway, Maidstone has watched with envious eyes the development of the London and Tunbridge Wells motor-car service. Traders and farmers of the district have now called

in the aid of the London and Counties Distributing Company and are going to have a service of their own. The company has approved of a motor-wagon constructed by a local firm, Messrs. Jesse Ellis and Co., which has in a recent trial shown to great advantage. With a 3-ton load a trip was made to Sittingbourne, *via* Detling Hill, which has a gradient varying from 1 in 6 to 1 in 10 for close on a mile. In spite of this the wagon reached its destination with only two stops for oiling in three hours. Thus will Maidstone give impetus to new local industry whilst fostering the old.

The Mabley Car.

WE had the opportunity last week of inspecting a somewhat novel type of light car, about to be put on the market by Messrs. John Marston, of Wolverton. Though a four-wheeler, it embodies the principle of double steering, the arrangement of the four 26 in. wheels being somewhat that of the old Coventry rotary sociable, the fore and aft ones—nearly but not quite, in the same track—steering, while the two on the main axle are the drivers, it being claimed that by this arrangement side-slip is impossible. The body resembles the two halves of a *tonneau* arranged longitudinally, the two passengers sitting somewhat as on the Pennington torpedo, and the rear one steering, with the ignition, gas, air, and compression levers under his hand, together with the two speeds and a starting handle. The length of the car is 7 feet, and width over all 43 inches, the engine being a 2½ De Dion, with water-cooled head, for which a 2½ h.p. is, we understand, to be substituted in the standard type. This drives, through a belt, a pair of pulleys in the rear of the main axle, and connected with it by chains with a loose pulley between, somewhat as in the 3 h.p. New Orleans. The engine is placed over the front wheel, and an ingenious spring suspension enables all four wheels to remain on the ground in spite of irregularities. As may be gathered, the little car has about the proportions of a quad, but the seats are roomy and comfortable, and the design at least does not err on the score of want of novelty.

Motor Accidents.

THESE, as it is perhaps still necessary to reiterate, are exceedingly rare, the more so when we consider the increasing number of drivers undergoing their novitiate; and the fact that each accident of any gravity is brought to the attention of every automobilist in the kingdom, as it is hardly exaggeration to assert, will enable them, at any rate, to realise this. It is gratifying, however, to find that the Press generally is ceasing to give that undue prominence to motor mishaps that

it denies to equally serious accidents of other kinds. The very fact that the spread of automobilism has thrown into increased relief the unreliability and risk attaching to the horse, though temporarily prejudicial, is having its effect in making converts to the safer and speedier means of progression. We have of late repeatedly heard the owners of troublesome horses express their intention of abandoning them for a car, which, with other indications, encourage a hope that the cloud—literal, as well as metaphorical—at present threatening will give way to the sun—or should we rather say the “phare Blériot”?—of (rapid) progress.

A Caution.

SUCH danger as there is, however, may arise from a cause to which it is worth while drawing attention. Improvements of many kinds can frequently be made in old cars, which considerably increase their efficiency, while the performances of more modern ones habituate us to speeds which we should have formerly been very cautious of approaching. But frequently the brake-power and reliability of steering in such old vehicles have not been correspondingly improved, making them risky at what we now consider merely moderate speeds, and as the pace at which a car can go on down grades only depends on the driver's state of mind, his diminishing respect for milestones may lead to what, under the circumstances, is recklessness; to say nothing of considerations as to the ability of the vehicle to stand increased strains.

Round the World on a Motor-Car.

MR. MAURICE ROBINSON, of New York, proposes to start from Calais next spring on a round-the-world motoring tour. The vehicle selected for the enterprise, and which is now under construction, is of the Turgan-Foy caravan order which recently toured so successfully in Algeria. Mr. Robinson will be accompanied by one mechanic, and will carry a liberal supply of stores, which will be replenished by a French firm at certain points along the route. Leaving Calais in May, it is proposed to proceed to Moscow, *via* Paris and Berlin. From Moscow the line of the great Siberian Railway will be followed to Vladivostock. Ship will be taken from there to Japan, and, that country crossed, America will be reached by sea. Though America has not yet been crossed by a motor-car, Mr. Robinson hopes to do so and thus secure a double first. From New York steamer will be taken to Liverpool, the easy run from there to Dover completing the world's conquest.

Motor-Cars in Manœuvres.

During the cavalry manœuvres held in the neighbourhood of Aldershot this week the motor-car made its *debut* as an auxiliary to war. Mounted on a 7 h.p. Panhard, General Hemming directed the movements of his cavalry force. Four motor-wagons were also used for transport, and carried loads ranging from three to seven tons with the utmost ease. Of these, three were propelled by steam and one by petrol. Other cars on the ground comprised a 16 h.p. Napier and a 12 h.p. Daimler, which were employed in running from column to column with urgent orders.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

American Customs Duties on Motor-Cars.

THE Secretary of the United States Treasury Department has decided that automobiles taken into the United States, even for temporary use, must pay the duty of 45 per cent. The question came up in a letter from the Chairman of the Automobile Club of America, who asked that certain automobiles that were to be taken over from England, France, and Germany, for the purpose of engaging, incidentally, in International speed contests at the Pan-American Exposition, be allowed to enter free of duty, on the understanding that they were to be exported when the owners returned to their respective homes. The Secretary declined to allow this, but stated that if the machines had been in use for a period of one year or more before being brought over by their owners, they could be admitted free as household effects. If they are new they must pay the duty.

The "Ivel" Motor-Bicycle.

ONE of the features of the automobile world at the present time is the increasing attention which is being devoted to motor-bicycles. The number in use is steadily progressing, with the result that quite a number of cycle firms are beginning to take up their construction. Among these is Mr. Dan Albone, of Biggleswade, who is now turning out machines on the

lines of that depicted in the accompanying illustration. As will be seen, Mr. Albone has followed the lines adopted in the Minerva and Excelsior motor-bicycles, the engine, of $1\frac{1}{4}$ h.p., being carried below the lower tube of the frame and connected by a strap to a pulley on the rear wheel. The machine complete weighs 70 lbs., and can attain a speed of about twenty miles per hour. The Ivel bicycle has a long standing reputation for high quality, which will, we feel sure, be fully maintained in the motor-bicycle turned out from the same works.

The Autodrome and its Alternative.

It is now generally conceded that facilities for speed trials unavailable (except at prohibitive rates) on the public roads, are an urgent necessity if we are to compete with other countries in the design and building of automobiles. Not, of course, that racers are wanted for ordinary use; but the experience gained in building them is undoubtedly of supreme value, and without the incentive afforded by races many improvements that are directly applicable to economic ends, and many more that are indirectly so, would never have seen the light. The idea of a race-course *pur et simple* was suggested some time ago, and first appeared in these pages; while the alternative of a motor road, primarily for ordinary use, subject to occasional reservations for racing purposes, was due to Mr. Scott Montagu, and has many claims for consideration. In the first place, given a suitable locality, the economic advantages of a straight road

with good surface and easy gradients have been over and over again shown to repay their cost, and the large traffic that would in time be attracted to such might reasonably be expected to prove profitable, the more so in consideration of greatly diminished cost of upkeep, though the effect of the wheels of powerful cars, at the very high speeds now attainable, on ordinary road surfaces may well be more than is commonly supposed, and can hardly be comparable with the slight effect of speeds under thirty or thirty-five miles an hour. On the other hand, a course for racing only need merely involve the construction of eight to ten miles of road, and while less interesting, perhaps, to the competitors, would offer far more attractions to spectators, who could see the progress of a race at five or ten-minute intervals, while there would be less inconveniences in the way of its use for private trials, which should form an important part of its *raison d'être*. In any case, the increasing attention paid to the schemes suggested is bringing them at last into the field of practical politics.

The American Automobile Club's Endurance Test.

REVISED rules have just been issued by the Automobile Club of America with regard to the 500-mile Endurance Contest they are organising. The contest will be international in character, and will start from New York on Monday, September 9th, and will terminate in Buffalo on the afternoon of the following Saturday. Competing vehicles will be divided into five classes, viz.: (A.) cars weighing under 1,000 pounds, (B.) cars weighing between 1,000 to 2,000 pounds, (C.) cars weighing 2,000 pounds and over, (D.) motorcycles, and (E.) public delivery vehicles. Awards will be made on average speed for the six days, and any competitor falling below an average of eight miles an hour for any period will not receive credit for that period. No credit for speed exceeding fifteen miles an hour will be allowed, and all competitors will be required to conform to State laws concerning speed. The total distance will be divided into stages for each day on a basis of approximately eighty-five miles per day. Each day's run will be subdivided into two periods. Controls or checking stations will be established at the starting and finishing points of each period. First, second, and third class certificates will be issued at the termination of the contest, according to the average speed made by competing vehicles.

An Automobile Bank.

ON the Continent the "small savings bank" idea has been developed to much greater extent than in this country, and agricultural credit banks are popular institutions in almost every rural community. They are likely to be further developed by the aid of the automobile, for an automobile bank has just been inaugurated at Mézières—a little town in the Ardennes. Should the venture prove half as successful as the promoters imagine it will, the extension of the novel idea throughout Belgium, and thence to other parts of the country, will be only a question of time—and a short time too. A motor-car has been fitted up with strong box, cash books, registers, clerks, etc., and will tour the district surrounding Mézières, gathering in the savings of the people. At the present time many of the people of the locality continue the primitive way of hoarding their savings in stockings and out-of-the-way corners, while the journey to the nearest town is rather a long experience to the distant labourers. Seeing that an automobile has been introduced in the new system of a wandering banker, we do not anticipate a "run" on the bank by many of the peasants.

Attend to Cars.

MOTOR-CARS are not exponents of perpetual motion—nor will they run for months without being overhauled and properly looked after. The same principle is true of other forms of locomotion. Railway engines are thoroughly examined before and after a journey, and horses have to be rested and their

condition noted. So it is with motor-cars. To run a car a hundred miles, half the distance being probably along a dusty road and the other moiety through showers of rain, is a severe test which it will regard with comparative indifference. But it is rather too much to stand the car in its shed for a week without attention, and then expect it to run as freely as if it had never experienced dust or rain in its career. Motor-cars require thorough overhauling if the best results are to be obtained.

American Opposition.

IN some parts of the United States great alarm has been expressed at the violent rate at which some well-known automobilists have been racing along the roads, and the harum scarum manners of millionaire motorists threaten to seriously impede the general advance of the industry. The Road Drivers' Association of New York, which numbers fifteen hundred members, and the Pleasure Drivers' Association of Brooklyn are combining against automobilists—all because a few rich mortals have sought to endanger their lives by exciting adventures. It demonstrates what serious opposition can be raised by lack of discretion.

A Speed Recorder.

REALLY the solicitous care of good meaning journalists with regard to automobilists is quite perplexing. Thus one kind man who has recognised the unfairness of many of the methods adopted by the police to trap unwary drivers, suggests that all motor-cars should carry an automatic speed recorder of a design to be approved by the Local Government Board. It should be fixed, he suggests, in such a position as to be invisible to the driver "and would thus increase the heinousness of the offence if there was one, while giving absolute immunity from mistakes." All this is very comforting; but why cannot these young people discuss politics, or the weather, leaving motorists alone?

Long Acre.

CARRIAGE builders in this country—unlike those of the United States—have not gone into the motor-car trade with anything like universal enthusiasm, and only a few have sufficiently studied the subject to be able to find profit in its adoption. But a walk down Long Acre gives opportunity for realising how completely the automobile has changed the aspect of that thoroughfare—once solely devoted to horse-drawn carriages and vehicles. Every hour of the day automobiles may be seen in and about this leading thoroughfare, and a great many fine showrooms therein are given up to the display of motor-carriages of all descriptions.

County Councils and Motor-Cars.

AT the quarterly meeting of the Herefordshire County Council, the Roads Committee reported the receipt of a letter from the Automobile Club, with copy of a memorial from manufacturers and others protesting against restrictions on motor-car traffic, but the Committee did not see any reason for modifying the recent decision in favour of numbering and registration; they considered that the question of speed might be left to be dealt with as furious driving under the ordinary law. They were also of opinion that drivers should be licensed, and be liable to have their licences revoked upon any transgression of the law. Mr. Ballard made a protest against this recommendation, which, however, was adopted.

Puncturing Tires.

IN the early days of the automobile in this country various were the suggestions, of a more or less violent character, to stop the progress of motor-cars. One chief constable hit upon the brilliant plan of placing trees across the roadways that motor-cars were likely to traverse, and in some of the out-of-the-way villages of France even more wicked methods were occasionally adopted. Now this vicious feeling towards a new

industry seems to have extended to the United States, and the population, as well as the rural authorities, along the Boston post road in Connecticut are reported to be so determined to stop the fast racing of the millionaire motorists along that thoroughfare that, if necessary, they will resort to bullets. These are not to be aimed at the drivers, but at the tires of the cars, with a view to puncturing them, and so impeding their progress. If one or two of the bullets went astray it might be a useful lesson for all concerned.

More Records.

FRANCE has done some good things in the way of record breaking this year, but the recent performance of a scorching motorist and a police court magistrate established three more of an interesting order. M. Hautier, the well-known automobile builder, appeared before the magistrate to answer four summonses for the offence of furious driving alleged to have been indulged in during a period of three days. The second record was purely financial, the four summonses being disposed of for 1, 2, 3, and 6 francs, respectively. M. Hautier, having thus secured his two records, courteously held the watch whilst the magistrate established one on his own account by inflicting 196 fines for similar offences in the marvellously short time of 1 hour 45 minutes 25 seconds.

A SNAPSHOT AT WINDSOR ON SATURDAY LAST.

Motor-Car Repairs.

MOTOR-CAR repairing establishments are opening up in every city of the land, but competent automobile repairers are still scarce. Various tradesmen whose experience is entirely foreign to motor engineering have suddenly blossomed out into full-fledged motor-car experts, and are leaving unmistakable marks of their incompetence upon the vehicles entrusted to their care. It is not uncommon for an automobile, which merely required some slight adjustment or replacement of parts, to receive at the hands of these men a thorough "overhauling," with the result that serious and complete derangement follows, and the owner is put to much trouble and expense to have his car set to rights again. No man is competent to make a specialty of repairing motor-cars unless he is familiar with their construction as well as their operation. Motorists should endeavour to select some mechanic of reputation in their town who will become interested in their car and be able to make such repairs to it as may be needed. If there is a newly-opened repairing shop in the vicinity, an automobilist would be well-advised to assure himself of the competence of the repairer before he entrusts his car to him. The little adjustments he should learn to make for himself, and, above all, he should remember that "an ounce of prevention is worth a pound of cure."

A Mechanics' Institute.

THE United States is the land of organisations and societies, and the suggestion comes from New York for a Motor-Vehicle Mechanics' Institute. If there was such an institution the graduates of it would find profitable employment, and the benefit of such thoroughly trained care for a motor-vehicle as these mechanics could give it would be of great comfort and saving to the owner thereof. As it is now, a man not only often risks his property, but his life and limbs as well, solely because he cannot find a really competent engineer, no matter what he may be willing to pay. In the near future there will be a splendid opening for reliable and proficient mechanics able to drive and overhaul machines.

Undecided Pedestrians.

As in most other things the undecided person who halts in making a decision and stops half-way across the road is a great terror to the automobilist. The strain on the nerves of the motor man is already severe—for, what with attention to his machine and looking out for stray policemen and ownerless dogs, he has plenty to occupy his attention. But when a nervous old lady attempts to cross the road about a hundred yards ahead the difficulties of the position are great indeed. She will dodge about in the roadway like the proverbial pussy gyrating on hot bricks, and she is useful—from the prejudiced person's point of view—in adding another irritant to the much-harassed motorist.

The Turgan Caravan on Tour Again.

THE monster Turgan caravan, which rested for a while at the Agricultural Hall during the late Exhibition after a successful tour in Algeria, is on the road once more. Though not entered with the smaller fry of competitors in either section of the Paris-Berlin race it has arrived at Berlin nevertheless. The route followed was rather longer than that of the tourists, the bridge of boats by which they crossed the Moselle hardly being up to its weight of 5,400 kilos, with another thousand or so added for coal and something for passengers. The passage was, however, safely accomplished at Wittlich, and though nothing in the way of a record was established the trip is described as having been most enjoyable.

A Useful Record.

MR. JOHN M. SATTERFIELD, chairman of the Automobile Club, of Buffalo, N.Y., has offered a cup to the member who shall hand in the greatest number of different reports imparting useful information pertaining to roads, towns, stopping places, charging and supply stations, etc., in the Club's territory. In order to systematise the work of compiling such information a form of report has been prepared which all members are requested to use whenever possible. These blanks read as follows:—
 "Report of . . . Left . . . via . . . Street, at . . . arrived at . . . at . . . This piece of road is good . . . fair . . . bad . . . I believe this to be the best route between these points (if not, state why).
 . . . The grades are . . . Distance . . . ascertained by . . . Scenery . . . General remarks on road . . . The town of . . . has telegraph . . . telephone? (in hotel)? . . . Railroad . . . Ferry or steamboat connections with . . . The best hotel is . . . Rates approximately . . . Petrol can be had at . . . on week days, and on Sunday at . . . have offered to supply a continuous electric current of . . . volts . . . amperes maximum, between the hours of . . . and . . . at a rate of . . . per ordinary vehicle charged, and are willing to make arrangements to that effect with this Club. The best place for repairs to vehicle, etc., is . . . Places worthy of a visit in this town are . . . Automobiles may be stored over night at . . . Remarks: (including names of several villages passed through to indicate route taken) . . ." When long runs are made the members are expected to use more than

one form, making different reports for the various portions of the run. The reports received will be tabulated according to a chart system, and will be at all times at the disposal of members seeking information, and, at the end of each season, the information will be combined in book-form for the use of members only.

MOTOR-CARS IN JAPAN.

THE writer recently visited the leading cities near the coast in Japan, and found enthusiasm concerning the introduction of automobiles to be at its height. One might be surprised at the interest in motor-carriages manifested in Nagasaki and other places, but it must be remembered that the Japanese are far more enterprising to-day than they were formerly, and the sons and daughters of the "new" race are as desirous of keeping up with the times as the most cultivated Europeans.

When the horseless carriage was introduced, trouble was experienced at first in getting the machinery repaired in the event of a breakdown. Recently, however, machine shops have been established in which the equipments are such that the most complicated of motor-carriage fixings can be repaired and adjusted. This is the result of recent attempts on the part of American and European manufacturers to introduce their respective machines into Japan.

There are a great many persons in the Japanese empire who can afford to buy automobiles, and how to reach these people has been one of the problems with which the agencies have had to cope. There were numerous obstructions at first to importing foreign made motor-carriages into the country, but this prejudice has now been overcome in nearly all the leading commercial centres. Thus at Nagasaki there are agents who have established depôts from which they sell different makes of motor-vehicles. The tariff duty on the imported vehicles is not excessive, and as good prices are obtained, the dealers have good incomes from the sale of the machines and the care and repair of the same. The machines which the writer saw in service and in the agencies in Japan appeared to come from all parts of the mechanical world. There were many English types, while the French designs were quite prominent. There were also American makes distributed in the sales stores. At some of the agencies the different makes of machines are drawn up in line, and one can inspect and compare the machines of different countries.

The Japanese laws are peculiar in many respects. Thus, for instance, if one takes his camera with him and tries to photograph people riding in automobiles, as the writer did, he is notified by the police that it is against the law to photograph anything in the empire. There are, however, not many laws restricting riding through public streets in motor carriages. I saw them running about at good speed everywhere. They are, as yet, a novelty in the cities and towns, and persons stop and gaze upon the speedy machines as they go buzzing through the streets. The principal troubles arise at the crossings, where the thoroughfares are overcrowded. Here the Japanese police often stop the automobiles while the crowd passes. Again, the police will sometimes hold the crowd back until the vehicles rush through. The streets of many of the cities and towns are too narrow for motor-vehicles, and, although there is no law prohibiting the machines from entering the streets, the drivers usually steer clear of them. Some of the streets are laid with rounded and pointed stones, which are disastrous to rubber tires, and drivers of automobiles avoid these as much as possible. Some of the country roads are in excellent condition and riding upon them is a great pleasure.—*The Horseless Age.*

AMERICAN motorists are much interested in Mr. William K. Vanderbilt, jun.'s new motor-car, which is shortly expected to arrive from France, credited with a speed of seventy-five miles an hour. Mr. Clarence Mackay's new car, also on the way, is a reputed flier, and some exciting contests are anticipated.

ARRANGEMENTS are in hand at Ostend for the holding of an International Exhibition of Hygiene, Maritime Safety, and Fishery during August and September next. An automobile department is being organised in connection with the section devoted to sports.

A LADY'S EXPERIENCE IN THE PARIS-BERLIN TOUR.

AS we mentioned in a recent issue, Madame Lockert, proprietress of *Le Chauffeur*, was one of the few ladies who took part in the recent automobile tour from Paris to Berlin. Madame Lockert, who was accompanied by her two daughters and who rode on a Georges Richard car, has sent us the following brief account of her experience:—

"Beware all who would journey from Paris to Berlin to avoid puncture or accident of any kind at Chapelle-sur-Crécy, forty-seven kilomètres out of Paris. There our *mécanicien* toiled for one hour and a half, under a scorching sun, to repair our motor-car. On asking for a glass of water for the brave fellow, some forty or fifty idiots who surrounded the car laughed immoderately, and declared with one voice, 'There is no water here.'

"Having breakfasted on the morning of the 22nd ult. at Chaufrey, sixty-eight and a half kilomètres out, we proceeded to Reims. Tire troubles as well as our accident at Chapelle-sur-Crécy placed us near the tail end of the procession, and allotted to us the last room in the Hôtel du Commerce, where we were soon sound asleep. Sunday, the 23rd ult., we travelled splendidly through a monotonous and uninteresting country, without accident or incident till at four kilomètres from Longwy our carburettor became unsoldered and brought us to grief. I ran and searched till I saw coming along a De Dion voiturette, which we signalled to stop. The owner, M. Labbé, kindly took up our *mécanicien* and carburettor and conveyed them to the nearest tinsmith's, where the latter was speedily put in order.

Continuing our journey, we came suddenly to a height which commanded a landscape of surpassing loveliness. Longwy rose in an amphitheatre to the left, to the right a forest of tree tops stretched like a carpet under our very feet. Through this glorious scenery we sped, swift and silent, till suddenly a sharp report! A tire burst! Another loud report, then a regular *feu de joie*. What new complication, then, could these sounds of alarm herald? 'Twas no tire trouble, but Longwy signalling our arrival with cannon, and announcing the number of passengers by gun shot. A moment later and we were at the control, receiving a hearty welcome and expressions of good will from all sides as we passed the ever beautiful road into Luxembourg.

Our arrival at Luxembourg was much behind time, so with little sleep we took the road again for Coblenz. But more accidents to tires and a serious leakage of the carburettor compelled us to sleep at four kilomètres from the control at Mozelsweiss, from whence we departed the next day, Wednesday, to make a record run. We were confident of overtaking many lost hours, but at five kilomètres from Mayence our steering gear went wrong, and we had to sleep *à la belle étoile* in a forest.

To say that we had a good dinner that evening would be an exaggeration. We had fortunately some *pâte de foie gras* and biscuits and with these one could not die of hunger! It was little enough, however, and the following morning, after a rapid toilet in the forest, we sped through Mayence and Frankfort, breakfasting at Dorsinghem, and arrived at Marsbach, where we slept, without a single accident. Starting at five o'clock next morning we reached Vacha, 845 kilomètres from Paris. Here, alas! we were obliged to return to France, for we could not spare the time necessary for repairing the car, so parted from it much to our regret. We were not in the least fatigued, and regret much that time alone prevented our completing the journey.

At Cambridge there has been some discussion regarding the running of motor buses from the Post Office to the Railway Station. Up to the present nothing of a definite nature has been arranged.

AMONGST the members of the Automobile Club who have offered to place themselves and their cars at the disposal of the War Office, for the manœuvres, from the 3rd to the 10th August, are:—Mr. Mark Mayhew, 50 h.p. Napier; the Hon. C. S. Rolls, 16 h.p. Panhard; Mr. Archibald Weir, De Dion Phaeton; Mr. Noel B. Kenaley, 10 h.p. Delahaye; Mr. Shrapnell Smith, 3 h.p. Ariel quad.

A DAY'S RIDE ON A WHIPPET TRAILER.

BY the kindness of Mr. Edwin S. Cheel, I was enabled the other Sunday to enjoy a long-promised trip on the Whippet trailer, and with my host driving the Ariel motor-tricycle to which the trailer is attached, we left town at 9.30 a.m. in very threatening weather and with half a gale of wind dead in our teeth. This, though rather unpleasant, did not seem to affect the running of the combination in any way. We passed 400 odd cyclists between London and Redhill and another 250 between Redhill and Brighton, and they must have envied us as they saw us romping up the hills with ease and facing the gale without any concern. We pulled up at the Metropole at Brighton in exactly three hours from start, having gone through without a stop, the combination running beautifully throughout. After a short stay for lunch and proceeding over a villainous road along the sea front to Shoreham we paid a toll of sixpence to cross the Norfolk bridge and continued over

MR. AND MRS. CHEEL ON TRICYCLE AND WHIPPET TRAILER.

a much improved surface to Worthing, and through lovely winding avenues and perfectly level roads to the old world villages of Goring and Rustington, and along the sea front to Littlehampton. Here, after a stop of a couple of hours, we turned inland *via* Arundel and through the Duke of Norfolk's lovely park to Pulborough, Billingshurst, Ockley, Dorking, and Epsom, to town again, arriving at 8.30 p.m., having covered a distance of 140 miles. The run to town from Littlehampton was done in a little under three hours. Contrary to expectation, I experienced little or no vibration except when going fast over bad roads, and thoroughly enjoyed the trip in every way. To be taken to Brighton and for over twenty miles along the South Coast, and then whiffed home again all in the short space of seven hours seems almost marvellous to me, and has more than whetted my appetite to possess a car of my own. The tricycle and trailer ran splendidly throughout, and gave not the slightest trouble. In conversation with Mr. Cheel he tells me that he has driven this machine for over 10,000 miles, and, judging by appearances, it looks quite equal to another 10,000 miles.

CHARLES COLMAN.

A MOTOR-CAR was being driven down Paradise Hill, Margate, a few days ago, when the brake failed to act. The vehicle went down the hill at a good rate and crashed into a tramway post at the bottom. The car sustained considerable damage, but fortunately the occupants escaped without injury.

CORRESPONDENCE.

THE CREESE MOTOR-STARTER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 6th instant "Inquirer" asks for the experience of a motorist who has used the Creese system of ignition. I have much pleasure in answering this letter, and informing "Inquirer" that I have had the Creese ignition fitted to my two cylinder engines, and from the day I took the car away from the works of the company, which is now four months ago, I have not had the slightest trouble with the ignition. Personally I see very little chance of the ignition failing, especially if genuine De Dion plugs are used in connection therewith. For these reasons I strongly recommend the Creese device.—Yours truly,

H. HIGGINS.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Allow me to confirm Mr. A. L. Bennett's opinion of the Werner as a thoroughly practical and most admirable automobile, economical in working, safe, very rapid, and a good hill-climber. Some time ago, being puzzled at the conflicting accounts as to the practical working and relative merits of the different motor-bicycles, I determined to test the three best-known types for myself, and, being a tried cyclist, with a certain experience of "motoring," resolved to purchase only on the evidence of my own senses, although I was, I own, much impressed with the wonderful records of the Werner in competitive trials. The result of my tests was to rate the Werner as markedly superior to its rivals of like repute. By the courtesy of the M.M.C.'s representative, Mr. J. J. Leonard, I enjoyed two long trials of the machine. Myself and a friend subsequently purchased Werners, and we both entirely confirm Mr. Bennett's opinion, consider that the new sport is uniquely enjoyable, and, in fine, consider the Werner a marvel of speed and excellence. Ordinary cycling is poor sport beside motoring on a Werner. We find our mounts easy to groom and manage; trifling minor troubles with the ignition are about all that ever concerns us. The machines are very fast—e.g., recently I amused myself by taking part in a pursuit race on a cycle track, overhauling and passing racing cyclists and two other motor-bicycles with ease. Twenty miles an hour on give-and-take roads are easily covered, and with a security to pedestrians, etc., impossible in the case of the weighty and big motor-trike or car. It is a very safe machine for all concerned. The steering is excellent. the theoretical side-slip trouble is a mere bogey to all but clumsy riders, who are always unsafe on any form of bicycle. Personally, I have never yet slipped, though I have ridden over grease freely, and I should not hesitate to ride the Werner wherever an ordinarily good cyclist can go. The machine climbs well—particularly is this so with the 1901 pattern, which is a marked advance—and, aided by auxiliary pedalling with a sixty or seventy gear (a light and welcome exercise), will mount most Devon hills at speeds above the "legal limit" if wanted. I understand that a 2 h.p.-engined bicycle is in contemplation for next year, but meanwhile the 1½ h.p. one does very well, and I have never found it to overheat under any tests. Anything more delightful than a run on this splendidly-designed little automobile I do not know, and I have sampled many and varied pastimes at home and abroad.

I hope later, with your permission, to send a letter embodying a season's experience and suggestive of certain improvements in details, particularly as regards the "silencer," braking and pedalling gear, etc. For the present I will simply advise all purchasers to have an exhaust valve lifter fitted by the Bowden Company. This lifter ensures a very easy start, good control in traffic, very rapid cooling of the cylinder during descents, and free running when the power is cut off. We here consider it as all but indispensable, and I believe that Mr. J. J. Leonard himself is now a convert to this view. To conclude: Avoid clumsy and awkward tricycles and try the Werner, which combines the

healthful exercise (if wanted) and delicious flight of the bike with the "life" of an automobile. The front-wheel-band-drive is undoubtedly that which gets the most out of the engine, there being no waste of power in the frame during transmission, and also enables the legs of the rider to be freed from the projections, etc., which so hamper auxiliary pedalling in the case of some motor-bicycles. The motorcycle is not only practical, but it is a triumphant success.—Yours faithfully,

E. DOUGLAS FAWCETT.

GREASE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having had some little experience with a Darracq car, I find that after a run of twenty to thirty miles a large amount of grease has been wasted out of the gear box through the holes through which the spindles pass. I should be greatly obliged if any of your readers could inform me if they have had a similar experience. Also as to what grease they find best suits the purpose for which it is required, and where it may be obtained.—Yours truly,

FRANK APPERLEY.

PREVENTION OF SIDE SLIP, FORE DRIVING, ETC.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Sennett, I regret, seems to be rather—suppose I say agitated—by what I have written on the above question. It is not right to make your valuable paper the medium for personal encounters, and therefore I will do my best to confine myself to the proof of what I have advanced.

Should Mr. S.'s pet scheme be carried into practice for a racing car, I repeat, the question bristles with difficulties. Two methods, and two only, are open, viz.: First, to make both the fore and hind axles lock in conjunction about a central point for each axle, in fact like an ordinary horse-drawn vehicle only with both axles locking instead of one. This is the simplest method, but a few minutes' thought must show Mr. S. that practically it is impossible to convey the power of the engine to the wheels without bevel gearing. If he uses a petrol motor, in addition to the usual change speed gear, he will have to provide the aforesaid bevel arrangement to connect to the axles, and of course whatever device he employs each axle must have a balance gear or differential movement. Now, with regard to Mr. S.'s assertion as to complications, I think the foregoing is fairly well off, and be it remembered the steering arrangement for a car of this kind is of what is considered on the Continent the very worst. Mr. S. has ridden on a racer, and is therefore doubtless able to judge. May I ask him therefore how long he thinks his tires would keep on the wheels of a car constructed as above? I think any motor-car user or driver will tell him the steering arrangement cannot be otherwise than the Ackermann form for high speed.

Second, seeing therefore we are confined to the Ackermann axle, let us see whether we are better off here as regards actual practice. We cannot drive or steer by all four wheels in this case without a swivel arrangement to each wheel; this can be done by a pair of bevel wheels to each wheel. (This is Lacoste and Duncan's Patent, October 12th, 1896.)

Now, bevel gear is a very beautiful thing when it is in good order, well made, and well looked after. Notwithstanding, speaking from actual experience of these particular wheels, I fear Mr. S. would find it to be rather troublesome if he had four sets to look after on one car. According to Mr. Austin, one of our cleverest and best motor-car engineers, one pair of bevel wheels on a car is quite enough.

Repeatedly the attempt has been made to make the front wheels drive and steer, either by some arrangement of gearing or by universal joints. How is it we hear so little of these attempts? Speaking now as to these joints, surely it is scarcely good practice to trust to the pins of a universal joint (while at the same time, be it noted, it is in almost constant motion) to transmit perhaps over 20 h.p.? As before mentioned, four joints are required; these must allow for a locking angle of nearly a right angle, consequently a single joint is useless, and each

joint must necessarily be of the double form. In addition to the power transmission arrangements, the steering connections cannot be very simple, and when we add the usual connections of the motor, I think that my description of the underside of such a car will not be very far wrong. Mr. S.'s little joke about putting the speed lever underneath (by the way, this is an eccentricity evolved from Mr. S.'s imagination, as I never said anything of the kind) is very funny, as also the "blue haze," but I respectfully submit he has failed to controvert any of my statements. The bad language, I fear he would find, would be manufactured automatically with a car of his pet type.

As to Mr. Freestone, I sincerely hope with Mr. S. that he may accomplish his difficult task, but he should remember he is only one worker among many, as a reference to your back issues, as well as the other automobile papers and the Patent Office will amply show. No later than the Paris Exhibition a large steam-driven vehicle was exhibited by M. Gandon, wherein all four wheels are driven. (See the *Motor-Car Journal*, vol. ii., page 334). I fear I have run to considerable length and used what will be called "vain repetitions," but this is better than wasting time and money on a contrivance which after all it is safe to say will never remunerate the inventor in anything like the proper proportion.—Yours faithfully,

SIDNEY RUSSELL.

BAD ROADS AT ST. LEONARDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a constant reader of your valuable columns I noticed early in the year a request for correspondence as to the state of the roads in various parts of the country which might have a tendency to arouse local interest in the matter. Although St. Leonards-on-Sea is a very rich and prosperous town, and very highly rated, nobody without having seen would believe that its highways could be kept in such a dangerous and disgraceful condition. Not only do I wish to warn the unfortunate invalids who come and take the necessary carriage exercise, but also cyclists and motorists. The latter particularly should drive with great caution. This sad state of the highways has existed for the last two years or more, and matters seem to be getting worse. I think it is in a great measure due to the way the roads are constructed, as the stones used seem to be large, and they are rolled in at the same time as the "slosh." Of course, the road has a level appearance when just done, but soon bumps up. The authorities have been frequently applied to on the matter, but with the exception of a few hundred yards of wood pavement on the front—of which they seem very proud—they show no concern. Can any reader suggest a remedy?—Yours truly,

E. S. H.

MR. F. S. WEROTTE, of Brighton, writes:—"I notice in your *Journal*, dated the 20th July, an article on Brighton firms, in which you mention me as having been a partner in the late 'Times Cycle and Engineering Works,' and whilst in that position having spent much time on a new steam car. This statement is incorrect, as although I have taken over the works and plant of the above-mentioned firm, I have never had any connection whatsoever with them except as works manager."

MESSRS. SHIPPEY BROS., inform us that they have appointed Messrs. Haycraft and Son, Limited, of Deptford, local agents for the sale of Milwaukee steam cars and appliances for the following districts:—Deptford, New Cross, Lewisham, Brockley, Lee, and Blackheath.

WHEN horse flesh and blood can stand no more the advantages of the motor-car become apparent to the blindest.—"This hospital cannot answer any further calls. Ambulance horses are all down and others to take their places cannot be procured."—Such was the message received by the New York Police Department from one of the principal hospitals during the height of the heat wave, and what a world of unnecessary suffering it suggests. Fortunately, some of the hospitals in prostrate New York are well-equipped with motor-cars, which carried relief untiringly.

A ROTARY STEAM ENGINE FOR MOTOR-CARS AND CYCLES.

MR. A. BURGESS, of Barnard's Green, Malvern, is the designer and builder of a new rotary steam engine for motor-cars and bicycles, which combines the many advantages of marvellous running power, clean cut off, no waste of steam, general economy, and a maximum of leverage, without dead ends or centres. The illustration which we give is of a 30 h.p. engine, for which the inventor claims 75 per cent. higher efficiency than that which is usual with other engines

designed for the same purpose. Mr. Burgess is naturally chary of giving too many particulars until his specifications have passed through the foreign patent offices, but we hope at an early date to be able to publish a more detailed account. We may mention that it is possible for two men to carry the 30 h.p. engine which we illustrate, and that Mr. Burgess is building a small motor of the same type, which he intends to fit to a bicycle.

THE New York Tire Company, in issuing their new circular and price list, claim, amongst other advantages, longevity for the New York tires, they lasting, it is claimed, from two to three years. They have but one quality, the best, made from pure Para rubber. Liability to puncture is greatly reduced by their system, which consists of alternate layers of rubber and fabric and two air tubes. Two forms are made, one with a flat base for heavy vehicles, and the other with a rounded base for ordinary touring cars.

OUR Midland representative had a half day's run last week on a Centaur car. A good speed was maintained up ordinary hills, and on the level quite eighteen miles an hour was easily approached. With the exception of a little chain trouble through want of adjustment at the start, the car went through its trial without a hitch. The car weighs about 10 cwt., and if fitted with slightly easier springs, which we understand the firm intend to do, there will be less vibration felt when going over rough roads. The car is chain driven; has three speeds and reverse, a *tonneau* body, and pneumatic tires. The engine is of 5 h.p., the bore being $4\frac{3}{8}$ in., and the stroke $4\frac{1}{2}$ in. The nominal speed is 700 revolutions per minute. The motor, which is placed at the rear of the frame, is of the horizontal type. The Centaur Cycle Company, Coventry, have been experimenting with motors for some considerable time past, and will, no doubt, very shortly be placing a standard pattern car on the market.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

THE MOTOSACOCHE MOTOR-BICYCLE.

ONE of the latest novelties in the way of motor-bicycles is the Motosacoche made by Messrs. H. and A. Dufaux, of Geneva, Switzerland, a specimen of which we had an opportunity of inspecting recently at the London Auto-car Company's dépôt. The motor and all that belongs to it fit into a frame of bent tubes, which can be quickly attached to or detached from a cycle frame. On the cycle itself only the pulley for the driving belt on the rear wheel and the ignition contact on the handle-bar have to be fitted.

The illustrations show the arrangement so clearly that but little description is necessary. It may be mentioned, however, that the engine is of 1½ h.p., running at a speed of 1,200 revolutions per minute. A spray-type carburettor is used, the petrol tank having a capacity sufficient for a run of sixty miles. The Motosacoche complete weighs only 28½ lb., and is 3 ins. wide, so that it does not interfere with the free use of the pedals. It can, it is claimed, be fitted to any bicycle, and can, if necessary, be removed entirely in about a minute.

THE Liquid Air Power and Automobile Company, of Boston, U.S.A., has passed into the hands of a receiver. It was a West Virginia concern, with a capital of £300,000.

THE success of the Renault voiturette in the Paris-Berlin race is reported to have resulted in quite a rush of orders to the Bellancourt firm. The same is said of the three Belgian firms who participated in the course.

THE business of Messrs. Dennis Bros., of the Barracks, Guildford, has just been registered as a limited liability company, under the same title, and with a capital of £30,000.

A WESTERN COUNTIES TOUR.

THE following short account of a trip from London to Land's End, and across country to Wroxham, may be of interest.

My car is an ordinary 6 h.p. Daimler, which was at the time of our start geared to 25 miles, for the comparatively level roads of the Home Counties. It had been my intention to change the thirteen-tooth sprockets for something of a lower gear; but at the last moment time failed, so to Salisbury we started, overgeared though we were. Our plan was to meet the Automobile Club on their return from the Easter tour.

Arriving at the ancient and quaint city of Salisbury on Good Friday, we spent Saturday and Sunday doing some interesting short runs, the weather being too bad to make a long run comfortable. On Easter Monday we ran to Bournemouth, where, according to arrangement, we met Mr. Edmunds and Mr. Cordingley at the Bath Hotel. Mr. Edmunds turned up to time, but unfortunately Mr. Cordingley's car arrived with a damaged gear; so, determined to make the best of a bad job, we endeavoured, with marked success, to accommodate the three parties in two cars.

Doing the district around Bournemouth, we stopped at Wareham, where we were much interested and amused with the charge brought against Mr. Staplee Firth of driving "to the common danger"; and, needless to say, mightily pleased with the result. Our friends having left us, we on the following Friday started from Bournemouth for Exeter. Passing through Poole, Wareham, and Bridport, we came to Lyme Regis—a place to be remembered, as it was there that we had our first experience of a real hill; but steep as was that hill, we overcame it and safely reached the summit, although our man had to do some hard work before that desirable point was reached. We had intended taking the coast road, but getting wrong decided to run through Axminster; probably the thought of another hill like Lyme Regis had something to do with the mistake. After a delightful run through Honiton to Exeter, we arrived in good time for an excellent dinner at the new London Hotel. On Saturday we started for Plymouth, but taking the worst road reached that city *via* Ashburton, Ivy Bridge, and Plympton, encountering on the way our worst experience of weather—rain, hail, and a strong head wind. We reached the Albion Hotel, Plymouth, about five o'clock, and there we stayed over Sunday, taking a run on that day to Ivy Bridge, the weather having been so bad on the Saturday that we saw next to nothing of the country passed through. On Monday we started for Truro, going across Tor Point Ferry in a hail storm and half a gale of wind. Passing through Liskeard, we came to Lostwithiel and St. Austell. I should certainly advise anyone to keep out of Lostwithiel unless with a very low geared car; Lyme Regis was bad but this was worse—both down into the town and up out of it. In going down two out of three brakes fired and were useless. I then discovered the advantages of the extra brake which is fitted to my car, and certainly shall never be without it. I may here mention that I am no believer in a sprag, considering that the brakes should always be in such a condition that hand pressure will skid the wheels, and also that there should be a foot brake, which will hold the car on any hill, either backward or forward, and further, that in addition to these, and in the event of any mishap to them, there should be a third brake, which, in my case, is of the ordinary type, but fitted to the countershaft on the reverse side of the differential. With these three I can stop on the steepest hill and safely allow the car to go back, which I have often done to get a more favourable place to start from. Again, as my foot brake does not withdraw the "clutch," I can by only using this one brake, stop the car on a hill, and before it can run back it must turn the motor backwards, therefore, consider the extra brake much more serviceable and much more reliable than a sprag, as it is equally useful going either up or down hill.

On Tuesday we left Truro for Falmouth, and as we had

a good view of the place from the car we did not trouble to stop, but drove round and back to Penryn, *via* Gweek, to the Lizard. After lunch, and spending about two hours there, we left for Penzance, arriving about six o'clock and getting a fine view of St. Michael's Mount and the Bay *en route*. Putting up at the Queen's Hotel, we stayed two nights, spending the Wednesday in driving round Penzance and in a run to the Logan Rock. On the way to this latter place we came across another hill which strained things considerably. The best way, really, is to go from Penzance to Logan Rock and back to Penzance, as the hills are much easier that way. Next morning we occupied in a run round Newlyn, and again got amongst hills—about one in five. Here we very much surprised a gentleman—a would-be automobilist—who had been told that no car could climb the hills around Newlyn. When he actually saw my car accomplish this, to him, impossible feat he became quite enthusiastic, exclaiming "I saw you do it!" and intimating his intention of at once purchasing a motor-car. I, personally, was not so proud of our performance, as my wife was obliged to walk all the way up the hill, whilst my man pushed, and I fumed much at having come away so highly geared. After lunch we started for Newquay, arriving in time for dinner at the Atlantic Hotel. Here we stayed two nights, and it was here that we met with our first tire trouble. The tire—an old Michelin—was badly cut, and gave out. Having patched it up, I wired for another to be sent to Barnstaple. A good run through Launceston, Holdsworth, and Bideford set me wishing that I had given instructions for the tire to be sent to Ilfracombe. Within one mile of Barnstaple, however, the tire collapsed, and we finally finished up on the rim. Much to our joy the new tire arrived towards the end of dinner, and next day (Sunday) was devoted to fitting it to the wheel and a run to Ilfracombe and back before dinner. The next day (Monday) we started for Bristol, meaning to leave there before lunch the next day for Stroud. The puncturing of a back tire by a nail and filling up with petrol however upset our time table, and it was not till after lunch that we started for Stroud. Soon after leaving Bristol we had some trouble with the new tire, but after two repairs it held all right, and we reached Stroud about five o'clock. This being my native place I took friends one day to Painswick, and the next day others to Cheltenham and Gloucester. I had promised to take the landlord of the George and his wife for a run at five o'clock, and when they heard that I had started at twelve o'clock to go to Gloucester and Cheltenham they were greatly disappointed, never deeming it possible for us to get back in time; however, I was back at half-past three, and at five o'clock I kept my promise, and started with them for a run up the Stroud Valley to the top of Minchinhampton Common. In the course of conversation mine host mentioned to me that no car could be taken with safety down the Rodborough Hill. I laughed at this, and assured him it was perfectly safe, and at last he consented to return that way. We had no trouble whatever in the descent, though this hill is as bad as Birdlip Hill. I have, however, never had trouble even with Birdlip Hill, and my extra brake gives a good margin of safety. Mine host was much impressed, and quite convinced that motor-cars were more than toys, in which light he had become accustomed to look upon them. Our trip drawing to an end, as all good things too quickly do, we started at a quarter to eleven the next day for London, arriving at the Marble Arch at six o'clock. On this run I came across a nice piece of road, and timed three miles in exactly six minutes.

During the whole of this run, after leaving Salisbury, I neither touched a valve nor tightened a bolt. I was troubled a little with water in the petrol, and tightened up the chains once, but I never filled up with water more than once a day, and although, owing to water in the petrol, I had trouble with the lamps I never once had a lamp blow out. When leaving London owing to bad lubricating oil we ran badly, but getting fresh and better oil at Bournemouth we continued splendidly. After two days in London, on Sunday, the 28th April, we started for Wroxham at 3.45, going *via* Hatfield, Hertford, and Ware, to Newmarket, at which place we arrived at

seven o'clock. Soon after leaving Newmarket on Monday, the 29th April, the flinty roads caused tire troubles. We arrived at Wroxham at about four o'clock, thus finishing a most enjoyable and satisfactory trip. I found the hotels mentioned most satisfactory, and we were never charged more than a shilling per night for stabling the car. We had no special unpleasantness with drivers of horses until we reached Norfolk. That we were in that county we knew by the conduct of all in charge of horses; a more nervous set is has never been our lot to meet. They turned their horses round, covered their eyes, and gesticulated wildly on our approach. Even the drovers expected us to stop whilst they slowly drove their cattle past! All this was most amusing, though at times exasperating. In conclusion, I may say that we carried the whole of our luggage with us, and we never started before 10.30 a.m. or arrived after 7 p.m.

ERNEST ESTCOURT.

THE Pyrenean tour of the Bordeaux Automobile Club is fixed for the end of August, and is open to members of clubs and their friends. Biarritz, Pau, Lourdes, Gavarne, Bigorre, and Luchon will be visited, fêtes in honour of the event being held at the casinos of the two latter places.

THE Chater-Lea Manufacturing Company, of Golden Lane, E.C., manufacturers of cycle fittings, are now turning out a set of fittings specially intended for building up motor-bicycles. The Chater-Lea Company are only supplying the cycle portion of the machines, leaving cycle and motor experts to obtain and fit the motor and its accessories themselves.

THE Birmingham Motor Manufacturing and Supply Company, Ltd., has been registered with a capital of £5,000 to manufacture, sell, let or hire and deal in motors, cycles, cars, carriages, and vehicles of all kinds, and to carry on the business of electricians, engineers, tool makers, etc. The registered office is at 3, Temple Row West, Birmingham.

THE motor-car is in the way of bringing quite a different class of customer back to the villages, and the fact is worth the attention of those who own the soil. It would serve little purpose to leave it to the village publican himself, who cannot fairly be expected to understand what the situation requires. He needs direction, since he has little or no acquaintance with the new comer.—*Country Life*.

AN Automobile Gymkhana will be held at the Sheen House Club, East Sheen, S.W., to-day (Saturday), at 3.30 o'clock. The events, which are open to members of Sheen House Club and members of the Automobile Club, are as follows:—First event:—Starting Motor-Carriages from "Cold": The driver to start on foot 20 yards to the rear of his vehicle, run to his vehicle, start engine and race round the full course. Second event:—Bending Race for Motor-Carriages: Between staves; forwards to the last staff round which vehicle will turn and (still on their forward gear) return between staves to starting line. In heats. Third event:—Ladies' Race in Motor-Carriages: Motor-carriages to be driven by ladies, introduced by members of the Automobile Club or Sheen House Club, who may be accompanied by a gentleman. One mile. Fourth event:—Motor-Tricycle Coat and Waistcoat Race: At the end of the first lap the driver is to stop, dismount, take off his coat and hang it on a numbered peg; at the end of the second lap, take off his waistcoat and hang it up on the same peg; at the end of the third lap, put on his coat and waistcoat, and fully button both, and finish at the end of the fourth lap. Fifth event:—Obstacle Race for Motor-Carriages: Full course between gate-posts, dummies, etc., to include the opening and reclosing of a gate; and finish through a paper screen. Sixth event:—Starting and Stopping Handicap: Start from a line, and race over a straight course, and terminate over a line without touching a brick wall. Quarter of a mile. The winning carriage will be the vehicle the wheels of which (at the point at which they touch the ground) shall be over but not touching a line. If any part of a carriage touch the wall situated 4 ft. beyond the line it will be disqualified.

PORTABLE LIFTING-JACKS FOR MOTOR-CYCLES.

MANY a motor-cyclist whose machine has turned stubborn on a country road far from town or village, would have given almost anything to have had some means of jacking up the rear portion of the tricycle and so enable the

FIG. 1.—THE PORTABLE JACKS OUT OF USE.

FIG. 2.—THE PORTABLE JACKS IN USE.

engine to be tried with a minimum of exertion, and also facilitate the work of repairing punctured tires. Several portable jacks have been brought out for this purpose from time to time, but

what is undoubtedly the best we have seen is that which has been brought to our notice during the past week by Mr. W. A. McCurd, of 147, Kennington Park Road, London, S.E., and of which we are able to give illustrations herewith, Fig. 1 showing the device out of use, while in Fig. 2 it is seen in use. On the rear axle are rigidly and permanently clipped, one on each side of the motor, what appear to be two projecting rods; these consist of practically two tubes, one within the other. Within each of the inner tubular pieces is a spring, held normally under compression by a pin passing through a hole in the tube. This pin is controlled by a spring and small handle, the latter being just visible in the illustrations. To lift the rear wheels off the ground it is only necessary to pull outward the two small handles; this releases the springs, forcing the outer tubes of the projecting rods down to the ground. The rear wheels are then each in turn lifted slightly off the ground, allowing the springs and outer tubes to slightly extend further, and permitting the two pins already referred to to slip in holes towards the lower end of the inner tubes, thus making the two tubes in their lengthened form one rigid piece. With the portable jack in the position shown in Fig. 1, Mr. McCurd demonstrated to us the practicability of his device of jacking up the rear portion of his machine, from a signal given by us, in the short space of 5 secs., afterwards mounting the machine with the rear wheels off the ground and setting the engine in motion. Although not clearly discernible, the rear wheels of the machine as seen in Fig. 2 are an inch clear of the ground. When out of use the lower end of the device is in line with the bottom of the crank chamber of the motor, so that there is plenty of clearance. Mr. McCurd assures us that there is no danger of the pins coming out and so permitting the outer tubes to be forced on to the ground by the springs whilst riding, and as the whole arrangement only adds about 3 lbs. to the weight of the machine we fancy that there are many motor-cyclists who will lose no time in adding it to their motor-trikes and quads.

MR. J. C. MERRYWEATHER, writing from 4, Whitehall Court, S.W., suggests that imported motor-cars should be subjected to a severe system of government inspection.

A FRENCH General, returning to barracks at the head of his regiment after the National Review, ordered the arrest of two gentlemen whose motor-car frightened his horse. The car and its occupants were surrounded by soldiers with fixed bayonets and escorted into the barrack yard.

THE Chicago Automobile Club recently organised a demonstration to the municipal authorities of Chicago with the object of making them acquainted with the conditions of certain badly paved thoroughfares, and the control motorists have over their cars.

JENS HENRI LANGGARD, a master mariner, and also in business as a marine surveyor, of Liverpool, came up for public examination, his liabilities being stated at £419 and assets £100. From the examination by the Official Receiver it appeared that the bankrupt had become the patentee of a non-collapsible tire for motor-cars. He alleged that the patent had been disposed of to a syndicate, and that he stood to receive a large sum when the tire was taken up by motor-car makers. The examination was closed.

WHAT is claimed to be the smallest motor-car ever built is that recently made by the Jenkins Automobile Company, of Washington, D.C., for Chiquita, a Cuban dwarf, who is now using it at the Pan-American Exposition at Buffalo. The car is a little electric Victoria, an exact miniature of a full size automobile. It has 12-inch wheels, fitted with $1\frac{1}{4}$ inch pneumatic tires. The cushion measures 14 by $8\frac{1}{2}$ inches; the distance from the step to the ground is 4 inches, and from the seat to the ground 14 inches. The front and rear axles are 24 inches apart, centre to centre, and the track is 24 inches wide. With the hood up the car only reaches up to about the elbow. The motor is hung beneath the body and connects with the gear on the differential directly on the rear axle.

CONTINENTAL NOTES.

BY "AUTOMAN."

ON the 14th inst. four competitors, three of whom were on motor-cars and one on a motor-cycle, left Moscow for a race to St. Petersburg, a total distance of 693 kilometres. The race was won by Masi on a 6 h.p. Bertrand car, who did the distance in 37 hrs. 54 min. An automobile race meeting was also held at Udine, in Italy, on the 16th inst., when, in addition to an automobile exhibition, there were races along the fine wide road from Udine to Tricesimo for motor-cycles and light and heavy cars.

MR. SANTOS-DUMONT'S remarkable feat on his steering balloon is occupying the attention of the automobile world across the Channel now that the Paris-Berlin race is a thing of the past. The well-known automobilist, M. Henry Deutsch, who, by the by, is a partner in one of the largest petrol firms in Paris, has offered a prize of £4,000 to anyone who will make a balloon or a flying machine and rise from the grounds of the Aero-Club, take a flight round the Eiffel Tower, and come back and descend in exactly the same spot. Mr. Santos-Dumont has been working hard for some time past to produce a machine able to accomplish this feat, and in order to obtain power with small weight he has called to his aid the petrol motor, which connects in interest his navigable balloon with the automobile world. Last week it was decided to test the capabilities of this wonderful machine, in the free air. The result was a remarkable success, and, but for a slight defect in the working of the motor, would have crowned Mr. Santos-Dumont's effort with complete success, and made him winner of M. Deutsch's prize. At a speed of about forty kilometres an hour the balloon went round and round the racecourse at Longchamps, rising and descending at will and turning about in any direction. Mr. Santos-Dumont, finding that it was so easy, although only three cylinders of his four-cylinder motor were working, decided to attempt the flight prescribed by M. Deutsch, and set off accordingly at 6:45 a.m. He reached the Eiffel Tower in thirteen minutes, when, whilst hovering over Auteuil, another of his cylinders failed, and the balloon immediately sank until a guide rope caught in some trees. The throwing out of ballast made the balloon rise again, and, gradually, with the motor in turn stopping and starting, Mr. Santos-Dumont arrived above the starting place, having accomplished the journey in thirty-nine minutes—not quick enough, however, even had he been able to descend, to win the Deutsch prize, which prescribes thirty minutes as the limit of time. As Mr. Santos-Dumont was about to descend, his motor stopped altogether and the wind carried the balloon away towards the trees in the Baron Edmund de Rothschild's property, where it came down. Fortunately, Mr. Santos-Dumont was not in the least injured, nor was his flying machine, and he is now only waiting for fine weather to enable him to make another attempt to secure the Deutsch prize.

IN Russia experiments are being made by the War Office with regard to military transport by automobiles. If these experiments prove nothing else, they will certainly demonstrate the bad state in which the Russian roads are, and, it is to be hoped, lead to some improvement in this direction.

READERS of the *Journal* will be interested to hear that the Baron de Schwiter, whose serious accident between Hanover and Berlin was described in my account of the Paris-Berlin race, is progressing favourably and is now likely to recover from his serious injuries.

PRINCE ALBERT of BELGIUM is about to receive his new Gobron-Brillié motor-car, which is now at the carriage builders having the finishing touches put to it. He intends to take it at once to the Chateau des Amerais in the Ardennes, where he is going to stay some time.

BELGIUM is having its exhibition troubles, there being a dispute between the Société Auto-Veloce and the Chambre

Syndicale, the result of which is that the latter group, together with the A.C.B., have decided to hold an exhibition in March, 1902, in the large hall of the Palais du Cinquantenaire, Brussels, better known by Englishmen as the real ice skating rink. Curiously enough, while in England it has been decided to suppress the demonstration arena at the exhibition, the Belgians have decided to establish one in imitation of that which existed at the last two exhibitions at the Agricultural Hall.

THE HERING VARIABLE SPEED GEAR.

THE accompanying drawing shows a new variable speed gear constructed by Messrs. Friedrich Hering, of Gera, Germany, which is being introduced into this country by Messrs. Philipp and Co., of 20, Dashwood House, New Broad Street, London, E.C. The gear is of the permanent mesh type, and is adapted to give four changes of speed and reverse motion. The changes are effected noiselessly and entirely without shock by means of a system of levers actuating friction cones, motion to the levers

being transmitted by a series of grooved cams cut from the solid on an auxiliary shaft. The various changes of speed as well as the reverse motion are controlled by one lever or wheel, which actuates the cam shaft. All the gears are cut from solid steel forgings, and are enclosed in an oil-containing aluminium case. It will be noticed from the drawing that the shaft on which the driven pinions are mounted also carries the differential gear, the shaft being designed to transmit the power by chains to the rear road wheels of the car to which the gear is fitted.

A REPORT from Washington, U.S.A., states that the number of applications that are being received for patents on devices for automobiles is so great that it has been found necessary to have five special examiners on this work. Four separate divisions have been organized, to which are referred patent papers relating to the different power systems respectively.

MR. HARRINGTON MOORE, the Hon. Secretary of the Automobile Club, in providing for members the excellent *garage* or motor store-house, which we recently inspected at Westminster, has certainly conferred a long-desired boon on automobilists. Conveniently situated, with an excellent approach, the *garage* provides suitable storage space, with competent staff of cleaners, adequate provision for light repairs, and a stock of the thousand-and-one little things an automobilist requires, petrol, and lubricating oils. It has a register of drivers, undertakes the finding of buyers for the cars of Club members, and is open for the reception of members' cars week-days and Sundays, at any hour of the night or day. Mr. Moore's enterprise certainly merits success, for everything which tends to make automobilism easier—and this question of storage has certainly been a serious difficulty—must necessarily foster and augment the progress of the automobile movement.

THE CREESE MOTOR - STARTING DEVICE AND IGNITION GEAR.

IN our report of the recent Exhibition we briefly referred to the ingenious motor-starting device which has been introduced by the Creese Motor-Starter Company, Limited, of Blenheim Grove, Rye Lane, Peckham, S.E., and which can be fitted to any petroleum-spirit motor having two or more cylinders. With engines of this class, as hitherto constructed, the driver or attendant has not been able to easily ascertain which of the cylinders containing explosive mixture should be fired in order to start the engine, and it has been hitherto necessary to leave his seat, and turn a handle to start the engine, which oftentimes is performed at considerable inconvenience. To avoid these, amongst other objections, it has been usual, when it is required to stop the engine for a short time, to throw the driving mechanism out of gear and allow the motor to continue working, so that the restarting of the vehicle is effected by throwing the driving mechanism into gear again. Naturally, when this is done there is a considerable waste of petroleum-spirit, and also wear and tear on the engine. The Creese Company overcome these difficulties by providing an indicator operated by an eccentric, so that the driver or attendant can at a glance discover in which of the cylinders a working charge may be ignited in order to start the engine, and drive the vehicle in the proper direction. This indicator is numbered, for instance, 1 or 2, which corresponds with a contact device such as a push, which is numbered likewise. As an example, if the indicator points, on the engine stopping, to No. 1, all that is required is to push No. 1 button; the charge in the working cylinder is instantly exploded and the engine started.

In cases where the engine has been at a standstill for a considerable time, and the cylinders contain no mixture fit to be exploded, a pump can be provided, and connected with the carburettor by valve-controlled pipes for the purpose of enabling the working charge in any one of the cylinders to be recuperated, so that the working charge is rendered capable of being fired when the driver or attendant operates the ignition device belonging to such cylinder. This pump can be operated by hand or foot. Amongst the principal advantages claimed for the device are, (1) no necessity to descend from car in order to turn handle to start engine; (2) engine not working when car is at a standstill; (3) in descending hills or meeting with restive horses, the engine can be stopped by switching off the current, thus allowing the car to run almost noiseless.

In connection with the device an improved form of ignition gear is adopted. With devices of this class as hitherto constructed the surfaces of contact have been liable to become corroded or soiled and rendered ineffective on account of dust, oil, or the like, getting between them, and preventing good electrical contact being made at the proper time. In the new device the Creese Company claim to have overcome these drawbacks. Two movable pieces or rods forming part of an electric circuit and adapted to move or slide in a dust-proof casing, in

opposition to the action of gravity or a spring, are employed. The movable pieces or rods normally remain out of contact with each other, but at suitable intervals are caused to come into contact and complete the electric circuit of the ignition device, by a cam or other moving part of the engine acting upon one of the movable pieces or rods and pushing it against the other movable piece or rod. The last-mentioned movable piece or rod is provided with a screw and nut, for enabling the position of its contact surface relatively to the contact surface of the other movable piece or rod to be readily adjusted. The contact surfaces are coated with platinum or other suitable material. It is claimed that jolting or moisture has no effect on the new ignition gear and that no cleaning is required.

THE Thornycroft Steam Waggon Company, Ltd., has supplied a couple of their heavy vehicles to the German military authorities.

A THREE-MILES motor-bicycle race and a two-miles motor tricycle race are included in the list of events to be run off at the Sports Ground, Guildford, on Bank Holiday, August 5th.

ONE of the motor-cars plying for hire in Oxford caught fire recently in Cornmarket Street. The driver found that the weather board in the front of the vehicle had become ignited, but with a few buckets of water he quickly extinguished the flames.

MESSRS. S. AND W. CLEAVER, of Howland Mews, Tottenham Court Road, have a well-equipped workshop in which they undertake repairs of all sorts to motor-cars. Painting and decoration also receive the attention of skilled workmen on the premises.

A MEETING of shareholders in the Lincoln Motor-Bus Company, Ltd., was held last week to consider the possibility of re-floating the company on a different basis. It was suggested that a country service to and from the city could be made to pay, and a committee of shareholders was elected for the purpose of considering various

THE CREESE IGNITION GEAR.

ous proposals that were made, and obtaining information on which to work.

THE Irish Automobile Club tour starts on the 8th August next, and so far promises to be a great success. It is necessary, however, that the Secretary of the Irish Club should have the earliest information from parties desiring to join, giving the following particulars:—(1) Number of party, and if mechanic accompanies; (2) class of car; (3) will party start from Dublin, or join in later; (4) do they purpose going over the full itinerary; (5) do they require any arrangements made as to transfer of their cars from England to Ireland and back.

THE other day Messrs. James and Browne, of Hammersmith, showed us samples of a new radiating coil for motor-cars fitted with water-cooled petroleum-spirit motors, they are putting on the market. The coil is made up of 1in. brass tubing with large radiating ribs soldered on; the bends consist of stout pieces of brass, notwithstanding which the weight of the coil comes out at only 11lb. per foot. The coils can be made in any desired shape, to suit different types of cars, and a feature of them is that no wooden separating pieces are employed. We understand that before putting the new coil on the market, the firm have subjected it to extended tests through which it has passed with satisfactory results.

COMMON-ROAD STEAM-CONVEYANCE COMPANY.

ON Wednesday evening the Committee and Shareholders of this Company entertained a numerous party of capitalists, coach-proprietors, innkeepers, and others interested in the preservation of the common roads of the country, at the Albion Tavern, Great Russell Street, Covent Garden; W. Theobald, Esq., in the chair. The dinner and wines were excellent. After the customary loyal toasts had been drunk, the report of the committee was read, from which it appeared that the company had entertained the proposition of steam conveyance on the common turnpike road, in consequence of the highly favourable reports of committees of the House of Commons, in which it was observed—"That steam carriages could ascend hills of considerable inclination with facility and safety—that they were perfectly safe for passengers—that they would become a speedier and cheaper mode of conveyance than carriages drawn by horses—that, with the slightest exertion, they might be stopped and turned under circumstances where horses were totally unmanageable—that they would not act so injuriously on common roads as the feet of horses—that the substitution of inanimate for animal power in draught on common roads is one of the most important improvements in the means of internal communication ever yet introduced; and that its practicability had been fully established." Mr. Mackinnon, the member for Lymington, as chairman of the Committee in 1839, had also observed that he considered the evidence respecting Colonel Maceroni's invention to be most satisfactory and conclusive. He was very glad that evidence had been received, and it would greatly assist the Committee in recommending a means of saving the main roads, and the interest connected with them, from the ruin with which they were threatened. The report then stated that the prejudice which existed against such a mode of conveyance was fast dying away; that the Committee had received the most positive assurances of aid, for the road interests had discovered that it was only by the adoption of the common road steam carriage that their property could be preserved and their traffic maintained; that a patent for Colonel Maceroni's last invention had been obtained; that a carriage and machinery were in the course of construction at the factory of Mr. Beale, at East Greenwich, which would be ready early in the spring, and that the Committee would be able to make such arrangements as would establish the carriage in general use in this country, without calling for the full amount of the capital suggested in the prospectus. The Chairman and Messrs. Gordon, Beale, Hodson, Concanen, Benningfield, Goldney, and other gentlemen addressed the company at considerable length, in which they demonstrated the practicability of steam-conveyance on common roads, and delineated a lamentable picture of distress brought on the previous carriers and other persons who were entirely dependent on the public roads for support, by the privileges granted by Parliament to private companies, which have monopolised the traffic in all direct lines, to the exclusion of all byeway communication. The evidence of the Marquis of Tweeddale, Mr. Mackinnon, M.P., and others, who had travelled in the Maceroni carriage, was quoted, and the meeting appeared quite satisfied that steam-conveyance on turnpike-roads was not only practicable, but that the mode adopted by Colonel Maceroni was the best means whereby it could be brought into general practice.—(From *Bell's Life in London*, February 2nd, 1840.)

THE following letter has been issued by the Automobile Club to all firms engaged in the manufacture or sale of electrical vehicles:—"Mr. Theodore Chambers, of the British and Foreign Electrical Vehicle Company, Limited, has written suggesting that a meeting of makers and sellers of electrical motor-vehicles should be held at the Club to consider the requirements as to the charging of electric vehicles, and such matters as standard voltage, standard plugs, etc. I shall be glad if you will kindly let me have your opinion as to this suggestion, and also let me know if you are willing to attend such a meeting." The following firms have agreed to attend a meeting:—The Electric Motive Power Company, Limited; Shippey Bros., Limited; Electric Power Storage Company, Limited; Mr. E. W. Hart.

HERE AND THERE.

THE Bliss Chainless Automobile Company, of North Attleboro, Mass., U.S.A., are making a steam car with spur gearing in place of chain transmission.

IN Hartford, U.S.A., the police have abandoned the frog's-march and stretcher as a means of transport for such as will not or cannot walk. A handsome electric motor-car with two uniformed attendants has replaced the time-honoured if less dignified methods. Fears are expressed that the temptation to ride free under such pleasant conditions may lead to an epidemic of minor offences.

A LETTER from the Lord Justice Clerk of Scotland, which appeared in a recent issue of the *Motor-Car Journal* on the nomenclature question, was considered at a meeting of the Standing Committee of the Automobile Club, and it was recommended that the Scotch Automobile Club should be asked to consider the question of nomenclature, and to submit their recommendations to the Club Committee.

THE Locomobile steam car, in its latest form, comprises a number of improvements, which are sure to be appreciated by those motorists whose fancy lies in the direction of steamers. A water tank of larger capacity than formerly is now being fitted, thus enabling a longer distance to be run before it is necessary to fill up with water. But, perhaps, the most important improvement is the fitting of a feed water heater and a petrol shut-off valve. By the use of the former not only is the "steaming" capacity of the boiler greatly increased, but an economy in fuel is effected. As for the petrol shut-off valve, this is located near the seat, enabling the driver, at all times, to control the "fire." Other alterations include an enclosed differential gear, spring coil piping, and an extra large cylinder oil cup. We hope shortly to make a trial run on one of the latest type of Locomobiles.

AT a recent meeting of the Standing Committee of the Automobile Club, the Secretary reported that he had been informed privately of the name of the motor-car owner, in consequence of whose behaviour the Duke of Portland had refused to allow motor-cars to run through his Welbeck Estate. It was recommended to the Club Committee that the Duke of Portland should be asked to permit members of the Automobile Club and of its affiliated clubs to drive through Welbeck on condition that they first obtain from the secretaries of their respective clubs a special ticket bearing the name of the member to whom permission is given. The ticket to be available for one occasion only, and to be given up to the lodge-keeper.

A NEW pneumatic tire for motor-cars and other vehicles has been devised by Mr. S. Willington which is claimed to effect an immense saving in wear and tear of the wheels and other parts of the vehicle. The new tire contains no inner tube. The air chamber is rectangular in shape, and is lined and strengthened with canvas. The rim of the wheel is of channel-shaped iron or steel, the sides of which support the rectangular walls of the tire. No complicated means of attachment are required, the inflation alone causing it to become rigidly fixed to the wheel. The tire is said to be capable of resisting enormous pressure without distortion; and, after practical tests, it has proved to be absolutely puncture-proof. The tire is moulded under high pressure; the tread or running surface is not built up in sections but is solid, and its hardness under high pressure gradually increased towards the surface. A puncture-proof band over the air chamber serves to prevent undue dilation of the outer circumference or tread of the tire. The tire is so constructed that if deflated a car can be driven home without injury thereto. There has also been introduced a new, simple, and ingenious improvement for preventing the tire from creeping, which will be known as the "Anchor Bolt." The latter can be applied to solid as well as to pneumatic tires. A syndicate is now being formed with a capital of £3,000 and with the title the Carriage Pneumatic Tire Syndicate, for the purpose of developing and placing the new tire upon the market.

WE understand that orders have been placed for a motor-car service between Colombo to Mount Lavinia, Ceylon.

TO-DAY (Saturday) the Automobile Club of Ireland will hold a run from Dublin to Blessington and back.

MR. W. LONG, the President of the Local Government Board, has made an expedition to Marlow and back on a motor-car.

LORD INGESTRE, the only son of the Earl of Shrewsbury and Talbot, has just purchased a Darracq *tonneau* from the British Automobile Commercial Syndicate.

THE West Croydon Engineering Company, of St. Michael's Road, West Croydon, undertake all kinds of repairs to motor-cars, and supply petrol, oils, greases, etc.

ON Sunday last the police about Paris had a busy time of it. Thirty-three motorists were arrested for furious driving, nineteen of the captures taking place at Saint-Cloud.

THE King of the Belgians has had fitted to the sides of his *tonneau* receptacles containing a complete luncheon service, so that whilst on his tours he can take his meals on board.

THE Shirebrook Colliery Company recently took advantage of the general holiday resulting from the Miners' Demonstration at Chesterfield to give their officials a motor-car trip to Matlock and Bakewell.

ONE of the cars belonging to the Bexhill Motor-Car Company recently conveyed sixteen employees of a local firm to Canterbury (where a stop of four hours was made), and back to Bexhill the same day. Though the roads were in bad condition owing to heavy rain the excursion was most successfully accomplished.

AT the last meeting of the Standing Committee of the Automobile Club, a letter on the subject of motor horns and bells, which appeared in a recent issue of the *Motor-Car Journal*, was submitted, and it was agreed that nothing could be done in the matter until the law affecting motor-vehicles was revised.

WE regret to have to announce the death of Mr. J. McDonald, manager of the Cycle and Motor Company's depot in Dublin, which occurred on Saturday last after a painful illness. Seeing a promising future before automobilism, he took up the matter in a thorough way, and very quickly established a sound business in the motor trade in Ireland.

MR. COURSE and a party of friends met with an alarming experience whilst descending a hill near Rushden in a motor-car the other day. The chain broke, the car swerved and ran into a ditch four feet deep, throwing its occupants on top of a hedge, where they escaped further injury. Unfortunately, with the capsize of the car the oil caught fire and considerably damaged the vehicle.

THE "REX" 6 H.P. GEAR-DRIVEN CAR, MADE BY THE BIRMINGHAM MOTOR MANUFACTURING AND SUPPLY CO., LTD.

A SPEED contest from Eisenach to Meiningen and Zella and back to Eisenach via Oberhof, a distance of about 150 kilometres, is being organised by the Mid-German Automobile Club for the 4th August.

MAJOR DAVIDSON and Capt. John A. Ridgeway, U.S. Military Academy at Highland Park, Ill., and six cadets left Chicago, via Indianapolis, for Washington, on the 20th inst., on two automobile gun carriages.

THE Bristol Motor Company will display four of the latest patterns of motor-cars at the exhibition in connection with the congress of the British Medical Association to be held at Cheltenham from July 29th to August 2nd.

WE learn from Calcutta, India, that a company has just been organised to establish a public motor-car service between Giridih and Hazaribagh, a distance of 87 miles, for the conveyance of passengers and the mails. It is reported that the company has decided to adopt steam vehicles of the Serpollet type.

AUTOMOBILISTS passing through Carlisle on their way to and from the North should note that any repairs needed can be promptly executed by Mr. J. Fendley, at the County Engineering and Motor Works, Cecil Street. Mr. Fendley is official repairer for De Dion-Bouton, Ltd., and the Motor Manufacturing Company, Ltd.

THERE was a big display of motor-cars at Windsor on Saturday last, Mr. Roger Wallace, K.C., the Chairman of the Automobile Club, having invited the members to take tea with him at the White Hart Hotel. About eighty guests availed themselves of Mr. Wallace's hospitality, and a very pleasant time was spent, the run to Windsor and back to town being greatly enjoyed.

AT Stafford Police Court the other day Mr. Peach, the presiding magistrate, asked the clerk what was the maximum speed at which motor-cars were allowed to travel, and whether there was any bye-law which could regulate their speed, of which he heard constant complaints. The clerk replied that there was no such bye-law in Stafford, but by Act of Parliament no vehicles were permitted to travel at a greater speed than twelve miles an hour.

THE proprietor of the Riviera Hotel, Maidenhead Bridge, "on the Bath Road," has offered to the Automobile Club a room for its exclusive use in the hotel, and suggests that probably next year a suite of rooms can be placed at the disposal of the Club. Certain conditions have been suggested by the Standing Committee of the A.C.G.B.I., and if these are agreed to it is probable that the room above referred to will be at the disposal of members in the course of a week or two.

THE "BIG EVENT" OF 1901.

THE Trial Rules Committee of the A.C.G.B.I. met on Monday last. Lieut.-Colonel Holden, R.A., F.R.S., in the chair.

Representations made by makers of vehicles were carefully considered, and the following decisions were arrived at:—

Detours.—The deduction of marks for detours referred to in Rule 31 applies only to the intentional detours referred to in the last paragraph of Rule 30. The final paragraph of Rule 30 to be altered to read:—“Detours made to avoid arriving at a point before time will be accounted as stops. If a detour is accidental, the time lost will not be accounted as part of the running time, and marks will not be deducted.” Rule 31 to be altered to read:—“Any vehicle making a detour must return to the spot at which it left the route.”

Route.—It was agreed that the Hon. Observer should be responsible for pointing out the correct route to the driver of a vehicle.

Private Owners' Section.—Vehicles in Section II. will run under precisely the same restrictions as vehicles in Section I. if the owners desire to compete for an award. The owner by entering a vehicle in Section II. thereby necessarily declares that he is not, or is not about to be, engaged in the manufacture or sale of such vehicles.

Washing Vehicles.—It is hoped that arrangements may be made by which the vehicles may be moved from the Exhibition Gardens at about 8.30 p.m., and that they may be washed under the same roof as that under which they will be stored. In that case arrangements will be made for the washing period to commence at 9 o'clock at night; the period for washing will be extended to one hour, and there will be no limit as to the number of men engaged in washing a vehicle. The adjustment, lubrication, and replenishing of fuel tanks will commence from 6.30 a.m., but not later than 7 a.m.

Spare Outer Covers.—As the vehicles will not travel more than a little over 100 miles on every day, and will return each evening to their starting point, the Committee consider it is unnecessary for the appearance of a vehicle to be disfigured by the hanging to it of an outer cover of a tire. Such a practice leads the public to consider that if they buy a car and take a day's journey on it, it will be necessary for them to have an outer cover attached to the car. But in order to meet the views of competitors, Rule 81 has been altered to read:—“The carrying, during a trial run, of spare outer covers of pneumatic tires so attached to a vehicle as to be within sight of the public is prohibited.”

Hill-climbing Trials.—The formula by which the marks for the hill-climbing trials will be calculated is

$$\frac{\text{Speed} \times \text{number of passengers}}{\text{Price}} \times 1,000$$

The number of passengers will be the minimum number carried at any time during the hill climb. The number of passengers carried must not exceed the number during the other portions of the run.

Delivery Vans and Electric Vehicles.—It was decided to add to the Classification of Section I. :—Class F., Delivery vehicles; Class G., Vehicles propelled by Electricity. A gold and a silver medal are offered in each of these classes, but these will not be awarded unless the Judges' Committee consider the vehicles are worthy of the awards. The delivery vans will be required to carry the load declared by their owners on each of the five days for a run of nine and a half hours, including half an hour compulsory stop for luncheon. The runs will be made out and back on the route for the day. The fuel consumption of delivery vans will be measured. The electrical vehicles will be required to run each of the five days on the route for the day to such point as may be thought good by the driver, and back to the Exhibition on one charge. One mark will be deducted for every minute occupied on the run in excess of the official maximum, i.e., ten miles per hour, and eight miles per hour through controls. The same batteries must be used throughout the five days. If the vehicle fails to run back to the Exhibition, no marks will be given in respect of the day's run.

Ignition Apparatus.—It was decided to include in Section III., Class G., Ignition apparatus.

Entry fee £10, to be paid before noon, on Thursday, August 1st.

FURIOUS DRIVING CASES.

At Highgate, Mr. Ernest Owers, of Hampstead, was charged on a police summons with driving a motor-car in High Road, North Finchley, on the 3rd. inst., at a speed greater than was reasonable or proper, having regard to the traffic on the highway.—Police-constable Overall, 615 S, said that Mr. Owers was driving his car at the rate of twenty miles an hour. A number of cyclists were obliged to stop and dismount, owing to the dust made by the car.—Mr. Owers said he must plead guilty to going more than twelve miles an hour. He was going at the second speed, fourteen miles an hour, and his car was fitted with four powerful brakes, and could be pulled up in its own length. On your own showing you were going very fast.—Mr. Owers: If you would allow me, I should be pleased take you along that road in order to show you there is no danger.—Sir John Glover: I am much obliged. You will be fined 20s. and costs.

At Sittingbourne, Mr. Fred Osborn, of Watford, Herts, was fined £5 and costs for driving a motor-car at an excessive speed at Sittingbourne on June 21st.—The defendant, it was alleged, drove at fourteen or fifteen

miles an hour, causing a horse attached to a dogcart, belonging to a local farmer, to take fright and break the shafts and throw out the occupants.—Mr. Staplee Frith, who defended, said he should apply for a writ of certiorari to quash the conviction, on the ground that the defendant had not been proved to be either the owner or the driver of the car, he, in fact, being seated behind, having no interest in the car, in which he was a passenger only.

At Ryde, Wilfred Morgan was charged with driving a motor-car at an excessive speed, and pleaded guilty. P.C. Taylor said defendant went round the Canoe Lake at a furious rate, and witness timed him as going at twenty miles an hour. Defendant said he was testing the car, which was built to go only eighteen miles an hour. The Mayor said that would be excessive. Fined 1s. and 8s. 6d. costs.

At Epsom, Henry Ward was summoned for having driven a motor-car at a furious pace, in London Road, Cheam, on the 7th inst. P.C. Ashley fixed the speed at which the car was being driven at from fifteen to sixteen miles an hour. When stopped, defendant said he thought he could ride fourteen or fifteen miles an hour outside the radius, and mentioned that the brake refused to act. Corroborative evidence was given by two other constables. Fined £1 with 11s. 6d. costs.

At Chertsey, George Sparks, of Bedfont, was summoned for driving a motor-car in Windsor Street, Chertsey, at a dangerous speed, on July 8th. Defendant pleaded not guilty. P.S. Wright stated that at 12 p.m. mid-day, on the 8th inst., he was on duty in Windsor Street in uniform near the Infants' School. The children were just coming out of school. At the same time he saw a motor-car coming from the direction of the church. There were three persons in the car, which was travelling at from sixteen to twenty miles an hour. As defendant passed, witness called on him to stop, but he took no notice. He went straight ahead, and disappeared up Staines Lane. From inquiries he made the same day he went to Bedfont and found defendant at Stone Villa. In reply to witness' statement, he said he did not see him. William Glover corroborated. Defendant alleged that he was using his hill-climbing gear, which could not drive the car at more than nine miles an hour. Fined 40s.

At Aberdeen the charge against William Hepburn for driving a motor-car at a greater rate of speed than is allowed by the regulations of the Light Locomotives on Highways Act, was called again before Sheriff Robertson. Mr. A. W. Edwards, solicitor for accused, objected at the previous diet to the competency of the complaint, on the ground that the regulations had not been submitted to Parliament, in terms of the section on which the offence was founded. The Sheriff said that was a matter of proof, and accused pleading not guilty, evidence was led. It appeared from the testimony of a police constable and another witness that on the occasion libelled—a recent Sunday evening about seven o'clock—the motor-car passed down Albyn Place at the rate of about thirty miles an hour. So far as he could see, there was nothing in the section to indicate that the regulations were not to be enforced until they had been laid before the Houses of Parliament. Therefore, he had no hesitation in dismissing the objection to the competency of the complaint upon the double ground that it had not been proved that the regulations had not been laid before Parliament, and that, even supposing they had not been laid before Parliament, he was not bound by that to hold that these regulations were invalid. He found the charge proven, and imposed a fine of 40s., with the option of ten days' imprisonment. At Mr. Edwards' request, his Lordship agreed to state a case.

At Richmond, Ernest de Wilton, of Bayswater, was summoned for driving a motor-tricycle at a greater speed than twelve miles an hour. Evidence was given by P.C. Buckley that the defendant was travelling at about sixteen miles an hour. Defendant said he had a stop watch registering a fifth of a second on his handle bar, and a cyclometer on his front wheel. He was timing his speed so as to do a tenth of a mile in between thirty and thirty-six seconds, in view of his acting as an official observer to some automobile trials in Scotland in which a speed of over ten miles an hour was prohibited. The Bench dismissed the case.

At Steyning Samuel A. Smith was summoned for driving a light locomotive at an improper speed. Defendant pleaded guilty. P.C. Bristow stated that on Sunday, June 16th, three-quarters of an hour after noon, he timed the speed at which the defendant was travelling through Southwick on a motor-car. He stopped him, and told him that he had covered a furlong at the rate of over twenty miles an hour. Defendant said he was geared to run at the rate of about thirty miles an hour, that the road was very bumpy, and, therefore, it was impossible for him to go at so high a rate of speed. The average speed at which he could travel was fifteen miles an hour. He was fined £3 16s. 11d., including costs, or in default sentenced to a month's imprisonment.

At Llandudno, D. [M. Kenworthy, of Sale, Cheshire, was fined 25s. and costs for driving his motor-car at a furious pace along the Promenade at Llandudno.

On Wednesday the Worthing magistrates were engaged for several hours in hearing a summons against Mr. Harvey Du Cros, of Birmingham, for driving a motor-car at an unreasonable rate of speed—eighteen miles an hour. When the case came before the court a month ago the six justices who were present were equally divided in opinion, and a rehearing was therefore necessary. On Wednesday there were nine magistrates present. In the course of the evidence given the witnesses variously estimated the speed of the motor-car between fifteen and twenty

miles an hour, and it was shown that the car collided with a brougham, overturning it and throwing the horse to the other side of the street. The evidence for the defence was that the car was going at its lowest rate of speed, from six to eight miles an hour, but the Bench imposed a fine of £5, with £3 1s. 4d. costs. It was stated that Mr. du Cros had been twice previously fined for furiously driving.

At Southport, Edward Ditchfield was summoned for furiously driving a motor-car on the 13th inst. P.C. Black stated that at ten minutes past nine on Saturday night, the 13th inst., he saw the defendant driving a motor-car. For a short distance he went at a rate of from fifteen to twenty miles an hour. A watchman named George Richardson corroborated. Defendant pleaded not guilty; he was simply keeping his car moving while waiting for his employer, but he saw another car going quickly along the street, and it was not until nearly twenty minutes after that the officer spoke to him. The Bench considered the case proved, and inflicted a penalty of 10s. and costs.

A NOISELESS MOTOR.

At Wimbledon, Edward Porter, of Wimbledon, was summoned for driving a motor-bicycle and not giving warning of his approach as required by the regulations.—P.C. Richards said that at 9 15 a.m. on the 27th June defendant was driving a motor-bicycle along the Broadway. He never gave any notice of his approach, and eventually ran into and knocked down an old lady. She was not hurt. Defendant, on being spoken to, said he could not ring a bell because he had lost it.—The Chairman: At what pace was he travelling?—P.C. Richards: Not very fast.—The Chairman: These things make a puffing noise.—P. C. Richards: There was a train passing at the time.—The Chairman: 20s. including costs.

MOSSBERG BEARINGS IN COURT.

In the City of London Court, Mossberg Roller Bearings, Limited, Starchley, Birmingham, sued for £20 for roller bearings supplied to a motor-car for the defendant, Mr. B. C. Wooton, Thornton Heath. Mr. Edgar P. Bainbridge, managing-director of the plaintiff company, said that in November, 1899, he arranged with the defendant to supply Mossberg roller bearings for a motor-car for £20. They were to be fitted in a satisfactory manner to the defendant's Daimler motor-car. The original bearings were supplied by the Daimler Company, but they used soft steel, and it was found necessary to substitute hard steel. That was not found out until the car had been run. The Daimler shafts were too short, and it was found that new axles had to be made. That was done by the plaintiffs, who had made a satisfactory job of it. At the last the defendant relieved them of the responsibility of fitting the roller bearings by getting some one else to do it, and he was now asking the plaintiffs to be made liable for £24 for that. Mr. F. Abrahams, defendant's counsel, said they had raised a counterclaim for £24, because that was the sum which defendant had had to spend in doing the work which the plaintiffs were now suing him for. The defendant said he was particularly anxious to have the work done well, as he used the car for business purposes. Bargate, who had been the plaintiffs' London manager, told him to get the bearings fitted, and he said that the plaintiffs would pay the expense. At that time it was not thought that the sum would exceed £20. The car was still fitted with the plaintiffs' bearings, but they did not run altogether satisfactorily. Mr. Hurst, of Messrs. Hurst and Co., engineers, Croydon, said they were employed by the defendant to put the car in order. He found that the main axles had been turned down in diameter in the lathe. They were reduced in diameter and strength, and the axles were three-sixteenths of an inch out of line. They had to be refitted, and he had the work in hand from May until September. He had fitted the car up again, but there were four tracks instead of two now. His account of £24 had been paid. The Deputy Judge said that, having regard to all the circumstances, he thought that the plaintiffs had only completed their job after what Messrs. Hurst had done. The plaintiffs must be taken to have performed their contract, and they would have judgment for the sum claimed, £20. He also thought that the defendant had proved his counterclaim, but he could not have more than £20. The result would be that there would be no costs on either side, and neither party would get anything. Both would be out of pocket by the transaction.

FATAL ACCIDENT.

At the adjourned inquest, held at Halesmere, on the body of Thos. Nash, the victim of the recent motor-car accident, Mr. Hulford and Rev. G. H. Purdue affirmed that the car was going at the rate of twenty-five miles an hour, and Mr. Barnes stated that the driver was frequently cautioned as to his speed. The Coroner asked the jury to say whether death was due to an accident or to the criminal negligence of the driver. The jury returned a verdict of "Accidental death," but the driver was severely censured for the careless manner in which he drove the car.

BRITISH MOTOR TRACTION COMPANY v. LONGUEMARE.

In the Chancery Division of the High Court of Justice, on Friday, 19th inst., before Mr. Justice Kekewich, Mr. Bucknill said that he had a motion in this matter on behalf of the plaintiffs for an interlocutory injunction to restrain the defendant from infringing a patent belonging to the plaintiff company, but he suggested that it might be desirable to allow the motion to stand until the action of the British Motor Traction Company v. Friswell, which raised the same question, had been disposed of by Mr. Justice Farwell. Eventually the course suggested by counsel was agreed to. Mr. Justice Kekewich said he thought it was the proper thing to do, but defendant must undertake to keep an account of machines manufactured or sold in infringement of the plaintiffs' patent. Simply on that undertaking there would be no order on the motion except that the costs be costs of the action. If the defendant does not shake the validity of the plaintiffs' patent in the other action before Mr. Justice Farwell, he will have to submit to judgment in this action.

AMONG the novelties at the recent track race meeting at Brooklyn, Mass., was the 18 h.p. American-built petrol carriage entered by J. T. Robinson, jun., of the Robinson Motor-Vehicle Company, of Hyde Park, Mass. This machine is said to be virtually a copy of the Napier car. It has a sheet metal bonnet at the front which covers the four-cylinder vertical motor. The engine has 4in. by 6in. cylinders, with a separate vaporiser for each cylinder. A pump driven by the motor injects petrol from the tank into a cup on the dashboard, the excess running back to the tank through an overflow pipe inside the cup. By this arrangement a positive form of constant level feed is maintained without the troubles usually accompanying the use of a float. The transmission gear is adapted to give two speeds forward and a reverse, and is operated by two hand levers projecting through the footboard near the centre of the seat. The water circulation is maintained by a rotary pump driven by a chain from the motor, the water being cooled by passing through flanged radiating coils placed below the body in front. The vehicle has a frame of channel iron and wood wheels with heavy parallel bearing hubs. It weighs about 2,400 pounds.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, AUGUST 3, 1901.

[No. 126]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE King paid a brief visit to Windsor on Saturday last, travelling by motor-car from town, despite the wretched weather. His Majesty arrived at the Castle shortly after two o'clock, and after luncheon inspected the alterations proceeding at the Castle. Late in the afternoon the King again requisitioned his motor-car, and proceeded by road to Downe Place, Lord Alington's beautiful riverside seat, where he was the guest for the week-end. His Majesty, attended by Captain Holford, reached Marlborough House shortly before one o'clock on Monday afternoon, having travelled up by motor-car from Downe Place, Berkshire, upon the termination of his week-end visit to Lord and Lady Alington. It may be added that the Queen also recently took a fifty-mile ride round of the commons and lanes of Surrey upon her motor-car. The run was quite unostentatious, Her Majesty being accompanied by one lady and the driver of the car only.

The Maybach Patent.

AFTER much heralding in the press and much discussion in the automobile world the validity of the Maybach patent has been the subject of a lengthy trial in a court of law. On Monday Mr. Justice Farwell gave a decision which made it plain that there was no infringement in any way whatever on the part of the defendants. This will be apparent to all who read the full judgment which we reproduce on another page of the present issue. Under the circumstances, and in view of the clear statement of Mr. Justice Farwell, it is hardly likely that the plaintiffs will be so ill-advised as to appeal against the decision. Already the dispute has had a bad effect upon business, the pretensions of the plaintiffs having probably deterred many would-be purchasers of motor-cars. They should now be content to go on their way quietly working for the general welfare of the industry as well as their own particular success. The officials and members of the Protection Association are to be congratulated on the results of their action.

The Scottish Automobile Club.

THE Eastern section of the Scottish Automobile Club had a run on Friday, the 26th ult. The cars met in Charlotte Square, Edinburgh, and the members had a most enjoyable trip to Haddington, the roads being in first-rate order, with no dust. Lunch was served in the George Hotel, Haddington, after which the run was resumed to Dunbar, the intention being to witness the sports of the Lothian and Berwickshire Imperial Yeomanry. Unfortunately, however, when the course was reached the weather changed, heavy rain coming on, causing most of the members to decide to return. Amongst those present were Professor Dawson Turner on his Delahaye car, Mr. John Wilson on his Napier car, Mr. John Love on a M.M.C. phaeton, Mr. John Macdonald with the new Kingsburgh car, Mr. Sleight

on a Daimler wagonette, and Mr. T. R. Outhwaite on his Daimler car. At Hadlington, Dr. Ronaldson, on his new Delahaye car, which recently arrived from Paris, joined the party.

Motor-Car Regulations in Lancashire.

THE report of the Lancashire Main Roads and Bridges Committee, issued last week, contains an important reference to the regulation of motor-car traffic and speed in the County Palatine. The Committee have had under consideration the memorial from manufacturers and sellers of motor-vehicles with reference to the carrying of a distinctive number, and as to the limit of speed being reduced to ten miles an hour, as the outcome of which they recommend:—(1) That the general law of the land for all vehicles as extended by the special regulations issued requiring the drivers of motor-cars to stop on the request of any police-constable or of any person having charge of a restive horse, if scrupulously observed and rigorously enforced is at present sufficient to secure the public safety, provided, that every driver should be required to obtain and carry a licence of competency to drive a motor-car, and that each motor-car have affixed to it some identifying number. (2) That, in order to avoid the risk of accidents, it is very desirable that caution boards should be fixed at dangerous junctions or other places on the roads requiring the drivers of motor-cars to drive slowly and with caution.

In the Peak District.

THE lovely scenery of the Peak district of Derbyshire is only known in the mass to the great body of tourists. It requires a pair of sturdy legs to see its many delightful beauties. For ages past the horse has also been called to the assistance of man, and the modern driver of a licensed vehicle is a very conservative individual. One of our contributors has been spending a few days in and about Buxton, Castleton, Matlock, and other centres of the Peak country. Without exception all the licensed drivers, who regard twenty miles a day as a splendid record for a one-horse landau, seem to have an ill-disguised contempt for the motor-car. True, they have seen a few; but the hills of the district are thought to be natural obstacles to their progress. Motorists wishing to test the hill-climbing capacities of their vehicles, and also anxious to further the education of the public, should spend a week or two in the Buxton neighbourhood. We commend the idea for the week-end trips of northern motorists.

Motor-Cars in India.

UNIVERSAL interest was felt in the recent Continental motor-car race and some of the newspapers of India seem to have become quite excited over the event. The *Bombay Gazette* regretfully acknowledges that the adoption of motor-cars is likely to be a long process in the Dependency. Even the use of bicycles was very slowly adopted and is not yet general in the postal and telegraph service. But it is also pointed out by our contemporary that the Indian high road is not a crowded thoroughfare, and there is ample opportunity for the use of the newer form of vehicle. As soon as our makers have secured a large home market they will find profitable employment in meeting the demands of distant places.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

A Converted Clergyman.

NOT only the wealthy are taking to automobilism, but those of less extended pockets are also regarding what has been called the new locomotion with favour. There is a clergyman in a rural district who, from an advertisement, we learn, "would be glad to hear of a serviceable motor-car, to be given away or sold cheaply, by an owner giving it up in favour of a new one." This is a very tempting offer to any owner of a car anxious to dispose of a troublesome vehicle and to assist the ministrations of a poor parson. Some folks use public libraries as receptacles for the worthless books they have done with. This advertisement of the poor clergyman suggests an abiding place for worn-out cars.

Accidents in France.

ACCORDING to the *Velo*, 661 accidents were caused by horses during the month of May in France. Of these 58 were fatal, 603 resulting in injuries only. Railways were responsible for 101 accidents, 14 of which resulted in death and 87 in injuries. The cycle claimed 111 victims, of whom 9 were killed and 102 injured. Automobiles accounted for 5 deaths and

59 injuries, a total of 64. Of the total fatalities the horse was responsible for 67.44 per cent., the railway 16.28, the cycle 10.71, and the automobile 5.81. Of injuries 70.91 per cent. were due to horses, 10.20 to railways, 11.98 to cycles, and 6.91 to automobiles.

Strangling an Industry.

THE folly of timid and reactionary legislation is well brought out by the alleged reasons for delay in adopting automobile transit for His Majesty's mails, namely, that competition with horse-drawn coaches is incompatible with a strict observance of the law. We can well believe this, having followed the midnight mail from Leatherhead to Guildford on one occasion, with a somewhat lame car, which, at a speed not below the legal limit, had little difficulty in keeping behind the well-horsed and furiously-driven coach, whose half-dozen big lamps provided cheerful company on what would otherwise have been a rather tedious and solitary drive. But this same coach has been, as may be remembered, prolific in providing accident paragraphs for the local papers, three having occurred within as many weeks at one time, a year or so back, and the fact of the public being deprived of the increased safety and celerity, and the Department of the economy that would attend motor transport, by the action of an admittedly provisional and experimental law, *donne furieusement a penser*.

Motor-Cars to the Rescue.

DURING the recent heat wave in New York the numerous cases of heat prostration proved too much for the horse-drawn ambulance service of the various hospitals, and outside assistance had to be called in. The *New York World* placed a number of its delivery motor-cars at the disposition of the Hudson Street Hospital. These vehicles were fitted up in regular hospital ambulance style, with stretcher, and one of them is reported to have brought in thirty-five patients in a single day. The vehicles were operated by the regular drivers, who were accompanied by officials from the hospital. The Roosevelt Hospital on July 2nd called on the Locomobile Company for assistance, and the company sent a four-seated vehicle which brought in thirty-seven patients that day, being kept busy until eleven o'clock at night. The next day two cars were furnished, which are said to have done practically the entire work of the hospital, as the horses were completely exhausted by the heat. The unreliability of the horse when most wanted—in hot weather—is one of the strongest and most humane arguments in favour of motor traction. Hundreds of horses were overpowered by heat daily in New York during the period referred to.

A Beginning.

THE London County Council have adopted a recommendation of the Fire Brigade Committee with regard to the expenditure of £400 on the construction of a motor fire-engine, the parts of which are to be purchased and assembled in the brigade workshops. They are to be congratulated on a serious, if somewhat tardy attempt to avail themselves of the advantages of mechanical propulsion, but further details of the course they have proposed will be looked for with interest. The automobile fire-engine is hardly a machine to be put together from purchased parts like a bicycle, and if a thoroughly satisfactory one has not yet appeared—and some, nevertheless, have proved reasonably efficient and satisfactory—the construction of one for the sum proposed will be a remarkably successful achievement. The proposal, however, must be cordially welcomed as a sign of progress, which, if followed up under the auspices of experts in automobilism as well as in fire-brigade work should have excellent results.

Municipal Motor-Cars.

AT a meeting of the Electricity Committee of the Manchester Corporation last week, it was resolved to purchase two steam motor-cars for the use of outdoor officials in visiting sub-stations and otherwise performing their duties. Last year £200 was expended on cab fares for the performance of these duties, and in the previous year there was an expenditure of £300 under the same head. It is believed that the substitution of motor-cars owned by the Department will effect a considerable saving as compared with these figures.

Motor-Cars and Election Addresses.

AGITATION among the District and County Councils against motor-cars, and attempted disturbance in Parliament, has led to the subject of automobilism appearing in the addresses of candidates to such bodies. On many occasions candidates have motored to victory at the polls, and Mr. Henry Morgan, a member of the Willesden District Council, who contested an election for the Middlesex County Council last week, mentioned in his address that "any question arising at the council in reference to motor-cars and their regulations will be carefully watched by me, to ensure that this necessary means of locomotion is not strangled by repressive restrictions." This bold declaration is all the more noteworthy as Mr. Morgan is not the owner of a motor-car; but he evidently recognises the advantages of automobiles lessening the wear and tear of the roads as compared with horse-drawn traffic. The reference to the matter may also be regarded as a tribute to the motorists in

Willesden, a district where their number is certainly growing. We shall be pleased to hear of similar references in the addresses of other candidates for local honours.

**Fine Passengers
as Well as
Drivers.**

AN American magistrate had made a suggestion which would form the groundwork for some useful innovations by some of our bucolic councillors. Not only has he been dealing out heavy fines to the actual drivers of automobiles, but he has urged the police to arrest all passengers in vehicles that they consider are going along too rapidly for legal comprehension. Now, if some of our County Councils—perhaps that of Berkshire might initiate the plan—would consider this aspect of the matter, they might find a better source of revenue than would be found in numbering cars. Especially would this be the case if heavy fines were imposed. We would suggest that the fines might be ear-marked for some special purpose, say the county asylums to begin with.

**Only One Exhibition
Wanted.**

VERY assiduous are some of our contemporaries connected with cycling in their efforts to discourage those motor-car firms which have hitherto shown at the Automobile Club's Exhibition at the Agricultural Hall. During recent years the decadence of the cycle shows has been so marked that the promoters have been very anxious to secure automobiles to attract the general public. We have seen it stated that the

relation to each other. Experts are needed in various capacities. Many of them can find profitable employment as *mecaniciens* of the private carriages of the wealthy or of the delivery vans that are beginning to multiply in our larger cities. In addition to these opportunities trained men are wanted to fill more responsible positions in repairing establishments and *garages*. In providing material for this demand manufacturers will plainly be consulting their own interests. They should have continually under instruction a number of recruits who, on the completion of their course, will be qualified to safeguard their reputation and enable them to render to the owner of the car that full satisfaction which can only come from a good vehicle well operated and well cared for.

**Another Long Run
of an Electrical
Vehicle.**

JUST as we go to press we learn that one of the new types of electric vehicles being introduced by Electric Propulsion, Limited, has had a remarkable run, which was undertaken by experts, in order to prove the actual merits of the Still system for long-distance runs. On Monday last one of these new types of sporting dog-carts started on a trial trip from Messrs. Morgan and Co.'s carriage-building depot in Long Acre, W.C., *en route* to Bath; the roads being shockingly bad after the recent heavy rains, and also having very steep grades to contend with, the car did not reach Bath as intended, but succeeded in reaching Calne (Wilts), a distance of over 90 miles from the London depot, on one charge of the battery. Considering that this

THE AUTOMOBILE TOUR OF HOLLAND.

[Cliche de]

[La France Automobile.]

position of affairs in the motor-car trade is similar to what it was in the cycle industry when the National Show came into existence. There is no foundation for such an assertion, for the whole of the automobile trade is unanimous in declaring its view in favour of only one exhibition—and that the exhibition which is held under the auspices of the recognised authority in this country, viz., the Automobile Club. All attempts on the part of our friends on the cycle press to create a sectional feeling in the matter are likely to end in failure, and the sooner they desist from the present policy the better will it be for their credit as prophets and common-sense business men.

**Trained
Mechanicians
Wanted.**

ONE of the most obvious duties devolving upon motor-car builders is the training of men competent to operate and repair the cars they turn out. The success of an automobile in actual service depends in a large measure upon the manner in which it is operated and cared for. This presupposes a familiarity with the individual vehicle which can only be acquired under the supervision of an experienced foreman, for it involves a knowledge of the different parts of the car and their

vehicle complete, together with two passengers, only weighed 31½ cwt., it is a record which the company may well be proud of. Mr. Basil Joy acted as observer. We understand the company will shortly build another type of vehicle estimated to run from 140 to 150 miles on one charge of the battery, and when finished other makers of electric vehicles are to be invited to join in a friendly run of 120 to 150 miles on one charge of the accumulators. We are promised further particulars of the "Still" carriage motor and the "Ideal" storage battery, which combination is apparently well fitted to carry out long-distance runs by the aid of self-propelled electric vehicles for both pleasure and business purposes.

**The Motor-Car in
Commerce.**

THE latest firm to enlist the services of the motor-car is Messrs. Cadbury, of cocoa fame, they having obtained a serviceable car to facilitate the distribution of their goods. The holding capacity of the car is very large, and by utilising it Messrs. Cadbury are able to get goods delivered at places within comparatively short radius from Birmingham which they found it difficult to reach prior to the advent of the car. For instance, in forwarding goods to West Bromwich and other

places in the Black country by rail the boxes had to be sent by the Midland line, and then a change over had to be made at Birmingham and the remainder of the journey made over the Great Western line. This naturally involved delay and it sometimes happened that goods sent out on Monday did not get delivered until Wednesday. Now the motor-car is loaded up and in a few hours the Black country is reached and deliveries are being effected. In the very hot weather, when the chocolate or cocoa stands a chance of being adversely affected, in appearance at any rate, this quick delivery is invaluable. The firm speak very highly of their car, and, so far, are more than satisfied with its working and the results achieved with its aid.

A Place for Everything.

A FRENCH contemporary devotes some space to the consideration of how best to dispose of tools in a motor-car. Those most frequently in use — wrenches, spanners, screw-drivers, and such like — it is suggested, should be placed in a pocket or small drawer attached to some accessible part which will not necessitate the derangement of passengers when these articles are required. Other tools less frequently employed should be kept together in a covered box under the driver's seat. With these also should be kept such spare parts as are carried, each in a separate wrapper, and labelled. Oil and grease must be placed by themselves, and well away from tools or parts, for their receptacles are prone to leak, whatever may be said to the contrary. The advice is good, but, bearing in mind the various builds of cars, and ways of disposing of their mechanism, it can only be followed with a certain amount of latitude.

County Councils and Motor-cars.

A MEETING of the Shropshire County Council was held at Shrewsbury last week, when it was reported that a communication had been received by the Roads and Bridges Committee from the County Council Association in reference to the speed of motor-cars and the licensing of drivers. The Committee were of opinion that there should be no fixed limit as to speed, but that the drivers should be compelled to obtain certificates as to their capability. Sir T. F. Boughey proposed that there should be a limit of twelve miles an hour, which he considered was quite fast enough for such vehicles, if other traffic was to be carried on with safety. Major Patchett and Major Heber Percy were opposed to the fixing of any limit. Mr. H. H. France-Hayhurst thought the Committee should define what was "a safe speed," and recommended that the report be referred back to the Committee with that object. This was supported by Mr. Chubb, but was eventually withdrawn. Sir T. F. Boughey's amendment was negatived, and the report was adopted.

Not Wanted in Egypt.

EGYPTIAN newspapers are reported to have declared war on the automobile. They urge the Government to take severe and rapid measures against motor-cars in Egypt, citing as a warning the threatened increase in their numbers, which will "surely bring about a fall in the prices of railway stocks." It is asserted that a day may come when all communications will be made by means of the automobile, and then the investments in railway stocks will be lost. It does not seem to have dawned upon the Egyptian mind that these days are not the days of the Pharaohs, nor is the traffic problem of the present to be solved by too close an adherence to the ways of an older day.

A MOTOR-CAR in which the Duke de Morny, a friend, and two engineers were driving at Nevilly (France), ran off the road and plunged into the Seine, owing to the steering gear going wrong. All four occupants jumped out in time to save themselves from falling into the river, and escaped with a few bruises.

THE IRISH AUTOMOBILE TOUR.

DESCRIPTIVE NOTES ON THE ROUTE.

THE official programme of the tour of the Automobile Club in Ireland has now been thoroughly revised, and in its amended form sketches out a most comprehensive trip through the loveliest districts of Ireland. We append a summary of the itinerary:—

(1)	Aug. 8th	Dublin to Waterford, <i>via</i> Carlow	99½ miles.
(2)	" 9th	Waterford to Cork...	81 miles.
(3)	" 10th	Cork to Killarney ...	95½ miles.
(4)	" 11th	Killarney.	
(5)	" 12th	Killarney to Waterville ...	59½ miles.
(6)	" 13th	Waterville to Killarney ...	40 miles.
(7)	" 14th	Killarney to Limerick ...	87½ miles.
(8)	" 15th	Limerick to Kilkee ...	55½ miles.
(9)	" 16th	Kilkee to Galway ...	90 miles.
(10)	" 17th	Galway to Recess ...	47½ miles.
(11)	" 18th	Recess.	
(12)	" 19th	Recess to Kylemore, Cong, and Recess ...	64½ miles.
(13)	" 20th	Recess to Leenane and Ballina ...	67½ miles.
(14)	" 21st	Ballina to Sligo ...	37 miles.
(15)	" 22nd	Sligo to Enniskillen ...	74½ miles.
(16)	" 23rd	Enniskillen to Dublin ...	104½ miles.

THE ROUTE.

(1) Having cleared Dublin a good main road is soon struck, and this continues to be mostly favourable, improving still more through Carlow, where beautiful scenery will be encountered. The surface deteriorates towards Waterford.

(2) From Waterford the route is not good, but as it leads towards a very beautiful district—that of the Irish Rhine—there will be ample compensation for the rather poor quality of the roads. Generally speaking, the roads through co. Waterford are not up to standard, and in Cork they are even worse. The environs of Cork are beautiful. Queenstown should be visited, and a trip to Blarney might benefit some of the tourists.

(3) Beyond Cork, and approaching Kerry *via* Glengariffe, we get into that district of mountain passes and good roads. Keimaneigh is the first notable defile gone through, and it may be taken as a sample of the Kerry passes. They are winding routes of excessive narrowness at parts. Motorists unused to such highways should exercise great caution at first. The experienced driver, however, finds a fascination in negotiating the seemingly endless series of sharp corners. Vistas are presented with cinematographic quickness, and lovely they are beyond compare. Glengariffe is a place to wax enthusiastic about, and undoubtedly is the gem of the whole tour. It is ideally situated in a land-locked bay, where rich vegetation covers the hills down to the water line, lapped by the warm current, which has the geniality of the Gulf Stream to heighten its temperature. A stiff but marvellously interesting run takes the motorist from Glengariffe towards Killarney. After miles of climbing a long descent follows. Nearing Killarney another long and winding descent commanding superb panoramas of the lakes is encountered. Great caution must be taken on this tricky road and a sharp look-out for muddy patches, coaches, tourists, and other dangers. Round many of the sharp corners unexpectedly brusque pitches occur, which should be taken very carefully. The experience of the long downward glide through this sylvan little road is one to be remembered. It gives absolutely the best views of the Killarney lakes.

(4) August 11th will be an off day, and motorists would do well to occupy the time by boating excursions on the lakes.

(5) On the 12th, the trip to Waterville by Kenmare and Derrynane will give further acquaintance with the Kerry passes and many records in the way of magnificent scenery. This day's run will rank as one of the best, for it will take the tourist from the relaxing, languid atmosphere of the inland valley, by quick changes up amongst the hills, and then suddenly out to the iron-bound coast where the great Atlantic hammers unceasingly. Parknasilla is encountered; and it is in effect another Glengariffe mounted on the side of a great fiord. Following the north shore of this inlet we are brought in time to the open sea and treated to many splendid marine views. At

Cahirdaniel a detour down a narrow and very tricky by-road is taken to visit Derrynane, the ancestral home of Dan O'Connell, and also to view one of the loveliest little bays in all Kerry. The day's run finishes by a climb over Coomakista Pass—stiff, but magnificent—and a good run down to Waterville.

(6) Waterville to Killarney has many splendid scenes to repay the trip, but is scarcely the equal of the previous day's run. It winds up gloriously, however, by giving an approach to Killarney from a different point, and showing the mountains thereabout to the utmost advantage.

(7) Through bog-lands the next day's journey leads, past Listowel, and then in sight of the great Shannon estuary at a point where it is several miles wide, and incomparably the grandest river in the United Kingdom. A delightful run by Foynes and Glin leads to Limerick, over a road which deteriorates towards the end.

(8) Limerick to Kilkee is a journey containing some bad roads till County Clare is entered, when they improve. Fine scenery will be encountered at many points.

(9) The next day's trip to Galway will be of a most interesting character, too, affording many glimpses of the wildest parts of the West. At O'Brien's Tower a stop should be made, and the stupendous cliffs of Moher visited. They have no equal in these Isles.

(10) Leaving Galway, a rough road will be encountered as the approach to Connemara is made. But nearing Reccess the surface improves, and the motorist will find himself in quite a level country of good roads. After the corkscrews of Kerry the straight-away stretches of Connemara will no doubt be welcomed by the steering gear. All the party will not put up at Reccess, which is only an hotel and a railway station. Some will be billeted at various points a few miles off, where excellent hotels and charming scenery will make each section of the party positive that it is the luckiest.

(11) The following day will be one of rest, there being no official programme. The time can be availed of to advantage in scores of ways.

(12) The run to Kylemore Castle and thence by Salruck, Leenane, and Cong to Reccess takes the tourist through the very best of the Connemara scenery. Kylemore Castle is a magnificent pile set amongst the most romantic surroundings. The great fiord of Killarney harbour will be another of the remarkable sights seen on this red letter day.

(13) This day's run, though interesting in itself, will suffer by comparison with the previous day's trip both in respect of scenery and road surface.

(14) Some pretty scenery encountered on this day's run. Sligo is a beautifully-situated town, and leads to a charming district around Lough Gill. An afternoon run will probably be taken in that direction.

(15) The latter portion of this day's run contains the best of the scenery. From Belleek to Enniskillen many glorious views will be noted. The trip along the shores of Lough Erne rivals anything that even Kerry has shown. The road is narrow, and nearing Enniskillen is of poor surface.

(16) A long run through medium scenery concludes the tour. Nothing very noteworthy will be seen, though for the most part the road winds through a well wooded rolling country, affording many pretty landscapes.

MESSRS. HUTTON AND CO., of Warminster, are agents for Carless, Capel, and Co.'s petrol, oils, and greases, supplies of which are always in stock.

At the last meeting of the Montgomery Town Council, Alderman Fairles-Humphreys said he had received a letter from Mr. Pryce Trow, of Swansea, offering a motor-car, to carry fourteen persons, for sale. The original price was £700, and he offered it to the Council for £350. Councillor Davies thought the time had come when they should have some better means of communication with the railway station than they had at present, but the Council decided not to entertain the offer.

A NOVEL ELECTRIC RACING VEHICLE.

FOR the track races held by the Automobile Club of New England at Brookline, Mass., recently, the Riker Motor-Vehicle Company produced a special electric racing vehicle, of which a diagram, taken from the *Horseless Age*, is given herewith. The car proved to be the sensation of the day, as its light weight and exceedingly low centre of gravity gave it a great advantage in racing on so short a track and on such flat turns. It consists of two tubular axles connected by a pair of tubular rods on each side. These rods are placed directly over one another about 4 inches apart, the pairs of rods being about 20 inches apart. The lower of these rods are on the same level as the axle, and the whole mechanism of the vehicle is hung between and below the upper rods. As the wheels are 32 inches in diameter, they are the only parts of the vehicle, except the steering handle, that are over 20 inches from the ground. At the front end of the frame is hung the box containing the battery, on top of which the steersman sits. The upper set of tubes are carried

forward and curved so that they meet about three feet in front of the front axle. Tubes drop down from these and form a support for the steersman's feet and for the steering post, which projects upward between his legs and is operated by a bicycle handle bar. Immediately behind the battery box is hung the controller, the handle for operating which is at the top, just behind the steersman's seat. The second man is seated at the rear and operates the controller handle, which is directly in front of him. At the rear of the frame are hung the two encased motors, which carry on the outer end of their motor-shafts spur gear pinions, which drive spur gears secured to the hubs of the rear wheels. The vehicle as illustrated is not entirely completed, as it is intended to place a sheet metal, plough-shaped wind shield on the projecting part of the upper tubes, in order to reduce the wind resistance as much as possible.

THE new Mercedes vehicles of Mr. W. K. Vanderbilt and Mr. Clarence Mackay, two well-known American motorists, have made their appearance at Newport, where they are attracting much attention.

ARRANGEMENTS are in hand for the starting of a service of motor-cars between El Aghnat and Blide, Algeria, for the conveyance of both passengers and goods. The distance between the two places is about 200 miles, and will, it is expected, be covered in two days.

THE prize exhibit at the Hall of Education, New York, of shop work and constructive work in paper from all grades of the public schools of New York was a miniature motor bus run by a dry battery which is perfect in every detail. Arthur Jensen, the designer and builder, is a fifteen-year-old boy, who passed through the various stages of the constructive period from the folding of paper to the drawing of his own designs and their execution in wood. In the fifth year the pupils are urged to do home work, and the boy commenced by solving for himself the fascinating problem of the automobile.

To get miles from anywhere and discover that the water in one's steam carriage is exhausted is excessively disagreeable. The Kitts low water alarm for steam carriages, made by the Kitts Manufacturing Company, of Oswego, N.Y., has been introduced to prevent this happening. This device is so constructed that when the water gets low, the alarm whistle gives a short toot, stops, then toots again. This is done before the danger point is reached, and calls the attention of the operator in ample time to prevent damage to the boiler.

THE BRITISH MEDICAL ASSOCIATION AT CHELTENHAM.

(From our own Correspondent.)

ALL those automobilists who participated in the 1,000 Mile Trial assuredly retain the pleasantest of recollections of Cheltenham, for it is a town that one does not readily forget, if only by reason of its shady avenues and the cleanliness of its streets. To me the Gloucestershire town closely resembles in appearance a French *ville de province*, and one can see there any fine evening in summer the terraces of some of the hotels in the Promenade crowded with diners just as one sees them the other side of the Channel. But if Cheltenham is French in appearance, it is certainly not in customs, for up to the present the horseless carriage has not thrived here. A few—a very few—motor-carriages are in use in the town, and despite the efforts of Messrs. Morgan, Norton, and other enthusiasts the great majority of the residents have no sympathy with the new sport. But the visit of the members of the British Medical Association to the town is now giving Cheltenham resi-

finished example of the company's voiturette, too well known to require description. Mr. E. Instone has also another and larger car within the exhibition grounds which is running almost continuously on trial trips. The Hozier Engineering Company, Limited, show a couple of smartly finished Argyll voiturettes fitted with M.M.C. water-cooled motors. One of these two cars is running about the grounds daily, and creates a very favourable impression. From Mr. Warren Smith I learn that since August 1st the price of these small cars has been augmented on account of the business having been taken over by a large American syndicate. Messrs. H. G. Norton and Co., one of the leading cycle firms of Cheltenham, make a great display of bicycles, and in addition show, and run a neat little New Orleans voiturette. Mr. A. E. Cohen is in charge of the Weston Motors' exhibit, and he is showing three cars, one of which is doing good work in demonstrating to the public the capabilities of a good steam carriage. Certainly this carriage excites as much interest as any in the show and good business is being done. Weston's motors will from now be represented in Cheltenham by Mr. Morgan. Another firm which is busily engaged is the Singer Company, and Mr. Duret is continually besieged with

FIG. 1.—THE YORKSHIRE STEAM MOTOR WAGON. (See opposite page.)

dents an opportunity of seeing a variety of motor-vehicles, for this year an automobile section has been added to the Association's ordinary exhibition, in order to keep medical men *au courant* with the latest developments of the industry. If this new section is not particularly large, it is nevertheless not without interest, either to the doctors or to the residents of Cheltenham, and the introduction of automobiles into the carriage class of the exhibition will assuredly do good to the industry.

The exhibits are, with one exception, shown in a marquee within the grounds of the well-known Winter Garden, and in close proximity to the hall itself. They are capitally arranged, and on the opening evening looked very well, lighted up with Chinese lanterns. Upon entering the marquee one finds directly in front of the entrance a two-seated Panhard-Clément car, exhibited by Stirling's Motor Carriages, Limited, the representative of which company is usually busily engaged in affording trial trips to the crowds anxious to try this smart little car. Directly behind this stand is found that of the Motor Manufacturing Company, Limited, upon which is to be seen a beautifully

requests for demonstrations of both motor-bicycle and tricycle. In addition to these the company also show a tricycle provided with a basketwork seat for a passenger, this machine weighing 160lbs.

Messrs. Wastnag and Co., Limited, 231, Maida Vale, London, W., also show a motor-bicycle, their machine being of the Minerva type. The motor develops $1\frac{1}{2}$ h.p. The list of exhibitors of motor-bicycles is completed with the name of Messrs. Bayliss, Thomas, and Co., Limited, who show the Excelsior, a machine carrying its motor in a similar position to the Minerva. These bicycles are being demonstrated in the show grounds, and apparently run with great regularity, the *mise en marche* being particularly easy. At the Bristol Motor Company's stand one finds Mr. Appleton, ever ready to explain and demonstrate the various cars shown by the company, these including a handsome 9 h.p. Daimler *tonneau*, three De Dion voiturettes, and a Progress phaeton of improved design. The latter is a particularly attractive little car, the carriage work by Messrs. Mulliner being irreproachable.

In addition to the above exhibits, Mr. Morgan, of Clarence Street, Cheltenham, shows a Star car in the main hall; but to really appreciate the position which Mr. Morgan holds in automobilism in the West of England one should visit his garage, in the workshops of which one can generally see a variety of cars under treatment. Fitted with excellent plant, these workshops admit of any class of repair being speedily executed, and, as official repairer to the De Dion and Bouton Syndicate and the Motor Manufacturing Company, Mr. Morgan is well known among local motor men.

THE YORKSHIRE STEAM MOTOR-WAGON.

WE are able this week to publish illustrations and particulars of a new heavy steam motor-wagon which has lately been put on the market by the Yorkshire Steam Motor Company, of Ingham Street, Hunslet Road, Leeds, for loads up to four tons. There are several entirely novel features embodied in the vehicle, which gives it a somewhat different appearance to most of the other makes on the market. The boiler (Fig. 2) is on the locomotive principle, but with two short barrels, and, it will be noticed, is fixed across the front end of the frame. The fire tube connects the firebox with a combustion chamber at each end, and the return tubes carry the gases to another central chamber connected with the chimney. There is no exhaust steam blast pipe in the chimney. The steam, after it leaves the low-pressure cylinder, passes through separators, the water being drained away; the dry steam then enters the two chambers formed in the doors at each end of the boiler, where it is thoroughly superheated, and escapes through a series of small jets into each return tube. The effect of this is, it is claimed, to obtain an absolute silent and invisible exhaust, and an equal distribution of flame or gases over the heating surface. The boiler is a rapid "steamer," and very economical. The wagon can be taken up steep hills of any length with a full load and maintain its pressure and water level with the engine running

Fig. 2.—SECTION OF BOILER.

at its maximum speed, the fuel used being common gas coke. Another special feature is the arrangement of the gearing, the wagon being entirely driven by steel spur gear-wheels. The crank shaft is carried in bearings bolted on each side of the frame; to each of these bearings a strong steel bracket is hinged which carries the second motion shaft and axle bearings (Fig. 3). These brackets are free to swing on the hinges at

one end, the other end sliding on strong guides, and connected to the wagon frame by ordinary laminated springs, so that the vehicle can rise and fall without altering the centres of the shafts. There are only two bearings on each shaft with gearing in between them. The second motion shaft and axle are carried in swivel bearings, so that, no matter how unequally the wagon is loaded or how uneven the road, there is no fear of the shafts binding—in fact, during a trial trip recently with a load consisting of two heavy castings the load shifted to one side so that the spring at that side was compressed to its maximum limit, whilst the other was fully open. Under these adverse conditions a run of several miles was made at fast speed without a single bearing

FIG. 3.—DIAGRAM SHOWING ARRANGEMENT OF REAR SHAFT AND AXLE.

heating. Two speeds corresponding to $5\frac{1}{2}$ and $2\frac{1}{2}$ miles per hour are provided, and an ordinary jack-in-the-box differential gear is arranged on the axle.

The cylinders are fixed on the outside of the frame, the high pressure on one side and the low pressure on the other, making all the motion easily accessible; in fact, an important feature of the vehicle is that all the gearing and steam joints can be got at with the wagon loaded. The crossheads run in cylindrical guides, fitted with dust-proof covers; the cranks and connecting-rods are also protected in dust-proof metal casings. The engine is reversed by an improved single eccentric gear operated by a lever on the driver's platform.

The steering is of an improved Ackerman type, worked by a screw and lever; the front axle carries the wagon on a transverse spring fixed in such a manner that the wheels can pass over obstructions without subjecting the frame to any cross strains. The road wheels are of the gun-carriage type, with steel bosses, oak spokes, and ash felloes, the driving wheels being fitted with drag rods to relieve the strain of driving through the spokes. The frame of the vehicle is built with channel steel sides fixed to cast steel cross girders, and braced with diagonal stays to resist cross strains in travelling on uneven roads. The axles and shafts are of mild steel, while the balanced cranks are of forged mild steel, shrunk and keyed on the end of the shaft.

A powerful screw brake acting direct on the tires of the driving wheels is capable of bringing the loaded vehicle to a stand on the steepest incline. A large tank is fixed at the rear of the wagon and provided with a steam water lifter for filling from any stream or spring. The boiler is fed by a force pump worked direct from the second motion shaft; an injector is also provided for use in case of emergency. The main object of the makers in constructing this wagon has been to use the most suitable materials combined with the best workmanship, and so turn out a vehicle which can be confidently recommended for the hard wear that it will be called upon to stand.

AN agitation is being set on foot for the amalgamation of the Metropolitan and the City police forces, and it has received considerable impetus from the action of the City Police Commissioner in connection with the case of Mr. L. Sinclair, M.P., who was recently summoned for furiously driving his motor-car.

DR. SCHATZEL, a high official of the Bavarian Post Office, has just published a pamphlet on "Motor Postal Cars and their Use." He considers the possible utilisation of motor-cars in the postal service from different points of view, and comes to the conclusion that "the present gap between railway and horse locomotion will be completely filled by motor-cars on the highways."

THE PARIS-BERLIN RACE.

THE FOUR GEORGES RICHARD PETROL CARS WHICH SUCCESSFULLY MADE THE JOURNEY FROM PARIS TO BERLIN IN THE TOURIST SECTION.

CONTINENTAL NOTES.

BY "AUTOMAN."

MILITARY authorities in France are recognising more and more the important *role* which the automobile will play in modern warfare, and the great advantage that will be gained by the army operating in Europe best equipped in this direction. In the French manoeuvres of this year motor-cars will be put to very severe trials, and practically the whole of the staff will be provided with them. It is understood that General Brugère, who would in case of war be the general commanding the troops, will be provided with a Serpollet steam-car whilst directing the operations of this year's manoeuvres.

THE A.C.B. is about to issue route maps of Belgium for the use of automobilists, and the Committee are asking all the members to send in as much useful information as possible, in order that these maps may be very complete and serviceable to motorists.

No decision has yet been come to by the automobile authorities in France as to whether the autodrome is to supply the place of road racing, or whether an attempt is to be made to work on the politicians who have done such an injury to the trade by suppressing road racing. In the light of to-day it seems a great pity that the A.C.F. did not bring forward the weight-limit rule of a year ago, as it would no doubt have had the effect of mitigating the dangers, and might have prevented the accident at Reims.

THE A.C.F. are organising a mile race at Deauville, where they have succeeded in securing for the afternoon of September 1st the splendid promenade along the sea. It is a little over a mile in length and nearly a straight line, there being only one slight bend towards the middle. Deauville is within four hours railway journey of Paris, and close to Trouville. It is proposed that all the competing cars must make the journey from Paris to Deauville on the day before the race in less than ten hours, that is to say, at an average speed of about twelve miles an hour. There will be eight classes, namely—A, motor-bicycles; B, motor-cycles; C, voiturettes; D, light carriages; E, heavy carriages; F, steam carriages; G, electric carriages; H, carriages that were classed within the first five in Paris-Bordeaux and Paris-Berlin. These will include the well-known names of Fournier, Maurice Farman, Voigt, Pinson, Giraud, Louis Renault, Teste, Rivierre, and many others. Three special prizes will be given; one the Deauville cup, one the *Auto Velo's* cup, and one the Alcohol cup. There will not be a flying start, and each car must be started by its occupants without being pushed.

THE hill-climbing trials at Spa produced the following results:—Class 1, motor-bicycles—De Kidder, on a Delin, climbed the hill in 8 min. 55 1-5 sec. Class 2, motor-tricycles—Osmont, on a De Dion-Bouton, 5 min. 21 2-5 sec. Class 3—Orban, on a Cudell, 12 min. 57 3-5 sec. Class 4—Roland, on a Gobron-Brillié, 7 min. 47 1-5 sec. Class 5—Baron Joseph de Crawhez, 7 min. 37 4-5 sec. In the handicap between the winners of the various classes the Baron Joseph de Crawhez came in first, fifty yards before Osmont.

M. SANTOS-DUMONT was out in his navigable balloon again on Tuesday last, taking a trip over the Bois de Boulogne in the presence of a large crowd. The motor, however, which is cooled by air, was not working very well, the cylinders unduly heating. As the working was not to the satisfaction of M. Santos-Dumont he did not attempt a journey round the Eiffel Tower, but confined himself to sailing backwards and forwards over the wood, and then gracefully and lightly descending, bringing his balloon to rest at the spot from which he started.

THE BLAKE SPARKING PLUG.

MR. F. C. BLAKE, of Dalling Road, Hammersmith, has lately introduced an improved sparking plug, of which a sectional illustration is given herewith. Its chief features are the methods employed for fixing the porcelain plug, *e*, in the steel body, *f*, and for holding the central conductor in place inside the porcelain. For the former purpose the porcelain plug, *e*, is conical, and is only glazed over its smaller half. Four circular grooves are cut in it, and these correspond with similar grooves in the body, *f*, into which it closely fits. A special fire-proof cement is used to hold the porcelain in place, and as the cement fills the grooves in each of the two parts, a very firm fixing is obtained. The central conductor passes freely through the centre of the porcelain and is provided with a conical head, *h*, which is ground to fit the porcelain, like a gas-tight valve. Its outer end passes through a washer, *d*, and is held in place by a spiral spring, *c*, which presses against the lower milled nut, *b*. For attaching the necessary conducting wire to the screwed portion, *a*, a second nut, *h*, is used. This arrangement enables

the central rod of the plug to expand and contract without causing any leakage between it and the porcelain. An "earthed" platinum point, *g*, is fitted in the usual way.

A HILL-CLIMBING competition between Schottwein and Semmering is being organised by the Austrian Automobile Club for September 15th next. The trial will be open to voiturettes, light cars, heavy cars, motor cycles, and electric vehicles.

NEW regulations for motor-cars have just been issued in the German Province of Brandenburg. The pace is restricted to nine miles an hour in the suburbs, and this pace is never to be exceeded after dark in the country. No racing will be allowed on public roads without special permission of the police.

ON Saturday last Mr. John Stirling, of Stirling's Motor Carriages, Limited, of Hamilton and Glasgow, completed a run from John o' Groat's to Land's End. The car used was a Stirling Parisian phaeton, and the net running time worked out at 59½ hours. The amount of petrol consumed on the journey of 900 miles was 28 gallons.

THE German military authorities are making some interesting experiments in the neighbourhood of Berlin with heavy motor-cars. One car in particular shows itself well adapted for field purposes. It attains a speed of five miles an hour when laden with five tons, and nine miles when empty. A considerable number of cars have also been acquired by the authorities for use in the forthcoming Army manoeuvres. One of the vehicles approved of is designed to carry two machine guns, and another is for the accommodation of staff officers.

THE Rev. H. H. Jevons, of Wolverhampton, while on a motor-car tour recently, had a narrow escape. Whilst descending a steep hill at Standish, some four or five miles from Gloucester, the car got beyond his control. In front were several brakes with excursionists from Chalford, and between the motor-car and the brakes a bicycle ridden by Mr. W. H. R. Ford, of Stroud. The motor-car crashed into the bicycle, sending Mr. Ford flying some yards into the ditch. Fortunately, neither Mr. Ford nor the rev. gentleman were any the worse for the adventure, though the bicycle was badly damaged, the car having to be lifted bodily off it.

THE SCLAVERAND COMPRESSED-AIR LIFTING-JACK.

AMONG the many useful devices made by M. Sclaverand, of Paris, and introduced into this country by Mr. A. A. Godin, of 10, Gray's Inn Place, W.C., is a compressed-air lifting-jack, of which an illustration is given herewith. The jack is a neat and compact little article in the form of a double cylinder, one sliding inside the other, with a projection to hold the axle of the wheel. At the foot of the jack is

a two-way tap and a non-return valve, to which an ordinary tire inflator can be attached, and by forcing air into the cylinder the heaviest car can be raised in a few seconds. The jack is made in several sizes, intended to lift cars weighing from one to five tons. As mentioned above, any motor-tire inflator may be used with the jack, but the firm recommend a special one of their own construction to which a pressure-gauge is attached.

THE *Candid Friend*, in its last issue, publishes an interview with Mr. Frank Gardner, of the Gardner-Serpollet Company, in the course of which it is stated that M. Serpollet is now engaged on the construction of a motor-car of 1,000 h.p. We hardly think this correct.

THE Automobile Club Dauphinois has, with the sanction of local authorities, arranged a hill-climbing contest at Laffrey, near Vizille, on the road to La Mure, for the 11th inst. The course measures 6,500 metres (about four miles), with an average gradient of 9.3 per cent.

THE Cycling and Athletic Sports at Wisbech, last week, were the occasion of a good turn-out of motor-cars. In spite of the rain, which fell heavily during the day, sixteen cars put in an appearance, and though there was no event open to them, gave a display of speed and control on the track.

THE Continental Caoutchouc and Guttapercha Co. are manufacturing two kinds of motor tire repair outfits. The small outfit, which is 4 inches by 3 inches by 1 inch, contains a parcel of patches, solution, two rolls of rubber, canvas, and sandpaper. The large outfit, suitable for heavy motor-car tires, is 12 inches long, 2½ wide, and 2¾ deep. It contains, besides the small outfit which we have just described, the following articles:—Two rolls of proofed canvas, eight strong moulded patches, sandpaper, nickel-plated tire lever, one roll of patching sheet, and other essentials.

CORRESPONDENCE.

THE DE DION VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would any of your readers kindly inform me if it is a usual occurrence for the De Dion gears on a 3½ h.p. voiturette to keep up a singing noise while travelling? If it is a natural noise, are there any means to allay the same, as it is very disagreeable to outsiders?—Yours truly,

A. D. JACKSON.

THE DANGERS OF STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As I intend shortly to purchase a steam car, I should be glad if some of your readers would kindly give their experiences as to their danger, for having been told by users of the ordinary petrol-car that they need very great care in order to avert a flare up, I am naturally somewhat anxious as to what may be my fate, should I go in for one, as I should manage it entirely myself.

Might I also ask any who have fitted a back-seat to their cars, to say if it answers satisfactorily? It is a great drawback to these vehicles that the smaller pattern will only seat two, and I understand that next year's pattern will provide three seats, the four-seated car not having proved a success.—Yours faithfully,

A BUSINESS MAN.

THE AUTODROME AND ITS ALTERNATIVE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Much has been said of late of a motor-car track or autodrome, but one of the difficulties seems to be in the choice of a suitable track. Two miles from Lowestoft, to wit, at Oulton Broad, there are some capital marshes always dry, and if a track were arranged there to run out by the river and back by the fringe of the marshes, a clear circuit of about eighteen miles might be arranged and variety obtained too. The run out to Beccles would be flat, but with plenty of gradual curves, and the run home could be arranged for rises, some of which would be natural. Above all the cost of the ground should be very reasonable. The distance from town is not excessive—100 miles—and Lowestoft is a good centre. All things considered, it is a spot that should receive attention when the time comes along.—Yours truly,

MAWDSLEY BROOKE.

BALLOON-STEERING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Accidental discoveries frequently bring about far-reaching results. The discovery of petroleum, firstly, and the invention of the petroleum engine, secondly, have brought air navigation to a final solution. I am not an aeronaut myself, but I have followed the subject with experiments over long years, I collected almost every existing publication and engraving upon the subject. From a study of old engravings the problem would appear to have been solved in the early part of the last century, since theory appears to have been complied with, and the balloon of Mr. Santos-Dumont approaches very nearly to some of the old designs. Early failure was undoubtedly due to the want of motive power, or the use of a motor far too heavy and too weak for aerial work.

As a personal friend, I wish Mr. Santos-Dumont complete success, partial success he has already gained. He has taken advantage of the great power, for given weight, obtainable from the petroleum engine, and combined his general knowledge on ballooning with this boon, adding a necessary adjunct, great pluck and presence of mind. The main condition necessary for steering in the air is, firstly, to have sufficient power to combat the air currents, which are so much more rapid than currents in streams and rivers. Secondly, the design must be such, that all the acting forces shall have a resultant parallel to earth's tangent

at the point below the balloon, and thus enable the air vessel to proceed in a straight line. Thirdly, a suitable steering apparatus must exist, and this is well thought out and acts in calm weather, in the Santos-Dumont balloon.

But there are far larger problems to be coped with later, such as air-machines with no balloon to support the weight, and other matters. Let us, however, first succeed in what inventors and designers are doing to-day, then advance step by step. I was shown all the details of the Santos-Dumont balloon by the inventor himself, and the "pull" of the structure is remarkable when the engine is going.

The motor gives out 16 h.p., and the frame was hanging by long cords from the roof. When the screw was at work the "pull" to keep the frame from advancing was said to be 80 kilos. At any rate it was as much as I could do to resist the advance of the framework, by holding a rope with both feet planted on the ground. Schemes exist for making light motors to give 60, 80, and up to 300 h.p., hence, at no distant date, steering in windy weather may become feasible.—Yours faithfully,

DAVID L. SALOMONS.

MOTOR-CAR REPAIRS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I cannot too strongly agree with your remarks about motor-car repairs in your last issue. Generally bicycle makers, plumbers, blacksmiths, and in one case I know a confectioner blooming forth as a bicycle maker, call themselves motor-car repairers. A motor is a piece of delicate engineering work, and although an old motorist engineer, with twenty years experience, I sometimes feel puzzled. How these men can feel at home without skill, training, etc., I do not understand. And when I see a car costing three, four, or five hundred pounds, put in their hands, I shiver for the car's sake and for the owner's pocket. Why not adopt the system of no cure no pay. If a man calls himself an engineer, he ought to be such, and if he is not, he should not attempt to obtain work by false pretences.—Yours truly,

M. G. LACROIX.

THE OVERHEATING OF EXHAUST VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having recently purchased a motor-car, I find one of the great faults of this means of locomotion is the worry caused by the overheating of the exhaust valves, which necessitates frequent renewal and constant "grinding in." I am writing to ask if your readers find this occurs generally or whether it is a special fault of my motor. If this is the case, is there no remedy? —Yours truly,

H. GREGSON.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As I have recently purchased a Werner motor-bicycle I should like, with your permission, to ask a few questions of some of your readers who have had experience of same. In running down hill with exhaust valve open, should the air-admission valve on handle bar be closed or open? I find when open the valve rattles. In this hilly county of Devon I find after a run of fifteen to twenty miles, using the motor practically continuously, that the oil does not feed fast enough, and I have had occasion to open the oil tank and blow through. I should like to know whether this is unusual. I have used Pratt's motor spirit up to now, as petrol seems difficult to obtain here; is this as suitable as other makes? Instructions say paraffin should be injected into cylinder before starting; does this mean ordinary petroleum or petrol? I have used nothing up to now and had no trouble, but possibly there would be less friction if something were used, only I am uncertain as to what oil to use.

I am under the impression that I have seen an advertisement of an insurance company who undertake third-party risks for motorists, but I cannot find the advertisement now. I should be glad of address of same.—Yours faithfully,

H. G. E. C.

MR. F. MUHLENKAMP, of Brighton, writes:—"I should like to draw the attention of any fellow automobilists who may

unfortunately be stranded at Stevenage (Hertfordshire) to the firm of Gillespie and Robertson, situated on the Great North Road, who rendered me invaluable assistance on Sunday, at eleven o'clock at night, when I had unfortunately punctured. They intend stocking petrol, and as they take a great interest in motor-cars will, I feel sure, do everything to assist anyone in distress."

THE West Croydon Engineering Company (late Hirst and Co.) write:—"We notice your account of the trial 'Mossberg v. Wotton,' in which our Mr. Hirst appeared to say that the car was in our hands from May to September. This, we think, is misleading to the public and rather detrimental to us, as we only took the car to pieces in May, sent the parts to the Mossberg Company, and waited till the end of August for their return. You will, therefore, see that we did not actually have the work in hand during the long period mentioned."

MESSRS. CARLESS, CAPEL, AND LEONARD write:—"Referring to the deplorable accident which happened in the neighbourhood of our works on Saturday last, we should be obliged if you would make it known that the works were not all affected, and that our business is being carried on as usual."

A DEMAND is springing up for motor-cars in India. A serious difficulty, however, is met with in the non-supply of petrol. A Rajah in a state in South India is reported to have imported a fine car from France, and taken out a French engineer specially to look after it, but though he has tried everywhere in India he cannot get the *essence* with which to drive the car.

THE De Dion-Bouton Motorette Company, of Brooklyn, N.Y., is making preparations for placing on the market a De Dion motor of 8 h.p., having arranged for the importation of this, the latest De Dion motor, from the French factory for the present. The new motor has a cylinder bore of 100 mm. and a stroke of 110 mm. It weighs 140 lbs., including the fly-wheel and the friction clutch.

THE Association of Automobilists of Central Europe has just concluded an advantageous arrangement with the *Societe Generale d'Assurance* of Stuttgart, by which all its members, automobilists, or employees of firms engaged in the automobile industry, are insured against accidents. Policies are valid in Germany, Austria, and Switzerland, and can be extended to any other country in Europe.

As mentioned in our last issue, the firm of Messrs. Dennis Brothers, Guildford, has just been registered as a limited company with a capital of £30,000, the shares being readily taken up privately. Another factory is to be commenced this week and is to be ready in time for next year's trade. The company are bringing a new 8 h.p. four-seated motor-car, which they intend making their chief manufacture for 1902.

It is reported that the Automobile Club of America is soon to take action on the speed question, which has been forced to the front again by the reckless driving of some of its members. The recent stand the Club took on this subject aided greatly in securing the favourable legislation now governing the use of automobiles upon the highways of New York State, and any lapse from this broad and reasonable position on the Club's part is likely to seriously impair its influence.

ELECTRIC PROPULSION, LIMITED, is the style of a company which has been formed with a capital of £100,000 in £1 shares, of which the present issue is 75,000 shares—20,000 to be allotted to the vendor as part-payment of the purchase money, while the remaining 55,000 shares are now offered for public subscription. The company will acquire two British patents, one for an electric motor and the other for an electric battery, covering what is known as the "Still" system of electric propulsion for use in light motor carriages. The purchase price of the patents is fixed at £50,000. A full subscription will provide the company with at least £25,000 working capital, but the prospectus specifies £12,000 as the minimum subscription upon which the directors may proceed to allotment.

THE MUNGER MOTOR-CAR TIRE.

TO provide a tire combining the advantages of a pneumatic with those of a solid tire has been essayed by many inventors, and it has been pointed out frequently that it would be very desirable for automobile work to have some kind of a pneumatic tire which, even if punctured, would bring the vehicle home easily and without injury to the tire itself or the car. It is to meet these requirements that the Munger vehicle tire, shown

FIGS. 1 AND 2.—THE TYRE INFLATED AND DEFLATED.

in the accompanying illustrations, has been introduced. Instead of the tire, which is of the single tube type, being entirely hollow inside, as is the usual pneumatic, it is fitted with two dovetail-shaped interior rubber projections, which, if the air escapes from any cause, such as a puncture, will cushion one upon the other, giving all the resiliency of the best type of cushion tire. The method of fastening the tire to the rim is very ingenious: the inner circumference of the rim is tapered, and the face of the steel tire is also tapered to conform to it, and the tire can be easily attached and detached by means of the outside rings and bolts. The tire is secured to the entire surface of the rim, no bolts or lugs being placed

FIG. 3.—METHOD OF FIXING TYRE.

in it to weaken the fabric or cause unequal pressure to bear when they are not placed equidistance apart, and this method, it is claimed, prevents all possibility of chafing on the edge of the rim and gives quick response to the application of power without any drag. The tendency of air confined in any chamber is to form that chamber round, but in the Munger tire this tendency forces the tread buffer outward, causing the outer surface to assume the oval form on the tread, so that there is less contact with the road and friction is minimised. It is also stated that the tread buffer in the Munger tire presents greater surface than in the round

tire for the displacement of air, and consequently can be used with less inflation. It is claimed for the tires, which are made by the Munger Vehicle Tire Company, of New Brunswick, N.J., that they are practically indestructible and puncture proof.

THE MAYBACH CARBURETTOR ACTION.

(By a Correspondent.)

AT last the would-be monopolists of the motor trade have met with serious opposition by the tearing to shreds of the Maybach patent, which results from the decision of Mr. Justice Farwell. No one who has read the *Journal*, or who attended the meeting at the Automobile Club in February, 1900, at which Mr. John Scott-Montagu, M.P., boldly attacked the Lawson group and their patents, will be surprised at the Court's decision, and every honest automobilist who has the welfare of British trade at heart will be thoroughly pleased.

The Automobile Mutual Protection Association, who were the real defendants in the case, had long been seeking an opportunity of coming to conclusions with the British Motor Traction Company, Ltd. It would take too much space for me to describe, step by step, the difficulties which have been invented to try to avoid a fair fight, but I may mention one or two, illustrative of the proceedings of the would-be monopolists. Mr. Justice Farwell's remarks with regard to the Sherrin action need no comment. He says, "It was urged that Mr. Justice Kekewich decided the contrary as regards Butler, but it is clear that the evidence before him was of a very different character, and the defendant, in that case, seems to have been in a very accommodating mood when in the box." There is not a reader of the *Journal* who will not interpret these words in the only way possible. The second case I may mention, and which has been the subject of some correspondence in the *Journal*, was the attempt made to induce the defendant, Mr. Friswell, to consent to a judgment after it had been agreed to treat his action as a test case, and after other defendants had agreed to abide by its result.

Mr. Justice Farwell's Court on Wednesday, Thursday, and Friday of last week was filled with familiar faces. I remarked Mr. Rolls very much interested, and Mr. Alfred Bird turned up for half an hour, shaking his head wisely at the cross-examination of Sir Frederick Bramwell. Messrs. Dugald-Clerk and Swinburne both seemed staggered with the suggestion that a Butler or a Wilkinson would work at any speed, or with the idea that a so-called Maybach would work with the level of the oil anywhere but just at the mouth of the nozzle. Mr. S. F. Edge broke down completely before Mr. Terrell, K.C.'s, cross-examination, and his name was never mentioned again, though he sat tight on the front bench, looking more than thoroughly *en panne*. The defendants had three expert witnesses—namely, Sir Frederick Bramwell, Mr. Worby Beaumont, and Mr. R. E. Philipps; but so strong was their case and so just their cause that Mr. Terrell only called Sir Frederick Bramwell. Mr. Astell was called to prove the working of the Butler and the Wilkinson, and gave evidence in the most amusing manner. It was comic to watch Mr. Walter struggling between the suggestions of Mr. Dugald-Clerk, who was prompting him from behind, and the evidence of the actual practical experience of Mr. Astell, who was not in the least discountenanced by Mr. Walter's furious, "Don't you sir me." "Do you mean to tell me that your engine, with a Wilkinson carburettor, turned at the rate of 2,000 revolutions per minute without missing fire?" to which Mr. Astell found nothing more simple than to reply, "Why, yes, sir, of course it did. There is nothing strange about that," and all the automobilists present were sorry for Mr. Walter, and wondered whatever Mr. Dugald-Clerk could possibly be driving at.

The verdict given on Monday was so complete and crushing that it is difficult to see where grounds for any chance of success can lie in appeal, and I doubt whether the plaintiffs will have the courage to go on, but, in any case, I understand that the Association is prepared to go to the House of Lords if necessary.

THE WERNER MOTOR-BICYCLE.

THE motor-bicycle, attractive as it is from its simplicity, cheapness and ease of storage, not to mention the advantages which a single-track machine presents on rough roads, has taken some time in achieving any measure of popularity. This is, to some extent, due to the supposition that it is not altogether a safe machine, and a few words on this point may suitably preface a description of its management. The common bicycle, as we know, is at times liable to side slip on greasy roads, as are all pneumatic-tired vehicles; and in a two-wheel machine this usually involves a fall, the more serious as speed is greater; but the skilful rider knows under what circumstances this is likely to happen, and obviates it by slow and careful riding. The increased weight of a motor-bicycle, if suitably distributed, does not increase this danger at the same speeds; and if the rider will observe the same caution and go at the same speed over grease with his motor that he would with his ordinary bicycle, he will negotiate it with equal safety.

The suitable distribution of the weight to ensure stability involves its being placed as far as possible high up on the machine, to obtain a high centre of gravity. This point is not generally realised, but may be easily illustrated by the ease of balancing a billiard cue or a hammer on the hand with the heavy end up, and the difficulty of doing it the reverse way. Motor-bicycles have been built with the engine in almost every possible position, but the most successful and popular type up to the present time has been the Werner, in which the motor is placed in front of the handle-bar and drives the front wheel by a thick narrow belt, the speed ratio being about 8 to 1. It is air-cooled, and has a bore of 65 mm., with a stroke of 72 mm., and a nominal horse-power of $1\frac{1}{2}$. One handle forms the usual switch for controlling the ignition, while adjoining the other is a movable ferrule with a $\frac{3}{4}$ -in. hole, the rotation of which regulates the air supply, and thereby the quality of "mixture," the petrol vapour passing from the carburettor up the steering pillar, and there mixing with the air arriving along the hollow handle bar. On the top of the cylinder is the dome covering the inlet valve, surmounted by a small handle which works a throttle, and which when turned forwards closes same and opens a hole in the top of the dome, admitting cold air to the cylinder. Behind the middle of the handle bar is a handle, working vertically, for regulating the time of ignition; when this is raised it retards the ignition for starting, and when lowered advances it for running at speed. The petrol tank is suspended from the top bar of the frame, and is divided into three compartments, of which the rear one contains the two-cell accumulator, the centre one (which is entirely closed except for the filling aperture and a tap communicating with the bottom of front compartment) the petrol, and the front forms the carburettor. This last is kept filled to the depth of an inch or so through the tap referred to on the bird-fountain principle, and has a perforated cloth-enwrapped frame inverted in it, from the interior of which the pipe to the

engine takes its supply of vapour. The handle of the tap protrudes at the top of the tank, and should be kept turned off when not in use to avoid overfilling the carburettor, which can be emptied by the screw plug on the left side.

In order to learn the management of the machine familiarity with an ordinary free-wheel bicycle is of advantage; the free-wheel is the only point of difficulty which may puzzle the novice and cause a fall when trying to dismount, it being needless to say that a fall, harmless to an ordinary machine, would injure the motor. Having got accustomed to the running of the machine with belt off, the latter may be replaced, and the motor started. To do this the compression cock, which has a long lever resting on the left-hand part of the handle-bar, should be opened, also the tap of carburettor, until the latter is filled up to the level of the plug at the side; if overfilled, the petrol can be run off by this plug, and returned to the tank, the tap being closed during this operation. The opening of the petrol tank should be carefully screwed up, as the proper feeding of the carburettor depends on this being air-tight.

The air inlet at right handle-bar should be partly opened, the ignition handle raised to retard the firing point, throttle opened, and switch (left handle) turned on; the rider can then mount, and get up speed with a little vigorous pedalling (it is preferable to learn on a gentle down grade). On turning off the compression the engine should start with, if necessary, a little manipulation of the air inlet at right handle, which should always be kept as wide open as is consistent with good running, to avoid the evil effects of too rich a mixture. The ignition lever can now be depressed to advance the sparking, when the engine will pick up speed, which can be regulated by the throttle and sparking lever, which latter should of course be raised when engine is running slowly or before stopping. The band brake on the back

THE PARIS-BERLIN RACE—RIVIERRE ON HIS WERNER MOTOR-BICYCLE.

hub will be seen to make a double circuit round the drum, giving it great power for its dimensions, while switching off the current causes the engine to act as a retarding force, sufficient for all but steep hills.

The crank chamber requires a small charge of good lubricating oil, such as Price's heavy "motorine," every twenty miles or so. Half an ounce is quite enough, as an excess is very prejudicial to the running of these small engines, which foul easily, and are very sensitive to the quality of oil used; in fact, if they begin to run poorly during a ride it is generally due to this, and a small can of paraffin should always be carried to inject into the cylinder on such occasions, while the same precaution is necessary on returning from a run, or they will probably not start on the next occasion. The belt fastening is a somewhat weak point, and the holes for the fastener should be punched and then slit back, as a plain slit is apt to tear out. Castor oil, or, perhaps, preferably, Collan oil, which seems an excellent preparation, should be the only dressing employed, though a little belting brick (such as Stern's), is useful to have in the tool-bag for emergency.

With regard to the ignition, the subject has been so fully treated—*passim*—in connection with tricycles, that there is little necessity for further remarks about it, but a spark-gap of little over half a millimetre is about sufficient, as the electrical arrangements are cut rather fine. A dirty trembler is, of course, a possible event, and should be looked for in cases of stoppage, but, perhaps on account of the engine being as a rule kept cleaner than that of a tricycle, it does not seem of such frequent occurrence. The absence of the exhaust lifter, fitted to the earlier machines, seems a somewhat retrograde step, but, of course, may be easily remedied.

With ordinary care devoted to them, users of these machines will, I think, agree that there are few more reliable ones, while, in the event of an absolute *panne*, the removal of the belt will give a bicycle that is little heavier than those we used to ride without grumbling twenty years ago, and can be easily pedalled to the nearest repairer's.

R. W. BUTTEMER.

HERE AND THERE.

THE Locomobile Company of America have just issued an attractive poster to draw attention to their steam cars.

FINLAND has been selected for the scene of a record motor tour by the Grand Duke Cyril Vladimirovich, who is, perhaps, of all the Russian Imperial family, the most enthusiastic on this subject.

MR. CHARLES E. MILLER, of 96, Reade Street, New York, is putting on the market a new collapsible rubber bucket for the use of motorists. It is fitted with a strainer and spout, which enables the user to fill his tank from a brook or water trough without any sediment being deposited in the tank.

SEVENTY-FIVE members of the Chicago Automobile Club recently started to make a tour through the Wisconsin lake region. The party will visit Oconomowoc, Waukesha, Lake Geneva, Delavan, Highland Park and other points of interest. The route includes some of the most beautiful scenery of the lake region.

THE ninth run of the Yorkshire Automobile Club will be to Settle, Ripon, and Harrogate, on Saturday, Sunday, and Monday, August 3rd, 4th, and 5th, leaving Leeds City Square to-day (Saturday) at 2 p.m., and Manningham Park, Bradford, at the same time. Leeds and Bradford contingents meet at Burley-in-Wharfedale. For the convenience of members not wishing to go on the three days' tour, a run to Harrogate has been arranged for Monday at 9 a.m., City Square (Leeds), and Manningham Park (Bradford), entrance near Lister's Monument.

AT a recent meeting of the Automobile Club of America an attempt was made to bring about some sort of a league of the various automobile clubs in the United States. After a thorough discussion it was finally settled to call a convention, to which all the automobile clubs of America will be invited to send delegates, and at which some action will be taken regarding the formation of some sort of a national league. The outcome of this proposition to invite outside clubs to join in holding a convention was that a committee of seven was appointed to take such measures as might be found necessary for the calling of such a convention.

At a meeting of the Enniscorthy Rural Council at Enniscorthy, Ireland, last week a resolution was adopted to the effect:—"That we, the Enniscorthy Rural District Council, hereby call upon the County Council to rescind their resolution refusing permission to use the roads of the county to the Automobile Club of Great Britain, as we consider such a resolution is detrimental to the interests of the country, inasmuch as the money which would be sent to this country is expended elsewhere." In proposing the resolution, Mr. Nowlan said the members of the Automobile Club, if they were allowed to come into Ireland, would spend thousands of pounds, and he could not understand why the members of the County Council refused their permission. The chairman, in putting the resolution, said in his opinion the resolution refusing permission to the Automobile Club to come into the county was the most short-sighted resolution ever passed by a public body.

THE Cardiff Corporation is considering the question of adopting motor dust carts.

AN international automobile exhibition is to be held in Turin, Italy, in May and June, 1902.

THE Newcastle and Gateshead Water Company, Limited, has ordered a Thornycroft steam waggon.

THE motor-car service between Kelsall, Farvin, and Chester has, we hear, been discontinued through lack of support.

FOLKESTONE MOTORS, LTD., are now running motor charabancs at frequent intervals from Folkestone to Sandgate and Hythe.

THE automobile gymkhana which was to have been held at Sheen House Club on Saturday last was abandoned in consequence of the bad weather.

AT a meeting of the Institution of Mechanical Engineers at Barrow, on Wednesday, Mr. Holroyd Smith read a paper on the development of motor-cars.

BY the capsizing of a motor-car into a ditch near Byfleet, on Tuesday, a young lady of Clapham was thrown out and sustained injury to the ribs and severe shock.

THE Bradford Fire Brigade Committee has directed Chief Officer Scott to prepare a report on the feasibility, or otherwise, of applying motor-traction to the local fire-engines.

MR. E. COLLINS, of 2, Bishopgate Green, Coventry, has taken up the sale of the Werner motor-bicycle, and will be working the county of Warwick for some little time to come.

MR. VICTOR HART, of 228, Brixton Hill, S.W., has been appointed by Messrs. Botwoods, of Ipswich, agent for the Teras (Gobron-Brillié) cars for London and the South of England.

IN addition to holding the district agency for Benz cars, Messrs. Simkiss and Knighton, of Parliament Street, Derby, are well equipped to undertake repairs to all types of motor-cars.

MR. LONG announced in the House of Commons last week that he was considering representations from local authorities as to allowing motor-cars to be driven at greater speed in rural than in urban districts.

A MANCHESTER motorist was fined 10s. and costs for causing an obstruction by leaving his motor-car unattended at Alderley Edge whilst he went to watch the Manchester Wheelers' hill-climbing competition.

THE Accumulator Industries, Limited, notify us that their registered offices have been transferred to the works premises at Maybury, Woking, Surrey. The London offices remain as heretofore, 14, Silver Street, Bloomsbury, W.C.

A WALTON motorist was recently summoned for driving his motor-car on the footpath in High Street, Walton. Defendant pleaded that the road was being repaired, and the Bench dismissed the summons on payment of 8s. 6d. costs.

THE Singer Cycle Company are issuing an artistically arranged pamphlet anent their motor-cycles. An excellent diagram makes the mechanism of the "Singer" motor wheel quite clear, and the rest of the booklet is devoted to testimonials which should carry weight.

WE are informed that the business of the Bromley Autocar Company is about to be taken over by a company having a capital of £7,500. As well as the development of the motor trade, the company's objects include the starting of several services of motor buses.

A MOTOR-BRAKE now runs daily between Cardigan and Newcastle-Emlyn, doing the ten miles journey under the hour. It is also stated that the Great Western Railway Company intend connecting their terminus at Cardigan with that of Newcastle-Emlyn by a service of motor-vehicles.

MESSRS. R. BURLAND AND SONS, of Bishopgate, Wigan, stock petrol, oils, and lubricants. Mr. R. O. Burland, of the firm, acted as local honorary secretary during the recent trials of the Liverpool Self-propelled Traffic Association, and motorists will find in him a sympathetic and attentive caterer for their wants.

IN connection with the forthcoming Glasgow trials, the Automobile Club has decided to extend the period for entries of delivery vehicles and for vehicles propelled by electricity, and also for the entry of tires and other parts of automobiles, including ignition apparatus, until Wednesday, the 14th inst., at twelve noon.

THE Forman Motor Company, of Day's Lane, Coventry, are about to place on the market a small motor suitable for a motor-bicycle. The engine will be fitted with a patent automatic oil feed, doing away with the large carburettor now in vogue, and giving greater facilities for carrying a larger supply of petrol.

TENDERS are being invited for the supply of two motor (not electric) omnibuses for the Metropolitan Asylums Board. Forms of tender and general particulars can be obtained upon application at the office of the Board, Victoria Embankment, E.C., where tenders are to be delivered by 10 a.m. on September 23rd.

FOLKESTONE MOTORS, Limited, has been registered with a capital of £5,000, to manufacture and deal in motor-cars. The first directors (to number not less than three nor more than seven) are T. F. Maltby (chairman), C. E. Perry, and H. R. Martingell. The registered office is at Bank Chambers, 27, Sandgate Road, Folkestone.

MR. VAN RADEN, of Coventry, has introduced an improvement in his watch-shaped volt-meter and combined volt and ampéremeter. He has now arranged the reading of the volt-meter over a larger surface, and from 0 to 1, and from 1 to 2 volts divided into tenths of volts, so that the exact voltage of small cells can be read in tenths of volts.

WE learn that the City and Suburban Electric Carriage Company, of 6, Denman Street, Piccadilly Circus, London, W., have been favoured with an order from Her Majesty the Queen for an electric Victrolite exactly similar to the one previously supplied to Her Majesty, and which she intends for presentation to her sister, the Dowager Empress of Russia.

WHILE a party of excursionists were at Hopton on Sunday evening one of them slipped from the step of the brake and dislocated his kneecap. A motor-car belonging to Lowestoft, privately engaged by some ladies and gentlemen, was passing at the time, and the occupants consented to convey the man to the hospital, where he arrived in about twenty minutes. The party wish to thank the unknown occupants of the motor-car.

THE Borough Councils are being appealed to by the National Cyclists' Union on the subject of the excessive watering of roads and dangerous tramlines. The Union suggests more frequent collection of dust, the use of a finer rose in the watering-cart pipes, and the giving of instructions to road surveyors to keep a more watchful eye on the tramlines, so that the latter should be always kept flush with the paving.

BROMLEY is about to extend its motor-car service, that to Biggin Hill having demonstrated the value of such communication with outlying districts. The local automobile company now proposes to run a regular service to Sevenoaks and intermediate villages. Rumour is also connecting Bromley with Catford,

Beckenham, and even Croydon, but up to the present these last routes exist only in an imaginary stage.

IN connection with the Flower Show at Blankney, Lincolnshire, on Wednesday last week, the usual sports were held. Included in the events was a Motor Pursuit Race (ten laps). Winners of heats: T. H. Tessier, London, bicycle (Werner); A. Plumridge, Lincoln, 2½ h.p. tricycle. Final: Plumridge gained an early advantage, and kept it, though Tessier recovered some ground in the last two laps. Time, 4 min. 40 secs.

ONE of the most refreshing sights seen in London during the hot weather last week was the motor water-van now operating in the Strand and Holborn. It is a great improvement on the old cart, inasmuch as the van moves so much quicker that the water is really sprinkled, without leaving pools in the road. Judging by appearances, the van does quite three times as much work as a horse-drawn vehicle, and therefore it is not necessary to deluge the road with water, since the same space can be covered three times to one as formerly.

AT the last meeting of the Gravesend Town Council the Watch Committee reported that Mr. J. Baxter, of Harmer Street, had submitted for inspection four motor hackney carriages to be licensed to ply for hire in Gravesend, to run between the following places at the following prices:—Brunswick Road to Parrock Street, 1d.; Parrock Street to Elephant's Head, 1d.; Elephant's

Head to Leather Bottle, 1d.; Leather Bottle to Huggens' College, 1d.; Clock Tower to Huggens' College, 2d.; or the complete journey 3d. Licenses for the four vehicles were granted.

IRISH motoring circles have incurred a great loss by the death, announced in our last issue, of Mr. J. McDonald, of Dublin, who was a keen and enthusiastic motorist and manager of the Cycle and Motor Company's depot in that city. It is a matter of great

concern to his many friends to learn that Mr. McDonald's widow and children are left practically penniless, and a fund to assist them is being raised, of which Mr. D. W. Alexander, 1, Stephen's Green, Dublin, is the treasurer, who will be pleased to receive donations. We feel sure that many of our readers who had the pleasure of Mr. McDonald's acquaintance will be glad of this opportunity of showing respect to his memory.

ONE of the finest motor 'buses constructed at Coventry by the Motor Manufacturing Company, Limited, has just been supplied to Craiglockhart Hydropathic Company, Limited, through its Scottish representative, Mr. John Love. The vehicle, which has been specially designed for the work, is of 8 nominal h.p., developing 10½ h.p. Entrance for passengers is effected from the left side at the front, two broad steps making access or exit easy. A glass screen and door separate the passengers from the driver, who is protected from the weather by a glass window fixed to the dash board. The car is upholstered in morocco leather, and painted in primrose and black. It is now running between the Hydro and the station at Merchiston, N.B., for the convenience of guests.

THE 5-TON ELECTRICAL WAGONS BUILT BY HERR HEINRICH SCHEELE, OF COLOGNE.
(Cliché de) [Allgemeine Automobile-Zeitung.]

THE MAYBACH FLOAT-FEED CARBURETTOR PATENT ACTION.

Is the Chancery Division of the High Court of Justice, on Tuesday, last week, Mr. Justice Farwell had before him the case of the British Motor Traction Company, Ltd., and others, *v.* Friswell and another. It was an action brought to restrain the alleged infringement of the Maybach patent, No. 16,072 of 1893, for improvements in the method of producing the explosive mixture of hydrocarbon engines. The defence was shortly a denial of the infringement, and that the patent was bad by reason of certain anticipations. Mr. Fletcher Moulton, K.C., Mr. A. J. Walter, and Mr. Hume (instructed by Messrs. J. B. and F. Purchase), appeared for the plaintiffs; while Mr. T. Terrell, K.C., Mr. Roger Wallace, K.C., and Mr. E. G. Mears (instructed by Messrs. Firth and Co.), represented defendants.

Mr. Moulton, in opening, said this was a patent which had already been sustained. It was a patent for a carburettor, whereby the petroleum which were used—especially the not very light petroleum employed—in motor-carriages, could be thoroughly and effectively turned into vapour for the purpose of being used as the explosive mixture in the cylinder; but the characteristic of this carburettor—which was practically far more largely used than any other—was this: It was so regular in the automatic way in which it acted that one could use it for speeds which varied from one to ten. That was to say, one could use it for eighty revolutions per minute, or 800 revolutions, because, by this arrangement, the suck was so powerful during the short time it lasted, and, when slow, was so little powerful that the mixture was the same at all speeds. No other device did its work so efficiently as this. This meant half the battle in connection with motor-cars; and, if he proved this, it was inevitable that merit must follow. Part of the

evidence would show that defendant did plaintiffs the honour of taking the patent, but it would be alleged that it had been anticipated. He pointed out that some of the anticipations were dealt with in the previous case, and some of them were new; but he was perfectly certain his friends could not prove that one of them would do the work as well as the plaintiffs'. [Mr. Terrell: Indeed, we shall.] They were all different arrangements—radically different in principle, some of them—but all of them markedly different in the arrangement of the parts. That it was novel to suck in the supply of petroleum by means of the suck of piston, counsel did not pretend; but to do it successfully, as in this case, was another thing. Dealing with the infringement, the main difference between it and that shown in Fig. 1, was this: In Fig. 1 the needle was fixed to the float and pointed upwards. What the defendant had done was this: He had a couple of "toggles," so that when the float went up the needle went down, and thus he placed the hole at the bottom. When the float went up it plugged the hole, and the needle went down. It was exactly the same thing here. The claim counsel relied on was claim 1, "The method of producing the explosive mixture, in hydrocarbon engines, consisting in sucking liquid hydrocarbon out of a nozzle *c* fed from supply basin *a* by pipe *c*, and extending into connection *b* between air inlet channel *b* and mixing chamber *b*, said sucking being performed by the air sucked by the working piston through said channel *b*, connection *b*, and mixing chamber *b*, and the level of the hydrocarbon within basin *a* being kept on the same height by a swimmer valve *d*, acting on the main supply tube *e*, substantially as described." Counsel added that what the defendant had done was the mere mechanical equivalent of the plaintiffs' patent.

Mr. Dugald Clerk was the first witness for the plaintiffs. He described the object of the invention as enabling a charge of oil to be taken into a motor cylinder of an engine, always in strict proportion to the air entering the cylinder. It was necessary, to obtain an explosive mixture, that the proportion should be kept within very narrow limits. For instance, in the gas engine, they had one volume of gas entering eight or nine volumes of air; and what they needed in the oil engine was a small volume of air to make an explosive mixture in the same proportion when vaporised. It was very important in the motor-carriage, or in any oil engine, that the proportion of oil and air should remain constant automatically, and Maybach accomplished it in a very simple way. He generally bore out

counsel's opening statements, and added that he had read the prior specifications pleaded by the defendant, but did not find the plaintiffs' invention there. Defendant had attempted to do the same thing as the plaintiffs, but it was a failure. The article produced was, in witness's opinion, an infringement. Cross-examined by Mr. Terrell, witness admitted that nowhere in the letterpress of the specification did he find any statement as to what the level of the liquid was to be in C 1; but he understood it to be shown in the drawing. At this point the hearing was adjourned.

On Wednesday, the 24th ult., Mr. Dugald Clerk concluded his evidence, and was followed by Mr. James Swinburne, who corroborated; but in cross-examination he admitted that he had never seen a Maybach exactly like Fig. 1 in the specification, or exactly like Fig. 2; nor had he ever tried to see if Figs. 1, 2, 3 would work exactly as there shown. There was an arrangement for varying the air-draught, and such an arrangement was always necessary in a governing engine. An engineer would have no difficulty in understanding the drawings. Witness doubted whether it was important that the liquid admitted at the nozzle should strike the top of the mixing chamber. It did not matter whether it did or not, and would work just as well in either case so long as it was well sprayed. Mr. A. J. Boulton and Mr. S. F. Edge were next examined. The latter stated that some years ago he tried a Butler carburettor, and it looked to him a complete failure for motor-car work.

Mr. Terrell, opening the case for the defence, said that the claim of the patentee was for a process of working which, in this connection could have but one meaning. He put it to Mr. Swinburne that each one of the steps of the process was to be found in Butler and in Wilkinson if his (Mr. Terrell's) view was right. If that were so, then the defendants ought to succeed. Let them see what a man claimed. Mr. Justice Buckley had said that one ought to read the whole specification in construing a claim, but the Court of Appeal were not of that opinion, and it was pretty obvious why. As to Wilkinson, they had it that he had an air-tight chamber, and so had Maybach. Wilkinson did not say whether it was an air-tight chamber or not, but counsel was going to show that he meant an air-tight chamber, and that Maybach did not. The defendants said that this was a claim for a method, and the plaintiffs were in this dilemma: If they said their patent was sufficient to catch the defendants as to infringement, the defendants answered that for the same reason the patent was bad by reason of anticipation. He asked the Court to put a construction on Wilkinson which was simple and natural, and he submitted there could be no infringement of letters patent which had been anticipated. As to the judgment of Mr. Justice Kekewich against Sherrin, which had been referred to, counsel said it was not a judgment upon a matter of law, but only of fact, and as such it could only be cited here. From that point of view he asked the Court now to look at the additional evidence here and judge accordingly. The hearing was again adjourned.

On Thursday, the 25th ult., Sir Frederick Bramwell was the first witness for the defence, and he said that he found all the essential details of Butler in Maybach; and, with regard to the alleged infringement, he found the outlet nozzle in Wilkinson that was in Maybach. In cross-examination by Mr. Walter witness admitted that he had had no practical experience of these oil engines, nor much experience of the conditions and details of working them. Mr. W. Astell, manager of the New Orleans Motor Company, having also given evidence, counsel addressed the Court, and his Lordship reserved judgment.

Mr. Justice Farwell delivered his judgment on Monday in the following words:—

The plaintiffs are the owners of letters patent 16,072 of 1893 for improvements in the method of producing the explosive mixture in hydrocarbon engines, and they claim an injunction to restrain the defendants from infringing their patent. The defendants deny the infringement, and say that if they do infringe, the plaintiffs' patent is bad. The original patentee was one Maybach, and his specification has been considerably amended. He describes his invention thus:—"My invention relates to hydrocarbon engines, in which the explosive mixture is produced from air and a liquid hydrocarbon, as petroleum, ligroin, benzine, naphtha, or the like, and my improvements in the composing or forming of this mixture relate to the manner in which the liquid hydrocarbon is moved and dispersed by, and thoroughly mixed with, the air sucked by the working piston into the cylinder through a special feeding channel, into which a nozzle supplying the hydrocarbon extends in any direction, and at any place, and the object of my improvements is to produce a mixture of never-varying composition, irrespective of the speed of the engine as well as that of the piston in different parts of the path of this latter." His first claim in the original specifications ran thus:—"The method of producing the explosive mixture in hydrocarbon engines, consisting in sucking liquid hydrocarbon by the air sucked by the working piston, substantially as described." This was followed by claim six, which is now claim one, and runs thus:—"The method of producing the explosive mixture in hydrocarbon engines, consisting in sucking liquid hydrocarbon out of a nozzle C 1, fed from supply basin *a* by pipe *c* and extending into connexion *b* 2 between air-inlet-chamber *b* 1 and mixing chamber *b*, said sucking being performed by the air sucked by the working piston through said channel *b* 1, connexion *b* 2, and mixing chamber *b*, and the level of the hydrocarbon within basin *a* being kept on the same height by a swimmer valve *d*, acting on the main supply tube *e*, substantially as described." The intermediate clauses, also now struck out,

claimed separately and respectively each of the various items which are combined in six, except the preservation of the level by the swimmer valve. It appears from the evidence that in these machines it is essential that the charge of oil to be taken into the cylinder of the engine should be always in strict proportion to the air entering the cylinder; that it is necessary in order to obtain an explosive mixture that the proportion should be kept very nearly constant, and that this is most effectually done by causing the oil to be sucked by means of the air sucked by the working piston; as the velocity of the piston is increased the rush of air is increased, and as the rush of air is increased the quantity of oil drawn out is increased also, and *vice versa*. The first question is the true construction of the patent, and, as a matter of construction, I hold that the patent is for a method, not for a machine. It is true that the method is and must almost necessarily be defined by reference to a machine in order to make it intelligible, but the gist of the claim is for the method. I will illustrate my meaning by referring to the great case of James Watt's patent for steam engines, "*Boulton v. Bull*" (2 H. Bl., 463; 3 R. R., 439). Lord Chief Justice Eyre says at p. 470:—"The substance of the invention is a discovery that the condensing the steam out of the cylinder, the protecting the cylinder from the external air, and keeping it hot to the degree of steam-heat, will lessen the consumption of steam. This is no abstract principle, it is in its very statement clothed with practical application"; and at p. 471, "Some machinery, it is true, must be employed, but the machinery is not of the essence of the invention but incidental to it." Again, Mr. Justice Rorke, at p. 451, says:—"When the present patentee set his inventive faculties to work he found fire-engines already in existence and the natural qualities of steam already known and mechanically used. He only invented an improvement in the mechanism by which they might be employed to greater advantage. There is no newly-discovered natural principle as to steam, nor any new mechanical principle in his machine; the only invention is a new mechanical employment of principles already known. The objection is that there is no drawing or model of a particular engine; and where is the necessity for such drawing or model if the specification is intelligible without it? Had a drawing or model been made, and any man copied the improvement, and made a machine in a different form, no doubt this would have been an infringement of the patent. Why? Because the mechanical improvement would have been introduced into the machine, though the form was varied. It follows from thence that the mechanical improvement, and not the form of the machine, is the object of the patent." So here, I hold that the mechanical improvement, not the form, is the object of the patent, and that the machine is not of the essence of the invention, but incidental to it. In Watt's case there were no drawings at all, and it is said that the use of the lettered descriptions in the drawings to the present specification shows that the patent is not a method patent, pure and simple. No doubt the use of letters in a patent for a machine has the effect of limiting and restricting the generality of the claim, but I take the specification as a whole, and, having regard to the first paragraph followed by the words "In order to make my invention more clear, I refer to the accompanying drawing, in which similar letters denote similar parts," and to the fact that this is left untouched in the amended specification, I have come to the conclusion that the claim is for a method defined as stated above, and that the letters are used for the purpose of illustration only and not by way of delimitation and restriction. I am confirmed in this view by the difficulty that I have found in discovering on any other construction what the real gist of the supposed invention is—a difficulty which appears to be shared by the plaintiffs' experts and counsel. It is said that the preservation of the level of the liquid immediately below the nozzle is the essence of it—i.e., that the patentee discovered that it was essential to keep the oil close under the nozzle and to keep the nozzle pointing in an upward direction so that the oil should not run out. I can only say that he does not say so. It is strange, if this be so, that all express reference to it and all explanation of its importance are omitted from the specification, and as regards the nozzles the contrary appears on page 1 of the specification, where it is stated that a nozzle extends in any direction and at any place. Moreover, on the evidence it is really almost immaterial. A motor-car will run just as well for all ordinary purposes although the oil be a short way down the pipe, and it is to be remembered that these carburettors are very small and that it is a matter of the fraction of an inch. It was suggested that the striking of the jet of oil on the top of the chamber immediately above the nozzle was of importance, but this was not seriously pressed, and it is to be observed that this element does not occur in Fig. 3. The truth is that Maybach thought that he had discovered the mode of maintaining the proportion of the air and oil by the action of the piston, and his amended patent is merely an attempt to save something from the wreck when he found that his supposed discovery was old. Unless the patent is for the method defined and illustrated by reference to any nozzle, channel, mixing chamber, and so on of any sort, it fails, in my opinion, for want of subject-matter. But if it be for such a method, then it fails for want of novelty. Maybach told the world nothing that was unknown before, and the actual method by nozzle, channel, mixing chamber, and so on, had been anticipated by Wilkinson and Butler. It was urged that Mr. Justice Kekewich decided the contrary as regards Butler, but it is clear that the evidence before him was of a very different character, and the defendant in that case seems to have been in a very accommodating mood when in the box. In this case it has been proved that Butler's will work, and will work as well as, if not better than, any other. I do not place so much reliance

on Wilkinson's, because the experiments were not so satisfactory. If a machine made according to a prior specification is relied on as a practical anticipation, the machine ought to be made according to the whole specification, and not with omissions the materiality of which would raise a fresh and by-issue. Finally, even if the patent were valid for a machine, I should be of opinion that the defendants had not infringed. The first claim states in terms that the sucking is performed by the air sucked by the working piston; in the defendants' the air comes down in opposition to, and not in accordance with, the outcome of the jet. The claim is for direct suction by reason of the vacuum caused by the piston as distinct from the induced vacuum caused by the air rushing past, used by the defendant. The plaintiffs' claim fails, and their action must be dismissed with costs.

THE METROPOLITAN MOTOR MANUFACTURING COMPANY, LIMITED.

A PETITION for the compulsory winding-up of the Metropolitan Motor Manufacturing Company, Limited, has been presented by Mr. A. E. Creease. Mr. J. Edwards, who supported, asked for an adjournment in order to amend the petition by ordering another affidavit. A few days ago the company held a meeting and passed what was stated to be a resolution for voluntary liquidation. Mr. Vaughan Williams opposed, and asked that the petition be dismissed. Mr. Edwards said there was a charge against the present liquidator that he had wasted the assets, and he asked for an undertaking that he should not deal further with them pending an adjournment. His Lordship said that Mr. Edwards was not in a position to ask for that or anything else at present. He would, however, adjourn the hearing for a week, the petitioner to pay the costs.

PETROLEUM SPIRIT FOR MOTOR-CARS.

At Southwark, last week, Mr. J. W. Godfrey, from the Solicitors' Department of the London County Council, attended with regard to the council's pending appeal against the dismissal of the prosecution under the Petroleum Acts, on April the 24th. The case was one of special interest to the motor-car industry, the defendant being Mr. Montague Stanley Napier, of Vine Street, York Road, a manufacturer of motor-cars. It was agreed by Mr. Minton-Senhouse, barrister, that the petroleum found on the defendant's premises by the county council inspector was exempt from the licensing provisions of the Petroleum Acts, and was subject only to the rules and orders of the Secretary of State under the Locomotives on Highways Act, 1896, and that, therefore, the defendant did not require a licence from the county council to store petroleum for the purposes of his business. The magistrates took that view, but agreed to have a special case on the point of law, which was then raised for the first time, and which was regarded as equally important in the interests of public safety, on the one hand, and the requirements of the motor manufacturers, on the other. It now appeared that the matter had been taken up by the Motor Union, of which Mr. Napier was a member, and by the Automobile Club, and, in the absence of Mr. Minton-Senhouse, those bodies were represented by Mr. G. F. Emery, barrister, instructed by their solicitor, Mr. Staplee Firth. Mr. Paul Taylor invited the gentlemen representing the respondent to accompany Mr. Godfrey, representing the appellants, to the magistrate's private room, where he held a prolonged interview with them, and eventually settled the terms in which the case should be stated for the opinion of the High Court. There had apparently been some difficulty in the matter, as this was the last day but one allowed for the preliminaries of the appeal.

AN OBSTRUCTION CASE.

At the Bournemouth Borough Police-court, George Dorey, a motor-car driver, was summoned for preventing the free passage of the highway in the Christchurch Road, Bournemouth, on the evening of July 8th. Mr. Turner appeared for the prosecution, and Mr. C. Lamport for the defence. Walter Ireson, driver, employed by the Southbourne Omnibus Company, said that at about 9.30 p.m. on the evening of July 8th he was driving along the Christchurch Road in the direction of Bournemouth. He pulled up at the Derby Road to set down a passenger, and when he started again the defendant's car passed him. Witness was driving on the near side of the road, and when the defendant had got in front of him he stopped without any warning within three or four yards in front of his (witness's) horses, and set down some passengers. In the endeavour to avoid an accident witness pulled his horses up very sharply, but in doing so the middle horse of the team went down. The horse had broken its leg, and it had had to be shot. The Rev. Robert Boyd Morrison corroborated the evidence of the witnesses.

Mr. Lamport then addressed the Bench for the defence, and in doing so criticised the whole proceedings as being a case brought in that court to prejudice future litigation in a claim for compensation for the horse that fell down. He also pointed out that the summons was worded "unlawfully and wilfully did prevent, hinder, and interrupt the free passage

of a certain carriage," and he argued that there had been no evidence to show that there was anything wilfully done, and he submitted that, on the evidence of the prosecution, he was entitled to have the case dismissed. Some discussion ensued as to whether or not the summons had been taken out under the right section of the Act, and the Bench retired to consider the evidence. Upon their return, the Mayor said the Bench had considered the evidence in all its bearings, and had come to the conclusion that they must dismiss the case. Mr. Turner said that in that case he would ask that a fresh summons might be issued under Section 4 of the Act. Mr. Lamport asked the Bench to make an order as to costs, but this the Bench would not do.

FURIOUS DRIVING CASES.

At Daventry, W. A. Stevens, of Peckham, was summoned for driving a motor-car above the rate of fourteen miles an hour, at Weedon, on the 11th ult. The Rev. Henry Hughes Crawley, Stowe-Nine-Churches, stated that his man was driving witness from Weedon Station to Stowe at 2 p.m., when witness saw the motor-car coming down Stowe Hill at thirty miles an hour. Witness was not an expert, but the pace was tremendous, and he could not see the men for dust. The car was also on the wrong side of the road. Defendant said that he had a broken tire, and it would have been impossible to travel at that rate. He had driven a car for three years and had never been cautioned before. Fined £2 and 7s. 4d. costs.

At Stockport, George P. Cookson, of Old Trafford, was summoned for furiously driving a motor-car at Cheadle. Constable Bowden stated that defendant covered 220 yards in twenty-five seconds, which worked out at over eighteen miles an hour. The defendant said the car was only geared up to fifteen miles, and that speed could only be attained when everything was favourable. Going down hill he shut off the gas. Thomas Freeman, who was with the defendant, said the speed did not exceed twelve miles an hour. A fine of 10s. and costs was imposed.

At Southampton, Harry Gearing, of London, was summoned for furiously driving a motor-car in Winchester Road, Shirley, on the 17th ult. Defendant pleaded not guilty. P.C. Warden stated that the vehicle did the quarter mile in thirty seconds, being equivalent to thirty miles an hour. Defendant said the machine was only made to go twenty-five miles an hour. Fined 5s. and costs.

At Hastings, Philip Paddon was fined £1 and costs for furiously driving a motor-car on July 17th. The police said the car was going from fourteen to sixteen miles an hour, but the defendant said the speed was only twelve miles an hour.

At Kingston, Mr. T. Harveyson, the proprietor and driver of a four-hand coach running between London and Guildford, summoned Mrs. B. Weguelin, of Coombe End, for furiously driving a motor-car along the Portsmouth road to his "great annoyance and risk." Mrs. Weguelin disputed that she drove furiously or recklessly. She had driven a motor about 30,000 miles all over England, and never been complained of before. On this particular occasion she slowed down to less than twelve miles an hour as she was passing the coach. Mr. Harveyson was the only gentleman on the Portsmouth road who objected to her driving. Each time that she passed him he became very excited, leaning over the coach and waving his hat about, and once in his excitement he knocked off the hats of four of his passengers. Mr. Arthur Newton, for the defence, informed the Bench that before Mr. Harveyson applied for this summons one had been granted against him at Guildford for an alleged assault upon Mrs. Weguelin on the occasion of his demanding her name and address, which he had no right to do. The summons against Mrs. Weguelin was dismissed.

At Huntingdon Divisional Petty Sessions, Arthur James Robertson, of Peterborough, was charged with driving a motor-tricycle at a greater speed than twelve miles an hour at Brampton, on July 9th. Defendant pleaded guilty. P.C. Storey stated that he was near Brampton Hut at 2.26 p.m. on the day in question in company with P.C. Purser. They saw the defendant riding on a motor-tricycle coming from the direction of Buckden. The tricycle covered 750 yards in 80 secs., which was at the rate of nineteen miles 310 yards an hour. Defendant said he went at a slow pace through the inhabited parts of the country, but admitted that in the open country he went more than twelve miles an hour. The magistrates retired, and on their return into the Court the chairman said it must be clearly understood that the magistrates of the county of Huntingdon were determined to have the law carried out. The pace in this case was not so very excessive, and looking at all the circumstances of the case, they would only fine the defendant £1 and 3s. costs.

At the Aylesbury Petty Sessions on Saturday, the 27th ult., Mr. Noel Kenealey was summoned for driving his motor-car furiously to the danger of the lives and limbs of persons on the highway. The evidence on behalf of the police had been elaborately got up. One witness suggested that the three gentlemen on the car were disguised with masks in order to avoid detection. Evidence was also given by three cyclists, who were with a party of five, one of whom was knocked down and his machine smashed, and on whose behalf the proceedings were watched by a solicitor, apparently with a view to commence a civil action. The case was thrashed out at considerable length, and ultimately, after retiring to

consider their judgment, the Bench returned into court, and stated they had come to the unanimous conclusion that the case must be dismissed. Mr. Staplee Firth appeared for Mr. Kenealey, and conducted the defence.

It is stated that Tod Sloan, the American jockey, has entered for the forthcoming Erie to Buffalo automobile road race in the United States, and has ordered a special Mors car for the competition.

A CONFERENCE was held last week at the Automobile Club to consider the suggestion of the French Automobile Club that racing cars should be limited in weight to 1,000 kilograms. The result of the meeting was as follows: This conference recognises that the Committee of the Automobile Club of Great Britain and Ireland should consent to the proposal of the Automobile Club of France, that racing cars generally should be limited in weight to 1,000 kilograms. As regards the Gordon-Bennett race, however, there should be no limit, but the race should be run under the same rules as this year. The meeting was largely attended both by Club members and representatives of the trade, and the matter was fully discussed.

WE are pleased to be able to record that at last our military officers have decided to give automobiles a practical trial. During the last nine or ten days the Speedwell Motor-Car Company, of Reading, have been driving General Buller and his aide-de-camp during the manœuvres on Salisbury Plains, on a 5 h.p. Renault tonneau. The General expressed his entire satisfaction with its performance, both while on the country roads and on the Plains, as well as while visiting the Volunteers stationed at Aldershot. The car took the rough ground and the deep loose sands admirably. During the whole of the time, although the work was extremely rough, there was not a single mishap, breakdown, or adjustment required. The Speedwell Company also supplied a 10 h.p. Daimler brake to carry the General's servants and baggage.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, AUGUST 10, 1901.

[No. 127.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

SOME months ago General Sir Redvers Buller inquired of the Automobile Club whether he could hire a motor-vehicle for use during the Cavalry Manœuvres, and was informed that members of the Automobile Club were willing to place their vehicles at his disposal during the manœuvres. As a consequence, arrangements were made that Mr. Mark Mayhew, the vice-chairman of the Club, with his 7 h.p. Panhard, Mr. John Hargreaves, J.P., with his 12 h.p. Daimler, and Mr. J. Holder, with his 16 h.p. Napier, should be at the disposal of General Buller during the Cavalry Manœuvres which commenced on Monday, the 22nd ult., and continued throughout that week. Mr. Shrapnell Smith also arranged with Captain Lloyd, R.E., the Secretary of the War Office Committee on Military Transport, to take that gentleman during the manœuvres on his Ariel quadricycle, in order that he might have an opportunity of judging of the use of automobiles for Staff purposes, and as to the working of the three Thornycroft vans, and the Milnes petrol van, which were being used for transport purposes. Mr. Mark Mayhew was engaged for the greater part of the time in conveying Major-General Hemming, who was delighted with his automobile experiences. Mr. Hargreaves drove General Buller all day on the 24th July in spite of a terrific thunderstorm. The people in the villages turned out to see General Buller and cheered him heartily as he was driven along at twenty-five miles an hour. The drive was across Salisbury Plain, by lanes and cart tracks, General Buller being delighted with his experience. At other times Mr. Hargreaves was engaged in taking members of the Staff and in reconnaissance duties. The motor-vehicle was able to take scouts at high speeds to within a few yards of the top of a hill, drop them, allow them to advance on foot to the brow of the hill, and by this means to discover the enemy and return on an automobile to communicate their discovery in a very short period of time. The weather on the whole was very bad throughout the week.

More Military Exploits.

THERE seems to be no end to the favourable impressions which the motor-car is creating in the military mind. Fresh from their achievements during the cavalry manœuvres, motorists are winning unqualified praise by the manner in which they are assisting in the training of a large body of military cyclists at Aldershot. The Hon. C. S. Rolls and his Mors carry Major-General Douglas, who is in command of the wide field of operations. Other members of the staff are also conveyed by members of the Automobile Club, and on Wednesday Sir Redvers Buller followed the very trying march on a motor-car. Lateral communication between columns operating on parallel roads has also been maintained by motor-cars, important despatches have been carried at unheard-of speed, and scouting has been done in a creditable manner. The future of the cyclist as a separate arm is assured, as is the necessity of the motor-car to follow the lightly-equipped wheelmen with baggage and munitions of war, to say nothing of adding to the ubiquity of officers commanding their operations.

Sequel to a Summons.

As reported last week, a summons taken out by Mr. Harveyson, a coach driver, against Mrs. Weguelin, for driving a motor-car furiously along the Portsmouth road, was dismissed by the Kingstons Bench. It seems, however, that the incident was not to end at this. Mrs. Weguelin had suffered considerable indignity at the hands of the not too chivalrous exponent of the much regretted ways of our forefathers. On one occasion Mr. Harveyson went so far as to lay hands violently upon the fair automobilist whilst demanding her name and address. A summons was taken out for assault, but the coach driver had the good sense to apologise fully. Mrs. Weguelin, with commendable forbearance, accepted this, thus closing a truly painful incident of the Portsmouth road.

The Speed of Motor-Cars at Darlington.

MOTOR-CARS and the speed at which they travel along the country roads was one of the subjects discussed by the Darlington Rural District Council on Monday last. These cars have so far been allowed to run in the rural districts in a truly "reckless fashion," as Mr. John Feetham, J.P., described their method of travelling. But it is doubtful whether motorists will in the future stop to read a poster informing them of the nature of the statute in "such case made and provided," which the Darlington Rural Council propose to display for the benefit of the motor-car owners in the district, and who are alleged to have been seen riding about the country at the rate of thirty miles an hour. There was some reason in the suggestion that persons in motor-cars should be requested to ride slowly through the villages, but this did not find favour as against the motion of Mr. J. Feetham that posters should be issued. Henceforward the countryside will be spoiled by the posters warning motor-car drivers of the perils they run when driving at great speeds.

'Ware Essex

WHEN Mr. Courtland took his seat on the Bench at Halstead Petty Sessions the other day he delivered a short homily on motor-cars, which their drivers would do well to keep in mind before touring in that part of Essex. Mr. Courtland, the Chairman of the Bench, remarked that drivers occasionally went beyond the fixed limit of twelve miles an hour. One he was told passed his residence the other day at a speed which must have been fifty miles an hour. The Bench were agreed they would do all in their power to stop this practice, as when going at an excessive speed it was impossible for drivers to pull up in order to avoid knocking down children or infirm people who might be in the way. There was a difficulty about the matter, it was true, because some people said the police were not able to judge of the speed. He, however, did not see why a policeman should not be able to judge speed as well as anyone else, and the Bench must take their judgment. Another difficulty was that drivers of motor-cars who came from a distance did not care when a policeman called out to them, for they knew they could go faster than he could. There was one thing, however, went quicker than the motor-car, and that was a telegraph message,

and he suggested the police should avail themselves of this means, and at once wire on to the next town. He did not know whether the expense would be allowed by the County, but their own Bench would be happy to guarantee the police any such expense incurred.

Fruit Transport by Motor-Car.

It is not only in the south that experiments have this summer been made with motor-cars for the rapid conveyance of fruit from the nurseries to market. Messrs. Watson and Co., of Liverpool, inform us that during the recent strawberry season they carried successfully daily for three weeks in one of their cars a load of 360 baskets of strawberries direct from the fields at Farndon and Holt, where they were picked in the morning, to Liverpool, a distance of nearly thirty miles. The car arrived in Liverpool between eleven and twelve o'clock every morning, so that the public were able to buy strawberries which had been picked but a few hours previously. The fruit always arrived in splendid condition, and the experiment was so satisfactory that it is to be repeated next season.

Mr. W. M. Letts.

CONGRATULATIONS to Mr. William M. Letts, of the Locomobile Company of America, on his marriage, which took place on Tuesday last. There are not many motorists in the London district who do not know Mr. Letts, who has done much to popularise the light steam car in England. It was about two or three years ago that he came to the front in the

motor world, he at that time having charge of the business of the British Motor Coupé Company. Early in 1900 he went out to the United States, and during the time he was there made a tour of the various automobile works, devoting much attention to American motor-cars—both petrol and steam. Returning about six months later, he accepted the appointment as sale manager of the Locomobile Company, since which time over three hundred of these now well-known steamers have been sold in England.

Cheap Sites for Motor Tracks.

A SOMEWHAT original suggestion was made lately as to a method for obtaining the necessary land for the suggested motor road—namely, to buy up an old canal! There are many miles of useless canals in the country, some of them half or quite dry, the rights over which could be obtained for a mere song, and which could probably be converted into practicable automobile routes more cheaply than such could be obtained in any other way, while the necessary bridges, etc., would be already in existence; whether broad enough or high enough is another question. We remember seeing the proposal to convert them into high-speed electric railways in a work of fiction some years ago, but the more recent idea seems almost practicable

enough to be considered by automobilists, if Mr. Behr is not beforehand with them. The average width of a canal is from 30 to 50 feet and depth 5 feet, which are not unfavourable dimensions for the use suggested; while the comparative freedom from sharp bends, and the fact that the routes were designed to connect important centres, supply additional arguments for the idea.

Fast Driving.

THE Reading Automobile Club has issued a warning regarding fast driving, which, while intended specially for its members, is well worthy of the attention of automobilists generally. "We particularly wish to urge our members," state the committee of the R.A.C., "to exercise great moderation in the pace at which they negotiate the town thoroughfares in particular. Hitherto we have had no disagreements of this kind, and we should all extremely regret to see one of our members taxed with want of care and consideration. Unfortunately, quite recently, several complaints have been made to the Committee about the reckless driving of some of our members, and the complaints have come, not from biassed and prejudiced individuals, but from the police themselves, who, it is universally acknowledged, have treated us with unwonted fairness and courtesy. As these complaints are undoubtedly justifiable, they can only, if continued, have one result, and we appeal once more to all our drivers to exercise that moderation in pace which every other user of the road has a right to demand, and which sharply defines the difference between the gentleman and the common scorchers. We would have our readers remember that the seconds saved by fast driving in towns will about equal the number of months during which the prejudice they cause will live."

An Innocent Admission.

THE reluctance of police superintendents to stand cross-examination as to the instructions they give to their subordinates has been a conspicuous and amusing feature in many recent cases, but chance may elicit what the art and skill of the Bar does not always succeed in doing, as appears from a recent incident at Frimley. A cyclist, with some friends, was coasting down a hill in that picturesque neighbourhood, when he was stopped by a constable and cautioned against "scorching." A chat with the representative of the law elicited the naïve confession that he had been put there to catch Count —, whose big car has attracted some attention in the neighbourhood. The cyclist, we understand, has heard nothing further of the matter, such trivial catches being beneath police notice in the excitement of the chase after higher game. In all seriousness, however, the laxity of the force in their ordinary duties consequent on their attention being monopolised by official schemes of persecution is arousing some comment in several localities at the present time.

The Roads of England.

THE creation and maintenance of roads was last week the subject of a deputation to Mr. Walter Long, M.P., at the office of the Local Government Board. Mr. Robert Todd (the chairman of the Roads Improvement Association), who was the chief speaker, said the deputation represented the following bodies, in addition to his own association: The Cyclists' Touring Club, the National Cyclists' Union, the Automobile Club of Great Britain and Ireland, the Scottish Automobile Club, and the National Traction Engine Owners' and Users' Association. He said their opinion was that it was time some alteration was made in the present way of making and repairing roads. Cyclists had sprung up in thousands, and of late the country had aroused itself from its sleep in the matter of mechanical traction. The present roads were not large enough for all this new traffic. He asked the Government to take steps to carry out the recommendations of the Royal Commission on local taxation to make one half of the cost of the roads a national charge, conditional

upon efficiency. In reply, Mr. Long said he had listened with interest and some wonderment, for some of their proposals were of much greater magnitude than they seemed to think. The main question would be one of finance, and if they wanted to drive it home to the Government they must first overcome that difficulty. He himself travelled about a good deal, and he did not think he was prepared to accept the condition of the roads as they had been described. He did not hesitate to say that they had been enormously improved in the last twenty years, and he did not think the authorities deserved the blame which had been cast upon them. In any question of widening it must be first clear that sufficient cause existed, and then he was not quite certain that the ratepayers would provide the money for the purpose, while he did not think the State would provide even a small portion. He could not help thinking that sooner or later the growth of self-propelled traffic would require that special steps should be taken, but these would have to be largely at the cost of those who used these vehicles. He was bound to say that he had received many complaints as to those who used cycles and motor vehicles, and who made no contribution to the maintenance of the roads which they injured. Finally, he expressed his willingness to facilitate in any possible way the use of new means of transit. He would consider what had been said, and he asked the deputation to consider what he had said in reply.

Five Years Since 1896.

On August 15th, 1896, Sir David Salomons, president of the Self-Propelled Traffic Association, which is now merged into the Automobile Club, wrote to the papers expressing the gratitude of his Association to those who had helped the passage of the Locomotives on Highways Bill, 1896, into an Act, and urging motorists to act with prudence and consideration. Five years have nearly passed, and it must be recognised by all fair-minded people that automobilists have justified the adoption of that measure. There have been none of the murders on the highways that were predicted if motor-cars were not made to crawl behind the red flag; and altogether the position is very satisfactory to those who, like Sir David Salomons, spent long nights and days in convincing legislators that motorists were not more terrible than other human beings.

The Press and Automobillism.

AUTOMOBILISM has been a boon to the press. The mishaps of motor-cars have filled many a corner, and the demonstrations of the Club, the exhibition, and the letters from prejudiced opponents and enthusiastic supporters of the automobile, have provided column after column of good reading. When a provincial paper is hard up for matter it generally secures a motor-car ride for a representative, and then the column comes along without difficulty. Most of these journalists, who profess to start with fear and trepidation, return thoroughly converted to the pleasures of the motor-car. There is scarcely a provincial journal of any standing which has not published such an article during the summer.

Another Conversion

WHERE newspaper scribes are inclined to show an antipathy to automobiles, motorists should endeavour to see to their education. A writer in the *Surrey Comet* recently thought fit to lecture the drivers of the many motor-cars passing through Kingston. The result was a call from Mr. Montague Grahame-White, who challenged the erring journalist to a practical demonstration. The scribbler mounted the car, which soon attained a pace that "made tears stream from the eyes," but he confessed "the sensation was a very delightful one"—an impression which all who try the new means of locomotion gather; hence the growing popularity of the motor-car.

Dirty Streets.

AT a time when scientists are discussing the ravages of consumption and attributing its prevalence to the wretched spitting habits of many individuals among our millions, we may be pardoned for suggesting that the effect of horses on the public health of our great cities might well be considered. They are mainly responsible for the dirt of our streets, and we have it on the authority of Mr. T. Blashill, F.R.I.B.A., the late superintending architect to the London County Council, that all other materials in the roadway are of small account "compared with the great bulk, which was simply from horses, worked up by wheels into slush in wet weather and ground into dust in dry." This is a point which should be remembered by those who are disposed to thwart the progress of the automobile. Not only will the general introduction of the motor-car into great cities facilitate rapid transit from one locality to another and ease the congested character of the public thoroughfares, but it will prove one of the greatest aids that sanitary science has received for at least a decade.

Motor-Cars to the Rescue.

IN our last issue we referred to the good work done by motor-cars during the recent heat wave in New York in conveying people prostrated by the heat to the hospitals. That the authorities of the latter fully appreciated the services is clear from the following extract of a letter sent by the Superintendent of the Roosevelt Hospital to the Locomobile Company,

7 AUTOMOBILE SNAPSHOTS FROM AMERICA.—AT WILLETT'S POINT, LONG ISLAND. [Automobile Magazine.]

of America:—On behalf of the Trustees of this hospital I wish to express to you their grateful acknowledgment of the very valuable assistance rendered the institution by your company on the occasion of the period of excessive heat with which this city was afflicted during Tuesday and Wednesday, July 2nd and 3rd. The hot spell of that time rivalled that of the year 1896, when, for the first time in the history of the hospital, it became needful to not only secure the assistance of the patrol wagons of the police department in bringing cases of heat prostration to the institution, but to impress grocery wagons and delivery vehicles of various kinds into the service for a similar purpose. The necessity for doing so on the recent occasion was happily obviated by the very generous response made by your company for the use of surreys and the further offer of the New York Electric Transportation Company, to place at the disposal of the hospital such of its vehicles as were required to enable the institution to effectively perform the work of its ambulance service. The work done by the "Locomobiles" was really a marvel. I was informed that one of your surreys brought in thirty-seven patients on the first day of the hot spell. Such a record could not be equalled by one of our horse-drawn ambulances.

The Storage of Petrol.

AN American motorist sends some interesting particulars to a transatlantic contemporary of a means he has adopted of storing petroleum spirit: "I procured a strong galvanised iron tank having a capacity of 120 gallons. Into one side of this I inserted three pipes; one an inch and a quarter in diameter, through which, by means of a funnel and an ordinary oil pump, the petrol is drawn from the barrel and conveyed into the tank. Near this is a small quarter-inch pipe. Then a three-quarters inch pipe extending down within half an inch of the bottom of the tank. All three of these pipes are screwed in, and made secure against leakage under pressure, and each has a globe valve selected and tested with care to make sure that it is perfect and will not leak under pressure. I then buried this tank about eighteen inches under ground in front of my stable, the afore-said pipes being long enough to extend up six or eight inches above the surface. A piece of rubber hose is attached to the three-quarter inch petrol pipe, and a box with hinged cover on top, with hasp and staple for lock, encloses all these pipes. Into this tank I put two barrels (something over a hundred gallons) of petrol at one filling. When I wish to draw out petrol, I simply attach an ordinary bicycle pump to the air pipe and force air into the tank until the petrol runs out. This is quickly and easily done, and the entire arrangement is found to be both a safe and convenient way of storing petrol, and is secure against a possibility of waste by evaporation, provided the valves are kept closed when not in use, and the enclosing box kept securely locked."

AUTOMOBILE SNAPSHOTS FROM AMERICA.—BEGINNING OF JERICHO PIKE, LONG ISLAND. [Automobile Magazine.]

A New Danger.

IN view of the recent unfortunate accident at Messrs. Carless, Capel, and Leonard's Works, at Hackney Wick, a word of warning given on the subject is of especial interest. At the inquest this week the chief officer of the County Council Public Control Department, Mr. Alfred Spencer, considered that the safest way to store spirit was by underground tanks, as insisted on by the County Council. He added, however, that the flood which was the cause of the accident disclosed a new danger with the storage of spirit, and that the danger of flooding sunk tanks would have to be met and guarded against.

A MOTORIST was recently compensating the mother of a boy whom he had knocked down and injured with his motor-car by giving her half a sovereign, when he was seized by a policeman and charged with having been drunk whilst in charge of the car. To this charge he had to answer at the City Police Court the next day, and, though he repudiated the statement that he was drunk, the Bench fined him the maximum sum of 40s. and costs.

DERBY TO YARMOUTH ON A WERNER BICYCLE.

SEEING a letter of Mr. A. L. Benett's in a recent issue of the *Journal*, describing a very good run on his Werner, I thought it might be of interest to many to know what can be accomplished on a motor-bicycle. On Saturday, June 29th, I started from Derby at 6 a.m. for Yarmouth, riding through Nottingham, Grantham, and Spalding, arriving at King's Lynn, ninety miles, at 12 p.m. Making a rest there of three hours, and after a good lunch at the Duke's Head, I left at 3 o'clock, passing through Swaffham, Dereham, and Norwich, arriving at Yarmouth at 7 o'clock in the evening, my counter registering 166 miles. The only trouble I had was near Norwich, when the engine began making loud explosions. On examination I found the platinum tip had come off the trembler. Having a spare one, this was very soon put right. On Sunday, after breakfast, I rode all over the town, leaving there at 10.30 for Cromer, where I arrived at 12 o'clock after a splendid run on very good roads. After looking round the place for two hours, I started for Hunstanton, through Sheringham, Blakeney, and Wells, arriving at 7 o'clock, the only trouble being a puncture in the back wheel near Blakeney, which caused a long delay, for, after mending the puncture and on getting on again, the cover blew off and made a big burst, a hole three inches long. Leaving the machine at a fisherman's cottage, I walked backed to the village, three-quarters of a mile away, to find a bicycle repairer. He happened to be in chapel, causing me half an hour's wait. He turned out to be the village boot-mender, and a very obliging fellow he was. He had some prepared rubber sheeting, and I was soon put right again and on the way to Hunstanton, where I arrived at 7 o'clock, eighty-three miles run, and put up for the night.

The next morning was very black, and heavy rain had fallen in the night. I started at 10.30 for Lynn. After riding about six miles the rain began to descend, and through the Sandringham district it came down in torrents. However, the motor still went on, and I got into Lynn about 12 o'clock, and called on Mr. Morris, who kindly lent me the use of his bath-room and a new pair of dry stockings and leggings. As the rain continued, I put the machine in the train and returned home. Here is where the motor-bicycle comes in—it only cost 4s. to Derby.

At Derby Station I got on the machine, and it went off right away, after its thorough wetting. There was a very strong head wind all the way to Yarmouth, and this caused my main tank to give out at sixty-six miles instead of eighty. In one case the Werner has run eighty miles on one tank, and in another case eighty-three miles. I have now run the machine 1,300 miles, and have had practically no trouble.

J. SIMKISS.

It is reported that Charron has sold the racing car he used in the Paris-Berlin contest for £3,200.

It is but a little while since the motor-car was of a clumsy and primitive character, handled only by a few enthusiasts and regarded rather as a curious toy than as a vehicle promising much usefulness. Now it is familiar everywhere; the work of the construction has become an important industry; it is used for business as well as pleasure, and the prospect of its wide employment exceedingly promising.

THE British Automobile Commercial Syndicate, of 97 and 98, Long Acre, has just put in a large hydraulic lift, which communicates between the four floors used as show rooms. A well equipped workshop has also been established on the top floor, where repairs of all kinds can speedily be effected. The Syndicate have just received the large Mors car in which the Hon. Evelyn Fitzgerald and Lady Rosslyn met with an accident recently. The car is in a fearfully smashed condition and will take from six weeks to two months to repair. It speaks well for the repair department of the Syndicate that they are able to undertake such a work.

END TO END ON A STIRLING PARISIAN PHAETON.

ON Friday, July 26th, I decided to run over what I believed to be the most trying course for a vehicle of any description—namely, John o' Groat's House to Land's End—in order to put to the test a light motor-car which my company is placing on the market, and which will be known as the "Stirling Parisian" phaeton. Next day a stock car was oiled up and despatched by train to Wick, where I followed it on Monday morning, after telephoning Messrs. Peter Lee and Sons, High Street, Glasgow, to have a supply of petrol for me at Perth and Carlisle. After an early breakfast on Tuesday (July 30th), John o' Groat's was left behind in a morning mist. The roads had a thick coating of dust, for rain had not fallen there as it had done the previous day in the south. The surface was far from good, being covered in many places with loose stones. Especially was this the case on the dangerous hills at Dunbeith and Berriedale, the latter having a gradient of 1 in 9. At Mound Station a wrong turn was taken, which sent us round by Lairg Hotel on our way to Bonar Bridge, adding ten or twelve miles to the journey to Tain, which was reached in time for lunch. Thereafter we drove on through Dingwall and Beaulie to Inverness, which was reached at six. Passing through Dingwall rain began to fall heavily, and continued until within ten miles from Inverness. After dinner, the weather looking more settled, it was decided to continue the journey, and a start was made at eight o'clock. The city had scarcely been cleared when the rain again made its appearance, and for the next fifteen miles we had literally to plough our way through soft, spongy clay and mud of a dangerously greasy sort. The low gear was inevitable if the car was to be kept parallel with the road; only occasionally was the high gear slipped in when the road surface became harder. Darkness coming on, and neither the roads nor the weather improving, it was decided to stop for the night at Freeburn Inn, 181 miles having been covered during the day.

Leaving Freeburn at 7.30 a.m. on Wednesday, we travelled well over roads still wet and having some stiff gradients, on through Kingussie and over the Grampians, the summit of the road being 1,500 ft. above sea-level. A fine run down the other side was obtained in spite of the loose state of the road. The crawling pace of a train just here on the Highland line, drawn by two powerful engines, gave us a reminder of the steepness of the grade. Some time before the summit was reached the sky was clearing, and by and by the sun shone out brilliantly and continued with us as we quickly and in succession passed through Blair Athole, Killiecrankie, Pitlochry, Dunkeld, and into the fair city of Perth for lunch at the Station Hotel. The petrol store was renewed here, and at about 3.30 a start was made for Edinburgh. Burntisland was reached about six and the Granton Ferry crossed at 6.30. We reached the Royal Hotel, Princes Street, Edinburgh, shortly after seven and in time to keep an appointment at 7.30. During the last two hours rain had fallen plentifully, and Princes Street was almost deserted when we turned into it after the long steep climb up Pitt Street. Distance for the day, 140 miles.

Edinburgh was left next morning at five o'clock. The rain had ceased but the roads were heavy in places. Conditions, however, improved as Biggar and Abington were passed, the fine Glasgow and Carlisle road being struck at the latter place. After passing through Crawford and Elvinstown the ascent to Beattock was commenced, followed by a flight down the gentle slopes on the south side. The road continued good through Lockerbie, and Carlisle was reached at 10.50, the run of 98½ miles having been done on one charge of the petrol tank, which holds 21.5 gallons. After a good meal and replenishing the oil tanks, Carlisle was left about 12.30. A few miles out we met what appeared to be a Wolseley car making its way north. The road over Shap Fells was in fair condition, and it was only necessary to get down to the low gear on nearing the summit, the rest being easily surmounted on the second speed. Weather and roads

continued fine through Kendal, Milnthorpe, Carnforth, and Lancaster, but rain and wet greasy roads were again encountered ten miles out of Preston, the stopping place for the night. Run for the day, 186½ miles.

Leaving Preston after an early breakfast on Friday, having had the tanks refilled the previous evening, we travelled by Wigan and Warrington, after which the road was somewhat difficult to find, being without the strip map by Gall and Inglis for this portion of the route. The road taken was through Northwich, Sandbach, Stafford, and, as I had an appointment to keep in Birmingham, the road through Walsall, instead of the more direct route, was followed. After a stay of 45 minutes we passed on to Bromsgrove, where a late lunch was partaken of and the car oiled up. Good running was made through Worcester on to Gloucester, and thereafter to Bristol, which was reached shortly after nine, putting up at the Royal Hotel.

Making an early start on Saturday morning, the last lap of the journey was entered upon. Some trouble was experienced in getting on to the right road out of Bristol, we going several miles out of our way through misdirection. After Bristol the roads were not of the best, and further south, where traction-engine work is common, they were badly cut up. They, however, improved considerably as Bridgwater was approached. We stopped to shake hands with Mr. Roberts, coachbuilder, who is an enthusiastic motorist, and, in addition to his own business, undertakes the overhaul of motor-cars of every description. Although it was our intention to spend only a few minutes here

JOHN O'GROAT'S.

LAND'S END.

we found an hour and a half had been absorbed in looking over Mr. Roberts's well-equipped works and showrooms. The roads were excellent to Taunton and fair to Exeter. Leaving Exeter a sharp thunderstorm was experienced, and we had to face two hours of heavy rain as the Devonshire hills, some of which are as trying as those in the far North of Scotland, were climbed. The weather thereafter cleared and, although the roads were heavy, no more rain was encountered on the journey. The route now lay through Launceston and Wadebridge to Truro. After supper the journey was continued on to Penzance, where most good people were evidently asleep, and after leaving the well lighted streets we plunged into the blackness and darkness of the road out to "the end." The good folks of the house had turned in, but very quickly "turned out" on hearing the sound of our car, and received us with every hospitality, and thus the long journey was ended. Distance for the day, 199½ miles. During the whole journey of 900 miles not a bolt or nut worked loose. The travelling time of the trip was 59¼ hours, and the petrol consumed twenty-eight gallons. The motor required attention only on one occasion; this was at Tain, where the engine did not start up briskly and we washed out the inlet valve, in which we found a little grit. Although the car is fitted with both tube and electric ignition, only the latter was used. The sparking plug was never cleaned or even taken out for examination until a few miles south of Launceston, when a few misfires

were for the first time observed. This was after 817 miles had been covered. On inspection, the plug was found "sooty" but otherwise in perfect condition. The cooling water used was four gallons. A word should be said of the tires, which were Dunlops. They went through the entire journey without a puncture, and were not even reinflated once by the way.

JOHN STIRLING.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE lunches at the A.C.F. Club House in Paris seem to be becoming more and more popular; it was most difficult to get a place the other day, in spite of the season being over. I noticed one of the Mors brothers, who confirmed the fact that his firm have been inundated with orders since his success in Berlin. I also noticed M. Falconnet, M. Cuenod, the President of the Swiss Club, and many other familiar faces.

WHILST driving through the Bois de Boulogne I met Captain Laycock and Fournier in a dark green car with a large tonneau body, the whole looking very newly painted, and seeming to have no resemblance to the dusty, oily racing car which I had last seen as it was steered victoriously by Fournier to the winning post on the Berlin racecourse. On making inquiries from M. Mors, however, I was informed that this was the famous car just out from the carriage-builders' hands. I learned, further, that Captain Laycock had paid a visit to M. Santos-Dumont to make inquiries as to the cost of a navigable balloon, so that it is just possible that this first-class sportsman may come sailing over the Channel shortly with aerial navigation added to his other pastimes.

MAJOR KREBS, of the Panhard and Levassor, will, it is reported, shortly produce a new petrol motor of such extraordinary lightness that the weight per horse-power will be only 5 kilogrammes. As Major Krebs formerly worked with the brothers Renard, the motor, it is believed, is intended for aerial navigation purposes.

A MOTOR-CAR to run on a railway is a seeming paradox. A French railway company is, however, giving the matter serious consideration, and has built several vehicles of a new type. Each of these is practically an entire railway train on a small scale. The same vehicle contains the engine, compartments of three different classes, a luggage and a guard's van, the total length being about 88½ feet. The engine is a steam motor of 125 h.p., capable of propelling the vehicle at an average speed of some thirty-eight miles an hour with its full complement of eighty passengers. The peculiarity of the new railway motor-car is that the engine room is in the middle. The driver stands on a box raised sufficiently above the roof of the rest of the vehicle to allow of his obtaining a full view of the line, front and back, and can drive the car either way. The Northern Company is experimenting with the new vehicles on the line to Pontoise, and contemplates eventually putting them into general use for the local service on its Paris suburban system, in preference to the ordinary trains, as a considerable saving of expense will, it is estimated, thus be realised.

AN exemplary punishment has been meted out by the Correctional Court to a French motorist who knocked down a foot-passenger while driving a car in the Avenue de la Grande Armée, Paris, with fatal results. The automobilist pleaded that the accident was due to the rashness of the deceased in crossing just in front of the car. While not entirely rejecting this explanation, the Court, nevertheless, sentenced the motorist to two months' imprisonment, ordering him to pay £2,400 damages to the widow of the dead man.

VARIOUS localities have been suggested by French automobilists as suitable for the construction of motor-drômes on a large scale, but all have up to the present proved on investigation

to be possessed of disadvantages, such as remoteness from Paris or too flat a surface, which more than outweigh considerations of low price. A more promising site has, however, recently been suggested. Report has it that the Duke of Parma is willing to reserve for motor-racing a private carriage-drive, twenty miles in circumference, which runs round the superb park of the famous castle of Chambord. Moreover, that on occasions when races are held there grand fêtes would be given in the Château. The road itself is described as admirably fitted for the purpose to which the Duke of Parma is believed to be willing to devote it. All that would be required, the advocates of the scheme say, would be to create a few artificial hills, and to increase slightly the gradients already existing.

THE Motor Club of Lyons held a series of kilomètre speed contests with flying start a few days ago, but no new records were set up. In the class for cars of over 20 h.p., Deydier was first on a 24 h.p. Audibert-Lavirotte car in 1min. 7sec. Rivat was the winner in the class for cars of from 8 to 12 h.p., he covering the kilomètre on a 12 h.p. Panhard in 1min. 3sec. In the category for motor-cycles of over 3 h.p., Germain on a 6 h.p. tricycle covered the kilomètre in 46½sec.

THE THOMAS UNIVERSAL-JOINT PROTECTOR.

THE universal joints employed on cars of the Renault and Darracq type have so far been open to the double disadvantage of requiring unsightly and ineffective leather washers, not too well adjusted, and thus open to the entry of dust and mud. M. G. Thomas, of Agen, France, whose name is associated with more than one invention for motor-cars, has

FIGS. 1 AND 2.

recently brought out another ingenious little contrivance for the covering of universal joints, of whatever form, which combines the advantages of simplicity, elegance, and interchangeability. The device, which is both dust and watertight, consists of one rigid piece of metal, box-shaped and nickel plated, which fits to

FIG. 3.

the fixed parts of the joint, and into which is inserted a pliable or elastic piece of leather, india-rubber, or felt, hidden in the rigid piece in such a manner that the movable piece of the joint retains the freedom of its movement, yet is hermetically sealed against all exterior and detrimental agents. A general view of the protector is given in Fig. 1, while Figs. 2 and 3 show details.

BELT v. GEAR.

THE ADVANTAGES AND DISADVANTAGES OF BOTH SYSTEMS.

TO the prospective purchaser the first serious question will be, "Shall I buy a belt or gear driven car?" As there is something to be said for each system, the writer will just touch upon the most important points.

Belt-Driving.—Belt-driving may be divided into two divisions—(a) fast and loose pulleys, (b) jockey pulley. The first of these is the commonest, and, speaking generally, the most satisfactory; in the second, where a jockey-pulley is employed to tighten the belt, care must be taken about changing speeds or broken belts will inevitably result. There are also cars where belt and gear are employed, and these will be discussed later. The advantages of belt-driving are—(1) it is practically noiseless, (2) ease of manipulation and general simplicity. The disadvantages of belt-driving are—(1) the belts are liable to slip, (2) or break, since in a large number of cars offered to the public the belts are of insufficient width for the power they transmit. Referring to the above-mentioned advantages, noiselessness is a great point in favour of a car. As regards manipulation, most of the readers of the *Journal* are probably aware how extremely simple it is to change speed on a Benz car. The above are really the only two advantages which can be claimed for the belt-driver; and now as to the disadvantages. Belts slip. In wet weather leather belts are simply wicked in this respect, unless they are very adequately protected; and when a belt really does slip the only satisfactory method of preventing this is to cut a piece out, which is a truly delightful job to perform on the road with the rain pouring down. They break—well, one is not surprised to see that a belt breaks when it has to transmit a good deal more power than it is intended to. A belt to transmit, say, $4\frac{1}{2}$ h.p. should not be less than three inches broad. The slipping tendency of belts depends largely on the material the belt is made of. A very satisfactory belt will be found in Dick's belting. This belt grips at a much lower tension than most, and consequently there is less loss of power. If a belt-driven car is to be satisfactory, it must not weigh more than 6 or 7 cwt., the belts must be adequately protected, and of a suitable size for their work.

Belt and gear driven cars.—These may be divided into two divisions—(1) where the belt takes the place of the clutch and takes the drive from the engine to the gear box; (2) where the central of three pulleys is loose, the other two being in gear with the back axle through different sized spur wheels. For the former there is really very little to be said—perhaps there is less chance of damage to the gear, as if the speed is changed without throwing off the belt it will probably slip and thus save the teeth of the gear wheels. The latter system is extremely simple, as the changing simply consists of pulling a small handle into one of three positions, the middle one being the out of gear position. This system is very successfully used on the New Orleans, Pieper, Sports, Simplex, and other cars. Of course in this system, as in the others, the belt should be properly protected.

Gear-driven cars.—People very often assert that a gear-driven car is very noisy. So it is, sometimes. But does all the noise come from the gear? The writer is very nearly certain that in cars like the M.M.C. voiturette, York, and others a considerable share of the racket is accounted for by the high-speed engine. Take the Daimler car, for instance; its normal speed is about 850 revolutions; this car is noisy, but nothing out of the way, on the low speed up hill, and what car is not? It is comparatively silent, however, on the fourth speed. Another source of noise lies in the fact that a good many car owners fail to look after their gear properly. The gear-driven car is an all-weather car, and in that is an inestimable advantage. Clutches, it is true, do slip, but not if they are properly constructed and the tension spring or springs properly looked after. The best gear is, in the writer's opinion, the Panhard. Changing speed is more or less of an art; it is soon learned, however, and once acquired is not forgotten. There are several systems of gear-driving:—(1) The Panhard;

(2) improved (3) Panhard; (3) clutches. Everyone is probably familiar with the Panhard gear, so the writer will not discuss it. As to the improved pattern, it is questionable whether it is an improvement. The wheels are always in mesh, and locked to the axle by a sliding key; this, to the writer, seems a wasteful type of gear, owing to the number of idle gears. Sometimes, also, they do not change readily. Gearing by clutches is similar to the last named, only clutches are employed to lock the wheels. This type of gear is extremely simple to operate.

In conclusion, the writer hopes that he has made the various points clear, and that the prospective purchaser may not be any longer in perplexity. C. A. R.

A NEW NON-FLOAT FEED CARBURETTOR.

ONE of the novelties at the recent exhibition at the Agricultural Hall was a new non-float feed carburettor, which is being introduced into this country by Autocar Supplies, Limited, 66, Great Russell Street, London, W.C., and of

FIGS. 1 AND 2.

which we are now able to give illustrations. The petrol enters the carburettor at 20 from a higher level (the reservoir), and is regulated by the tap 17, which is grooved at 18, and connected to a governing handle. The air enters at 8, and the amount once regulated by the slide 3 requires no further attention. The suction of the motor causes the petrol to gush up through 13 and against the fans 5 and 6, which revolve in opposite

FIG. 3.

directions. The spirit, thus vaporised and mixed with air, passes to the explosion chamber of the motor through the opening 7, through metallic sieves, which have the effect of keeping back any spirit which may not have been thoroughly vaporised. A small overflow hole 23 prevents the flooding of the carburettor in case the tap 17 should not be shut. A heating chamber is provided at 11, this being connected by a curved pipe to the exhaust.

M. SANTOS-DUMONT AND HIS NAVIGABLE BALLOON.

BY AUTOMAN.

CROWDS of people are trooping out daily to Suresnes in anticipation of seeing M. Santos-Dumont take a trip in his navigable balloon. Not only are the grounds of the Aero Club black with visitors, but the hills and bridges and any point of vantage in the neighbourhood are also lined with spectators. Particularly noticeable amongst those who visit the

THE SANTOS-DUMONT NAVIGABLE BALLOON AT LONGCHAMPS.

Aero Club are many well-known automobilists. I saw the Marquis De Dion, M. Serpollet and his wife, Captain Laycock, Fournier, and many others, all of whom expressed their admiration for the perseverance of M. Santos-Dumont, who has done so much to solve the problem of aerial navigation. The balloon and all the apparatus are so simple that the first thought that strikes everyone is, Why has it not been done before? As to the balloon it is cigar-shaped, about twenty metres long, and containing 550 cubic metres of hydrogen gas. To this is suspended by means of cords and piano wires a sort of light triangular keel, made of three strips of wood bound together by cross stays and coming to a point at each end, the weight being about a cwt. In this keel a 16 h.p. four-cylinder Buchet air-cooled motor is fixed; in connection with the engine is a long shaft projecting out past the pointed end of the keel, and having at its termination a screw propeller, very much like the ordinary propeller of a steamship, but four metres in diameter and made of wood and silk; this is the stern of the keel. Towards the bows there is a basket in which the navigator stands, and near which are attached all the necessary cords for manœuvring the whole apparatus. Between the keel and the balloon at the stern end a rudder is suspended, which, being made of silk stretched on a wooden frame, very much resembles a sail. The cords from this rudder pass forward along the balloon and descend to the steering wheel just in front of the basket, and by the side of which is fixed, not a compass as in ships' navigation, but a barometer to show at what height the balloon is. A clutch is introduced between the engine and the propeller shaft by means of which the propeller can either be stopped or started without stopping the engine. Curiously enough, the clutch is kept out of gear by the elastic part of one of Sandow's chest expanders. It has been said and repeated in nearly every paper which has commented on the subject that the machine is lighter than the air. This, however, is a mistake. I have it from M. Santos-Dumont himself, that when ready to take flight, the machine, ballast and occupant weigh some thirty pounds more than the air, and therefore, rest on the ground until the propeller is put in motion; the power produced by the propeller turning against the air overcomes this thirty pounds and gives a push of an additional twenty pounds as far as he can estimate.

To understand the principle that M. Santos-Dumont has established readers of the *Journal* must imagine the balloon already in the air, and in a horizontal position. The navigator has, however, a movable weight, which is movable in the direction of the length of the machine. If he wishes to travel horizontally he puts the weight in such a position that the balloon will be horizontal to the earth's surface. Should he wish to rise, the weight is drawn backwards towards the stern, so that the bows of the air-ship point upwards. Should he desire to descend, the weight is run forward and the bows promptly point downwards. To the uninitiated this may seem comparatively unimportant and a little explanation is therefore necessary. When an ordinary balloon is sent up it is of course much lighter than the air, and would continue ascending indefinitely if it were not stopped at a desired altitude, by the opening of the valve to let out the hydrogen; the balloon then begins to descend. As it is quite impossible to balance it accurately in the air, and as the hydrogen condenses slightly and loses its pressure, the balloon then takes a descending course, and to stop it descending it is necessary to throw out ballast, when the balloon begins to reascend and the same process has to be constantly repeated. Each time the distance between the points of change of direction becomes greater, until finally all the ballast has been thrown out and the balloon has to redescend to earth by means of the escape of hydrogen. All this limits the time in which a balloon can be maintained in the air, and renders it impracticable for travelling purposes. It will be remembered, however, that M. Santos-Dumont makes his balloon ascend or descend simply by means of the propeller and balance weight, and loses practically no hydrogen, so that the time he can remain in the air depends upon the amount of petrol he can carry to keep his engine working. In his own words he has already been up in the air for 4½ hours, without throwing out any ballast or losing any gas, and maintaining the whole time a height of 300 yards; this, too, in the morning when the sun was gaining force, and therefore expanding his hydrogen. M. Santos-Dumont gave me all these details at his beautiful home on the Champs Elysées, where I found him, accompanied by his faithful henchman, M. Emmanuel Aimé, busy opening letters of congratulation. He is quite a young man, being only twenty-eight years of age, and the son of a rich Brazilian coffee planter. He went to Paris some five or six years ago with a fixed idea of making a flying-machine. This is the fifth which he has made since then, all of which without exception have been successfully navigated by him,

THE BALLOON CROSSING THE SEINE AT 4.30 A.M., JULY 29.

though not, of course, nearly as successful as the present one. "It is not a question of invention," said M. Santos-Dumont, "but of careful progressive experiment, and now that I am able to actually experiment in the air, I shall be able to learn all its secrets. My balloon is a combination of the balloon and the aeroplane: the cigar shape of the envelope gives it a tendency to float in the air. Since I have made my successful flights, I have

received many offers from engine builders prepared to make me motors far lighter than the one I am employing, and I have no hesitation in saying that as far as use in war is concerned, I am ready. You can imagine how convenient it would be to take a flight in one of my machines over the enemy's territory and see the exact disposition of his forces. Then, again, if aerial navigation is a success, and I see no reason why it should not be, the actual authors of a war will be themselves in personal danger, for nothing would be easier than to send a flying machine to hover over a palace and drop a bomb on the originator of a conflict." "But what about the wind?" I asked. "The wind," said M. Santos-Dumont, "is a great difficulty; but then you must not forget that the wind is only in layers, so to speak. If you send up twenty-five balloons in the same spot at the same time, no two of them will be blown in the same direction, and therefore I have only to ascend or descend to find a favourable wind. The dew, however, is the great enemy of the flying machine. Imagine the whole surface of my balloon being wet with heavy dew. It would make a difference of more than a cwt. and bring me down. I shall, of course, continue my experiments, though I do not claim any great invention. Still, I have been the first to use the petrol engine, and I well remember how I was ridiculed when I suggested applying a petrol engine so near to a mass of hydrogen gas. I was the first, too, to use piano wires for the suspension of the keel, and this is a great advantage from the point of view of weight and of resistance to the air."

AN automobile club has just been formed at Liepzig, Germany.

MR. C. J. FIELD, of the De Dion-Bouton Motorette Company, New York, has, it is stated, ordered a 24 h.p. Napier car.

THE City Council of Rochester, N.Y., has passed an ordinance limiting the speed of automobiles to six miles per hour within a radius of one mile from the centre of the city.

MR. CHARLES G. WRIDGWAY, who is well known in this country, and who has been connected with the De Dion-Bouton Motorette Company of New York for the last eighteen months, is now the assistant general director of the company, he coming next to Mr. Cornelius J. Field, vice-president and general manager. Those who are acquainted with Mr. Wridgway will congratulate him on his advancement.

THE American Bicycle Company, who recently purchased from Messrs. Julius Harvey and Co., 11, Queen Victoria Street, London, E.C., an English-made steam-motor van, have now decided to build heavy cars, and have, we understand, just put in hand a dozen large motor-wagons. Messrs. Harvey, in addition to some good orders for motor-wagons, have just shipped to the East a mile of portable railway, with trucks, etc., and a steam road roller for the Government of Perak, which latter, although not a racer or motor within the meaning of the Act, certainly comes under the head of self-propelled vehicles.

THE Steel Cushioned Hub Company, of Worcester, Mass., are the makers of a new hub for automobiles and other vehicles which they call the Steel Cushioned Hub. It consists of a hub shell with flanges a little larger than the ordinary, which is engaged by a cone that takes hold by means of a clutch. This cone acts on another inner cone, which acts on a strong spiral steel spring encircling the axle. The hub proper never comes into contact with the axle. It is claimed that the device relieves the axle from the shocks due to bumpy roads and obstructions.

THE Duryea Co., of Reading, Pa., U.S.A., are using a special form of lock-nut in their motor-cars. It consists of a nut provided with two or more prongs projecting parallel to the bolt and adapted to be held from rotation by a cotter-pin placed through the bolt. This construction permits a half, quarter, or sixth turn of the nut (depending upon the number of prongs) to be made when adjustment is necessary, after which the cotter-pin may be replaced and further movement in either direction is impossible. The company state that they have used many forms of safety devices in the past ten years, and that this one meets the conditions more fully than any other.

CORRESPONDENCE.

GREASE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In response to Mr. Frank Apperley's complaint, I have exactly the same experience of the grease wasting through the bearings of the gear box of my Darracq. I am at present trying Wm. Lea's, of Berry Street, Liverpool, grease, and so far I find it has a silencing effect on the gear, and think it is a good thing, but it will have to be greatly reduced in price if taken up generally.—Yours truly,

F. COOP.

AERIAL NAVIGATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The interesting letter by Sir David Salomons in your last issue opens up a wide field for careful thought, for unquestionably M. Santos Dumont has furnished a valuable contribution to aerial navigation, whether we accept the proposition that the future air-ship will consist wholly or in part of a balloon or not.

As a very humble student and experimenter in this fascinating branch of engineering, may I solicit the favour of a little of your valuable space for a few remarks thereon, which, although necessarily rather incoherent and scattered, yet may perhaps assist others who, like myself, have endeavoured to solve the knotty problem, and in a slight degree supplement Sir David's able remarks thereon?

It is no doubt superfluous to ask the question, but has Sir David access to the back volumes of that well-known store of information, *The Mechanics' Magazine*? If so, he will find an illustrated description of Mr. Henson's flying machine, which was, considering the times, a clever attempt to press the steam engine into service with a special boiler and an air-cooled condenser. The scheme failed, I believe, through the boiler, but in many respects it foreshadowed Sir H. Maxim's steam aeroplane.

Much information may be gained by, and great credit is due to M. Santos Dumont's perseverance, but, as far as my few experiments have led me to form an opinion, I consider that for a practical machine the aeroplane must eventually supersede the aerostat, and it may be questioned if Professor Langley is not, after all, nearer the solution of the problem. If I may be permitted to submit a scheme, may I suggest the future air-ship should consist of a light hull similar to Professor Langley's model, with an aeroplane on either side and a central one disposed like a "centre board" to preserve the equilibrium? The question of disposing the propellers is the most difficult part of the whole matter, for, if not carefully arranged, the balance of an air-ship may be easily upset entirely by the unequal forces set in motion. Four screw-propellers disposed beneath each aeroplane fore and aft seem to afford most advantages, and it may be suggested that they should be connected in pairs. As to the method of raising the vessel from the ground, might not this be carried out by a modification of the principle employed by Count Zeppelin (although employed long previous), namely, a weighted car, which is drawn to either end to rise or fall, or stationary in the centre when the ship is required to pursue its course horizontally? By using this device, the ship being supported in any suitable manner by light wheels, for instance, the head of the vessel is inclined upwards and the two side aeroplanes (which should be pivoted so as to be capable of horizontal movement), are likewise set at the same inclination. The motor is then started, and it is presumed the vessel would then rise, making an angle with the horizon depending on the position of the aeroplanes and ballast car. These ideas are doubtless very crude, but perhaps worth a trial, for should they prove effective the difficulty of mounting vertical propellers, together with the enormous power required to drive them, would be avoided. Mr. F. H. Wenham, whose authority I presume no one will question, states that from actual experiments carried out by him the power to raise 100 lbs. in the air vertically is as much as 3 h.p. (actual). We have here a basis for future experiments, while M. Santos-Dumont has already nearly solved the problem of a suitable motor.

The steering difficulty I scarcely think will be so troublesome as the actual raising of a machine without the assistance of a balloon. According to what has been done in this direction the hollow square rudders of the ingenious American experimenters, Messrs. Rufus Porter and Marriott, seem to afford the simplest device for the purpose.—Yours faithfully,

SIDNEY RUSSELL.

THIRD-PARTY INSURANCE RISKS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see in your last week's *Journal* that "H. G. E. C." asks for the address of an insurance firm who undertakes third-party risks for motorists. Mr. Cuthbert R. Callard, of 25, Golden Square, Regent Street, London, undertakes these for a well-known firm (though I forget just now which) on very reasonable terms. I have always found him most obliging, and I feel sure he would willingly send full particulars to any motorist who wished to be so insured.—Yours faithfully,

J. REGINALD EGERTON.

SIR,—In your issue of last week, "H. G. E. C." asks amongst other questions what insurance company undertakes third-party risks. If I am not mistaken, I think that he will find that the Law Accident Insurance Society, of 215, Strand, takes such risks at a small cost, also covering the car against damage, fire or theft, and the owner or his engineer against personal accidents. The Society was certainly issuing such policies from its stand during the last Motor-car Exhibition at the Agricultural Hall.

Yours truly, POLICY HOLDER.

THE LATEST IN MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was staying in the Isle of Man a week or two ago. Of course I kept a sharp lookout for any sign of automobilism. During a fortnight's sojourn this is the only *mototial* evidence I came across. There was a label on it, on which the waggish owner announced that it was *A motor-car* worked by a donkey-engine! It was waiting for hire by the halfpenny ferry on

the old quay at Douglas, and the proprietors earnestly invited me to have a threepenny ride. The memories of my childhood concerning mailcarts or donkeys, did not require jogging, so I declined with thanks, and told the grinning Manxman that I had one as good at home, and my very own! When I enquired, he said that there was a gentleman on the island who possessed a real motor-car, but it was not for hire, neither was it much *en evidence*.—Yours truly,

AMITA.

YORK TO LONDON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been much interested in reading in the *Journal* the different views expressed by some of your correspondents of my account of "A Run from York to London." One of them "J. E. H." reckons my time at 19½ hours, but I hope that he does not think that I sat on my car all that time. From this 2½ hours must be deducted for a stop at Retford, 2 hours

for a stop at Stamford Bridge and another hour for a stop at Colliers End. Besides these three stops, some delay was caused by my friend taking an occasional spell at the wheel, and the road being closed for repairs between York and Selby. This last led to my taking a wrong turning in the dark and added another twenty miles to the journey.

My sole object in sending you an account of the run was to point out the difference in cost between bringing the car to town by road and by rail. Still, as it is, I claim to have averaged a speed when travelling of twenty-four miles an hour. Had I been seeking to establish a record I could have done much better as regards both time and cost. As to "J. E. H.'s" surmising that his 8 h.p. Panhard could have done the journey in half the time and at half the cost, I can only say that for the last week I have been travelling in company with an 8 h.p. Panhard, and find that I have the best mileage at the lowest cost. "J. E. H." asks what a poor man with a steam-car does on an ordinary run. In my opinion, the poor man with a steam-car will in course of time beat any other man on a petrol-car. I may also mention that though I have driven a Gardner-Serpollet since first that car was introduced into this country, I have never been hung up on the road. Some companies make a feature of advertising the thousands of miles their cars have run; I think that I could double and treble any such records, having used my car every day since 1897.—Yours truly,

F. H. HUNT.

MR. J. W. COULSON writes:—Can one of your readers give the cause of the exhaust box bursting with a tremendous bang, and also state what is the best plan to adopt for preventing a new exhaust box from doing the same?

REFERRING to a letter *re Grease Troubles*, which appeared in a recent issue, we are informed by Mr. H. Harris, of the Elephant Chemical Company, Neat Street, Old Kent Road, S.E., that they supply a grease manufactured with the special object of obviating such troubles.

MR. M. O'BRIEN, 30, Angier Street, Dublin, undertakes repairs to motor-cars of all kinds and keeps a stock of all the usual parts.

THE Daimler Motoren Gesellschaft, of Cannstatt, Germany, are now building a Mercedes car of 15 h.p. weighing between 950 and 1,000 kilogrammes.

M. SIMAIS, Director of the Persian Customs on the Persian Gulf, has just left Paris, taking with him a 9-h.p. De Dietrich car on which he intends to make a tour up the valley of the Euphrates.

ONE of the items of the ninth annual exhibition of flowers, plants, fruits, and vegetables held under the auspices of the Spittlegate Workmen's Institute, at Grantham, on Tuesday last, was a motor-car demonstration arranged by the Lincolnshire Automobile Club.

THE constant use which the King is making of his motor-cars affects the railway companies to some degree, states the *Court Journal*. Upon the occasions on which His Majesty has driven to Windsor the arrangements at London and Windsor, the cost of special trains and their attendant expenses, have naturally disappeared. This was also the case upon the occasion of His Majesty's week-end visit to Lord and Lady Alington at Down Place, Berkshire. The disappearance of the inevitable ceremonies of the departure and arrival comes, of course, as a pleasant relief and a considerable saving of time.

AT the last meeting of the Standing Committee of the Automobile Club the Secretary suggested that there should be displayed in the Club premises maps of the United Kingdom on which could be shown, by small flags, the towns in which the sale of petrol and motor spirit had been established by Messrs. Carless, Capel and Leonard, and the Anglo-American Oil Company, respectively. Letters were submitted from these firms agreeing to the suggestion, and the Secretary reported that the Anglo-American Oil Company had offered to present suitable maps for use by both firms.

THE IMPERIAL PETROL CARS.

WE are able this week to illustrate two of the different types of petroleum-spirit motor-cars which have lately been put on the market by the Imperial Autocar Manufacturing Company, Ltd., of Manchester. The company had taken space at the recent Show, but at the last moment were unable to avail themselves of it owing to the pressure of orders on hand. They had several cars finished, but as delivery had been promised definitely to their customers they had unfortunately to forego the publicity of the 1901 show. Fig. 1 shows the Imperial voiturette adapted to seat two or three persons. It is driven by a water-cooled motor of $3\frac{1}{2}$ h.p. The engine, which is located in the front part of the frame, is of course provided with electric ignition. Usually a two-speed gear running in an oil bath is fitted to this car, but three speeds ahead and one reverse can be provided for if desired. No chains or belts are employed in the transmission, the power of the motor

FRENCH AUTOMOBILE PROGRESS.

A WRITER in *Le Velo* presents a scientific review of recent automobile construction in France. There is still much to be done, he says, from all points of view. The field of experiment with automobiles is still very large, as they undoubtedly do not yet approach their final form. Nevertheless, the last exhibition left its mark on the road of progress, as it noted, as special characteristics, the disappearance of the motor-cycle, the eclipse of the voiturette, and the advent of the light vehicle, which is not only solid and strong, but graceful and elegant at the same time. It has often been said that the motor-cycle was only a step in the progress of the automobile, a necessary intermediary without doubt, but one which would soon disappear as a result of its defects; want of comfort and of protection against mud, dust, and accidents, and especially its frailty. The voiturette was the next stage. It has a regular seat for two, and

FIG. 1.—THE IMPERIAL VOITURETTE.

being conveyed direct to the rear axle by bevel gearing. The road wheels are of the cycle type, shod with pneumatic tires, while steering is controlled by an inclined hand wheel. Two independent and powerful band brakes are provided, these acting in both a forward and rearward direction. Fig. 2 (p. 434) shows the Imperial light car with *tonneau* body to seat four persons. This is a more powerful car than the voiturette, being fitted with a vertical water-cooled engine of 6 h.p. Three speeds forward and one reverse are available, the power being transmitted direct to the rear axle by bevel gearing, no chains or belts being used. The steering is of the inclined wheel type, while the cycle type road wheels are shod with pneumatic tires. Great attention has been paid to the braking power, the rear axle being equipped with no less than four band brakes. The Imperial Company also make a 6 h.p. Spider phaeton on the same lines as the car illustrated in Fig. 2. We hope to have an early opportunity of trying the Imperial cars, when we shall probably have something more to say about them.

therefore offers more comfort. But its construction is still too light, and its insufficient power became very apparent when an incline of some steepness forced one of its occupants to step out and push until the top was reached. On the other hand, the light vehicle, with a more powerful motor, a strong frame, and elegant carriage work, is more practical, while differing greatly from the heavy vehicle in price as well as in elegance and in the general arrangement.

Frames are being built stronger. U-section iron and steel is substituted more and more for the cold-drawn steel tubes. The bodies which are adapted to these frames are dismountable; there are fewer levers, coils or wires to be loosened, and less piping to be taken off. Suspension on semi-elliptic and C springs becomes general. The diameters of front and rear wheels approach each other, which is an advantage in so far as it reduces the extra pieces to be carried on the road. In general, designs are becoming more refined and vehicles are

lengthened. The centre of gravity of the whole vehicle is lowered, and thus safety in turning corners is increased.

The motors, generally placed in front, are air-cooled up to $2\frac{1}{2}$ or 3 h.p., and sometimes have air-cooling ribs on the cylinder and a water-cooled head. But in the majority of cases recourse is had to water cooling for both cylinder and head, the water being circulated by a pump or by thermo-siphon action. But a rotary pump is preferably used, as it permits radiating coils to be placed entirely in front of the vehicle, where they are fanned by the air currents, and thus reduce the amount of water used per day to a few litres. The valves and the piping are enlarged, permitting the motor to give its full power. The admission valves are always automatic, while the exhaust valves are operated mechanically, mostly by cams. A regulating device varies the lift of the valve according to the speed. On large vehicles a special device does away with the effect of the governor when approaching steep hills, to obtain the full power of the motor. In two models a new form of regulator was shown which does not act on the exhaust, as has been the custom heretofore,

motor with tube ignition in which the time of ignition could be advanced by a variation of compression.

Carburettors a *barbotage* (in which the air bubbles through the petrol) are disappearing; those working on the constant level principle and using a sprayer may be seen everywhere, the various models differing but little from each other. Automatic distributors, which are still very rare, seem to be specially adapted to carburetted alcohol in explosion motors. Friction clutches are nearly always conical and are operated by a pedal. Speed changing gears present more novelties. The belt finds less and less favour; gears are generally used, either with the well-known shifting gear arrangement or with the newer construction, in which the teeth remain always in mesh and free on the motor shaft, to which they are fastened either by a movable key, friction clutches, or positive clutches, these diverse organs being operated by a small handle mounted near the steering post. The reverse motion is nearly always obtained by the interposition of an intermediate pinion between the pinion and gear of the slowest speed. Transmission to the wheels is generally by chains in the large

FIG. 2.—THE IMPERIAL LIGHT CAR (see page 433).

but on the admission of the charge. Experience will show whether these two systems are practical.

Handle steering has been abandoned, and the hand-wheel with inclined axis is universally used. Around the steering head post are grouped the operating handles, including the levers for changing the gear and for timing the ignition. Steering is controlled by the front wheels, pivoted on short axles, through the intermediary of a gear sector and a pinion, a demultipliering device which is always reversible, at least according to the statements of the manufacturers. Brakes are more powerful. There is nearly always one on the differential, and two on the hubs of the rear wheels. These are band brakes which must be carefully isolated from the interior mechanism that they may not become covered with oil and grease, which would prevent an effective braking. Electric ignition has become general on account of flexibility secured by an advance of the ignition; we have, however, pointed out how desirable would be the advent of a

vehicles, and by a single central shaft with Cardan couplings in light vehicles.

THE success which has attended the day service of motor-vans between Tunbridge Wells and London has led to the rapid inauguration of the promised night service. The first night car took the road on Friday last week, and, having accomplished its journey without a hitch, delivered its consignment of goods in and about Tunbridge Wells early on Saturday morning.

THE three days' run of the Yorkshire Automobile Club to Settle, Ripon, and Harrogate commenced on Saturday last, members leaving City Square, Leeds, at two o'clock for Settle, where the night was passed. Under varied meteorological conditions the tour was continued, Sunday evening finding them at Ripon, and Monday with the North of England Cyclists in camp at Harrogate.

HERE AND THERE.

THE directors of Friswell, Limited, have declared and paid a dividend of six per cent. for the first six months of this year.

AFTER their wedding at St. Peter's Church, Tunbridge Wells, last week, Mr. and Mrs. M. S. Bower left Dunorlan, the residence of the bride's parents, on a motor-car for Malling, en route for Scotland.

UNDER the heading of "The Cult of the Ungainly," the *Birmingham Daily Argus* has delivered a pleasant little lecture on moderation in the speed of motor-cars. Perhaps this ought to settle the vexed problem.

A SCHOOL of instruction in practical automobiling has been opened at 1684, Broadway, New York, in the "Central" storage and repair station which has recently been established there by the New York agents for the "Gasmobile."

TO-DAY (Saturday) the members of the Manchester Automobile Club will hold a run to Buxton.

THE Municipal Council of Singapore has ordered a Thornycroft steam tip-waggon.

A SPECIAL motor-car is, it is announced, being constructed by Messrs. Charron, Girardot, and Voigt, of Paris, for the conveyance of racehorses between that city and Maisons-Lafitte.

THE Automobile tour of Ireland started from Dublin on Thursday. At the time of writing we learn that over twenty-five cars have been entered for the tour.

WE understand that the British Motor Traction Company, Ltd., have lodged an appeal against Mr. Justice Farwell's decision in the Maybach carburettor action.

THE Municipal Council of Philadelphia has authorised the city controller to sign the warrants for an automobile to be used by the city architect.

VISIT OF AUSTRIAN MILITARY OFFICERS TO THE AUSTRIAN DAIMLER MOTOR WORKS AT NEUSTADT, VIENNA.
(Cliche de) [Allgemeine Automobil-Zeitung.]

A TWO-MILE motor-cycle handicap race at the Harrogate Athletic Sports on Monday last resulted as follows:—A. Farnell, Bradford, 1; J. W. Stocks, Birmingham, 2; H. Rayner, Cleckheaton, 3.

MR. MARK FOY, of Sydney, has placed an order with the Austral Cycle Agency for a 10 h.p. Panhard car. The car is to have special fittings for Australian roads, and is, it is stated, to cost £1,000.

THE Caledonian Motor-Car and Cycle Company, of Aberdeen, furnished one of their Caledonia motor-cars to drive Colonel Eustace Balfour, the commanding officer of the London Scottish Volunteers, during the route march from Aberdeen to Blairgowrie from the 3rd to the 10th inst.

CLUB GARAGE, LIMITED, is the title of a concern which has been registered with a capital of £2,000 to acquire under an agreement with C. Harrington Moore the business carried on by him as the Club Garage, and, generally, to carry on the business of storers, dealers in, and proprietors of motor and other carriages, etc.

H.R.H. THE DUKE OF CONNAUGHT, while visiting the Forces in Ireland recently, drove to Blackrock in the Locomobile steam-car belonging to Major-General Sir H. M'Calmont.

THE new De Dion voiturette with the engine in the fore part of the frame is expected to make its appearance in November next.

THE members of the Reading Automobile Club had a run to Southampton last week end, for Cowes Regatta; to-day (Saturday) there will be a run to Beaconsfield.

MR. J. BAXTER, of Gravesend, has purchased five motor-cars with the intention of making excursions daily from Gravesend to interesting places in Kent. Lord and Lady Darnley were taken for a trip round some of the Kent villages by Mr. Baxter one day last week.

THE contributor of the article entitled "A Run on a Gardner-Serpellet," in our issue of July 20th, writes to point out a slight error. The phrase "a hill with a gradient rising from 1 in 30 to 1 in 90," page 383, col. 2, line 3, should read "from 1 in 30 to 1 in 9½."

MR. G. OWEN, of 69, Port Street, Stirling, N.B., is now keeping a stock of petrol, and is able to undertake motor repairs.

THE Bexhill Motor Company, of Bexhill-on-Sea, are well laid out to undertake repairs to motor-cars and have a useful inspection pit.

THE Reading Automobile Club's Petrol Consumption Trial has unavoidably been postponed until later in the season. It is hoped that the Committee will be able to fix a date in September for the trial.

THE Automobile Club will soon have recorded its 1,000th member. The latest list of elected candidates brings the total up to 986, and includes Lord Plunket, the Marquis of Downshire, Sir J. H. P. Hume-Campbell, Bart., and many other well-known people.

THE Brighton and Sussex Motor-Car and General Engineering Works, Gloucester Road, Brighton, have been appointed sole agents for Brighton and district for Van Raden's Woven Glass accumulators and ignition apparatus and also for Boulton Bros. and Co.'s "Wilburine" and "Valvoline" motor oils.

AT the Doncaster Wanderers' Cycling Club Sports, held at Bennithorpe on Monday last, a one mile motor pursuit race, open to members only, was won by Mr. C. Parker, on a motor-bicycle, in 2 min. 19 sec., Mr. W. Corkett, on a motor-quad, being second, 2 min. 21 sec., and Mr. J. W. Brown on a motor-car third, 2 min. 25 sec.

AT the quarterly meeting of the Lancashire County Council, at Preston, last week, Alderman W. W. B. Halton, in moving the report of the Main Roads and Bridges Committee, referred to the licensing of the drivers of motor-cars, and to the placing of caution boards along the roads where necessary. He said it was not intended to reduce the maximum speed of twelve miles an hour. In answer to a question as to what size it was intended the identifying numbers should be Alderman Halton said that they would probably be about six inches in length.

THE International Motor-Car Company, Limited, of 76, High Street, Marylebone Road, London, W., have sent us a copy of a useful and interesting booklet they have issued, giving instructions for the driving and management of the Charette. Lettered illustrations are given, so that the main features of the motor and mechanism can easily be identified. The instructions, which have been written by Mr. F. Oscar Seyd, are both practical and comprehensive. The booklet runs to 25 pages, the last two being devoted to some brief but useful "Points to Remember."

LORD ROTHSCHILD made the occasion of his presenting prizes at the Aylesbury Athletic Sports the opportunity of expressing his views on motor-cars. His lordship remarked that in their search for novelties the committee had introduced races for automobiles, and he candidly admitted that he regarded these machines with as much dread as did cyclists. He should like to see motor-cars paying a heavy licence to help to keep the roads in proper order, and their speed should be so regulated that they would not be a danger to foot passengers or to those who used carriages.

THE Winton Motor-Carriage Company, of Cleveland, U.S.A., are issuing an artistically illustrated and arranged booklet, descriptive of their petrol motor-cars. The various types of these which decorate its pages are models of neatness and apparently comfort also, whilst the many views of the company's various workshops, dying away in dim perspective, suggest an enormous output. But what will be still more interesting to prospective purchasers of motor-cars is the stubborn array of facts, in the form of records established under all sorts of conditions by Winton cars, which is also to be found between the covers of the booklet. It is claimed that no user of the Winton motor has ever been the victim of accident resulting from fire or explosion. Friction is reduced by means of direct gearing to an improved differential upon a new rear axle. Water circulation is maintained by means of a small rotary pump, and a new system of brakes, which can be locked so as to hold the car on the steepest hill, adds yet another feature to the security and comfort claimed for the Winton cars.

THE PHOENIX MOTOR-BICYCLE.

THE accompanying illustration shows a new motor-bicycle which has just been put on the market by Mr. J. Van Hooydonk, of the Phoenix Cycle and Motor Works, 736, Holloway Road, London, N. As will be seen, the arrangement of the motor and driving gear is similar to that adopted in the Minerva and Excelsior motor-bicycles, but in the new machine Mr. Hooydonk has incorporated several additions and improvements. The bicycle itself is a strong roadster of normal dimensions, built with two 26-in. wheels, having special Clincher or Dunlop pneumatic tires. The frame tubes are reinforced wherever necessary to enable them to withstand the strain set up by the motor drive. Pedals are provided, geared in the usual way by a chain to the back wheel, to enable the rider to start the machine from a standstill, an ordinary free-wheel clutch being fitted whereby the pedals serve as footrests immediately the engine takes up the work. The engine itself is clipped on to the lower tube of the bicycle just in front of the pedal crank bracket, and is supplied with gas by means of a pipe which leads from the top of the carburettor situated in the front part of a flat brass box suspended from the top rail. This box also contains a supply of petrol sufficient to carry the bicycle from 70 to 80 miles without refilling. Compartments are also provided to accommodate the sparking coil and accumulator as well as spanners, oil can, and all the little

accessories which would otherwise have to be carried in a tool bag slung behind the saddle. The whole of the engine's movements are controlled by four little taps situated on the top rail, and the electric spark is switched on or off by turning the left handle. It may also be mentioned that the motor is fitted with a useful exhaust valve lifter, the first movement of the lever controlling the same being to interrupt the electrical circuit. A powerful rim brake operated by Bowden wire mechanism is fitted to the rear wheel. A simple means is adopted for the lubrication of the engine, a supply of lubricating oil being carried underneath the coil box; this oil can be instantaneously injected into the crank chamber by means of a ball-valve pump whilst driving along at full speed. Another improvement is a tank for carrying a reserve supply of petrol. This is made to fit behind the seat pillar tube, following the curve of the back wheel and connected to the carburettor tank by means of a pipe, so that when the ordinary supply of petrol is exhausted after seventy or eighty miles riding the carburettor tank can be replenished by pumping the petrol from this reserve tank by means of an ordinary tire inflater. This enables a supply of petrol to be carried to drive the bicycle in all about two hundred miles, so that the tourist need never be stranded for lack of fuel. Mr. Hooydonk informs us that he has made several journeys of 200 miles without having to refill the petrol tanks.

SIGNORA ELEONORA DUSE is one of the latest converts to the automobile. She is so delighted with the new means of locomotion that she has ordered a 12 h.p. car for her own use.

THE MODERN VERSION OF JOHN GILPIN'S FAMOUS RIDE.

TO commemorate the twentieth anniversary of his marriage John Gilpin, an honest draper of London, has decided upon a little party at the "Bell," at Edmonton. Mistress

Gilpin and the children being despatched in a carriage, John mounts his motor-tricycle.

On his agile mount he makes the pace, but the two bottles of good wine which he carries at his belt suffer, and off goes his wig.

Quick as the shaft of a brawny bowman, Gilpin, out of breath and against his will, overshoots the "Bell," and comes to the pond at Islington.

Mistress Gilpin, at the "Bell," becomes alarmed.

At Islington, however, Gilpin has a trusty friend, who lends him some clothes and a wig. Gilpin remounts his steed, cooled

by the bath—an incomprehensible accident, which cannot happen again, he declares.

Alas! what whim has taken the swift steed! Once more it refuses to stop, and repasses the "Bell," frightened no doubt by the barking dogs.

"Jump on to your bicycle," said Mistress Gilpin to a lad at the "Bell," "and try to catch my husband. Here's a shilling for you."

But the steed, seeking the stable, would not stop before reaching home, and then went right into the shop. Next time John Gilpin mounts it, may we be there to see him!—From *La Nature*.

FURIOUS DRIVING CASES.

At Bournemouth Dr. Harrold Simmonds was summoned for furiously driving a motor-car on July 23rd. P.S. Greenslade stated the defendant came across the Square from Commercial Road at about 14 miles an hour. There was considerable traffic about, and a collision nearly occurred at the approach to Richmond Hill. Fined 14s. and 6s. costs.

At Otley Ernest Broadbent, who was charged with furiously riding a motor-tricycle at Baildon on July 20th. Evidence was given by P.C. Rouston that the defendant travelled 220 yards in 25sec., and by a Baildon resident, who said Broadbent was travelling at the rate of 24 miles an hour. A fine of 10s. and costs was imposed.

At Guildford Mr. A. Van Andra was fined £10 for travelling at excessive speed on a motor-car on the Ripley road. A constable said the pace was 22½ miles an hour.

At Huntingdon Division Petty Sessions, G. F. Cecil, of Stretton, Rutland, a lieutenant in His Majesty's Army, was charged with driving a motor-car at a greater speed than twelve miles an hour at Alconbury Weston on July 12.—Defendant pleaded guilty.—P. C. Bozeat said he was on the North Road at Alconbury Weston at 4.40 p.m. on the day in question and he saw a motor-car coming at a very fast rate. He stopped it and said to the defendant "You have come half a mile in fifteen seconds under the minute." There were two men in the car and defendant said he was in charge of it. Witness had received several complaints about the rate at which it was travelling.—Fred Hubbard said he was leading a horse at Alconbury Weston, and a motor-car came by at a terrific rate and frightened the animal, which ran away. A child narrowly escaped being hurt.—After the magistrates had retired, the chairman said it was a serious case. Defendant was driving at a terrific pace through the village, and the public must be protected. However the bench would deal leniently with defendant and he would have to pay £5 and 14s. 6d. costs.

MR. ROBERT H. HUMPHRYS, of Sevenoaks, was summoned at the Winchester Petty Sessions for driving his motor-car from Basingstoke to Winchester at a greater speed than twelve miles an hour and furiously so to endanger the lives and limbs of persons on the highway. A police constable gave evidence to the effect that the motor-car was going at the rate of twenty miles an hour, and this statement was supported by a man who stated he was near the police-constable. After a searching cross-examination of the witnesses, Mr. Staplee Firth, who defended, put his client and his nephew, who were both in the car at the time, into the box and then addressed the bench for the defence. The case was dismissed.

FATAL ACCIDENTS.

ON Saturday afternoon last as Mr. H. A. Hoy, chief mechanical engineer of the Lancashire and Yorkshire Railway Company, of Bromley Cross, Bolton, was proceeding in a motor-car through Galgate towards Lancaster two children were crossing the road. At the sound of his horn the elder child let go the younger, Herbert Benson, aged three, and the motor-car passed over him causing instant death. At an inquest held on Monday it was stated that the child "dashed across the road like a hare." The police evidence agreed that the speed of the motor-car was twelve miles. A verdict of accidental death was returned, and Mr. Hoy was acquitted of blame, but the jury added a rider to the effect that the speed of motor-cars should be reduced to less than twelve miles an hour when passing through villages.

ON Thursday last week a lengthy coroner's inquiry was held at Gravesend touching the death of Frederick Charles Curtis, aged five years, son of a Northfleet engine-driver, who was knocked down and killed on the London road between Northfleet and Gravesend by a motor-car driven by Sidney Lodge, in the employment of Messrs. Smith and Day, motor-car proprietors, Gravesend. Deceased, whose skull was fractured, ran off the pavement into the road in front of the car. The driver stated that he was going at a speed of from nine to ten miles an hour; he did not see deceased until within six yards of him. He had been a motor-car driver a week, having previously had about a week's tuition for the duty.—After considerable deliberation the jury returned a verdict of "Accidental death," and expressed the opinion that the drivers of motor-cars should be instructed to slow down speed in crowded thoroughfares and where children assembled, such as in front of public schools.

CHARGING ARRANGEMENTS FOR ELECTRICAL VEHICLES.

A CONFERENCE of firms interested in electrical vehicles was held at the Automobile Club on Thursday, the 25th ult. There were present:—Mr. Theodore Chambers, of the British and Foreign Electrical Vehicle Company, who was voted to the chair; Mr. Roger W. Wallace, the chairman of the Club; Mr. Paris Singer, of the City and Suburban Electric Carriage Company; Mr. H. W. Buttler, chief engineer of the Electrical Power Storage Company; Mr. Percy Northley, of the Electric Motive Power Company, Limited; Mr. Carl Oppermann; Mr. Joel, of the Electric Carriage, Motor and Battery Syndicate; and the Club Secretary. Mr.

Chambers explained the purpose of the meeting, and submitted a map which he had prepared showing some 130 charging stations in England and Scotland. A letter was read from Mr. Frederick Shippey, of Shippey Brothers. Mr. Roger Wallace stated that makers and users of electrical vehicles were much obliged to Mr. Chambers for the trouble he had taken in preparing this map. Mr. Chambers submitted replies from charging stations received by Mr. R. E. Phillips, in response to a circular issued by him, from which it appeared that engineers in charge of electrical charging stations were quite ready to afford facilities for the charging of electrical vehicles. It was agreed that the editor of the *Electrical Review* should be asked to publish a copy of Mr. Chambers' map, and to invite the co-operation of readers by informing the editor of electrical charging stations, whether public or private, the owners of which would be willing to give a charge of electricity to electrical vehicles touring in the country. It was further agreed that the Automobile Club should be invited to write to the engineers of charging stations in the country asking whether they can give 110 volts, and whether they will have resistances to bring the current down if necessary to 90 volts, and whether they will agree to charge not more than 3d. per unit as the uniform charge; further asking whether they will provide facilities by which electrical vehicles may be charged rapidly and without delay. It was reported that the Automobile Club had decided to have a special class for electrical vehicles in connection with the Glasgow Trial, and it was agreed that the Committee of the Automobile Club should be asked to call a meeting of those interested in the manufacture and sale of electrical vehicles, to consider arrangements for a trial of electrical vehicles in London.

A NEW system of storing and using petrol, which claims to avoid all danger of explosion, is to be exploited by a New York company. The system, which will be known as the "gasogas," is applicable to automobiles and other machines. The petrol is contained in an absorbing material. A *bidon*, which will hold 5½ gallons of liquid petrol, will with this system have a capacity equal to 1,000 feet of illuminating gas.

THE following additional entries have been received for the Glasgow Trials:—Section I.—Durham, Churchill and Co., Sheffield, one vehicle; Stirling's Motor-Carriages, Limited, Glasgow, two vehicles; and the Mo-Car Syndicate, Limited, Paisley, two vehicles. Section II.—Mr. Harvey du Cros, jun., Mr. J. D. Siddeley, Mr. Walter Creber and Mr. James Burns. So far fifty vehicles have altogether been entered for the trials.

THE Dublin County Council has resolved to ask the Local Government Board to reduce the limit of speed allowed for motor-cars from fourteen to twelve miles an hour, and to insist upon a regulation making it essential that the cars should be provided with a number in a conspicuous place to enable identification to be effected.

DURING the Pan-American meet of the League of American Wheelmen, to be held in Buffalo from August 12th to 18th, the E. R. Thomas Motor Company will give free lectures and demonstrations at its factory in that city on the use and misuse of air-cooled motors. To these lectures all cycle riders, dealers and repairers are invited. Preliminary to the demonstrations visitors will be shown the various tools, jigs, etc., that enter into the construction of bicycle motors. Following this will come the lectures and demonstrations, and the latter will include the testing of motors as carried on by the Thomas Company in its daily routine of manufacture, and also the means for putting motors right when trouble arises.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, AUGUST 17, 1901.

[No. 128.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

MOTORISTS generally will learn with sorrow of the serious accident which befell Captain Laycock and his friends on Sunday last. The cause of the mishap, an account of which is given on another page, is, in the meantime, involved in mystery, but will doubtless be explained in due time. Curiously enough, another well-known motorist, Mr. E. Kenealy, of Watford,

passed over the same route on his Delahaye car, half an hour after the accident, on the way to Scotland. Needless to say he stopped to render any assistance that he could. In the course of a letter to us on the subject of the accident Mr. Kenealy states: "Captain Laycock wanted me to drive him home (seventeen miles), but the doctors would not let him go. This was a pity, as we could easily have taken him in an hour and he would have been better off. The French driver was absolutely uninjured. The car, which was a 24 h.p. Panhard, was not very much damaged. It turned right over and then righted itself, facing the direction from which it had come. My opinion is that the brake on the right hand wheel worked and the other did not. This threw the car round and it struck a mound at the side of the road broadside on, turned right over, and then righted itself." Captain Cradock, who was so seriously injured in the accident, has seen over twenty-five years' service in the Navy, and was promoted only last year for his gallantry in the storming of the Taku Forts during Admiral Seymour's attempt to relieve the Pekin Legations. We are glad to learn that his condition has taken a slightly more hopeful turn and that the other victims of the disaster are progressing favourably.

Killing the Goose.

THE hotel interest has not been slow, as a rule, to recognise the beneficial influence of the motor-car in restoring to some extent the prosperity of the old coaching days, and it was with some surprise that, when passing through Keymer lately, we saw a notice over the entrance gates of the Downs Hotel, "Motors Not Admitted Here." Automobilists, as a rule, are pretty sure of a welcome at good hotels, and though foolish and short-sighted prejudice may exist, it has rarely been displayed by mine host, even in the early days of the movement. There is little fear, however, of the notice not being carefully observed by owners of motor-cars, who, as the proprietor of the Keymer establishment may come to realise, are a rapidly increasing source of profit to country hostleries.

Why not Automobile Ambulances?

A DEPUTATION representing the Committee of the Manchester and Salford Medical Charities has waited on the Watch Committee of the Salford Corporation, requesting them to consider a proposed horse ambulance service in the borough, and pointing out the desirability of adopting more expeditious means of conveying injured persons to the hospital. The Committee has appointed a sub-committee to inquire into the working of the horse ambulance service in other towns. The

attention of the Committee might well be drawn to automobile ambulances, which have recently done such good service in New York.

A Too-Frequent Impudence.

WE have been often surprised at the touching confidence with which owners of valuable cars of the smaller kind will entrust them to small boys as *mécaniciens*. There is often a difficulty, it is true, in getting an expert driver, while if the owner takes the trouble to train his man himself he runs the risk of the latter seeking a more lucrative post in view of his newly-acquired knowledge. When a man, however, who would certainly not trust horses of equal value to an inexperienced stable-boy lets a callow-youth take out his car, it argues a firm faith both in the docility of the automobile, which is usually justified, and in the skill and resource of the juvenile, which is of the nature of credulity. Such were the thoughts suggested by the sight of the wreck of a good car last week, with buckled front and back wheels, and both axles bent, while the ability of the boy in charge may be gauged by his expectation that the repairer to whom he took it would restore it to running order in time to return that afternoon!

The Liverpool Heavy Vehicle Trials.

IN our issue of June 15th we detailed the awards made in respect of classes A, B, and C of the recent heavy motor-vehicle trials at Liverpool, stating that the awards in class D would be delayed for a few weeks. It will be remembered that in this class there were three competitors—the Thornycroft Steam Wagon Company, Messrs. T. Coulthard and Co., and the Mann Patent Steam Cart and Wagon Company, the latter firm being represented by two vehicles. The awards of the judges in class D, which have just been made, is as follows:—D1 (Thornycroft), gold medal; D2 (Coulthard), gold medal; and D3 and 4 (Mann), each a silver medal. In making the awards the judges remark:—"We have confidence in recommending the vehicles to which gold medals have been awarded for adoption where haulage of goods by mechanical means is contemplated. We also draw attention to vehicle No. B1, the performance of which, in respect of load and consumption, was highly creditable, whilst the tare was below the present legal limit of 3 tons. In Class D, the vehicles Nos. D1 and D2 had several points in which they were practically equal and some in which each excelled the other. We, therefore, had no alternative, where each had high merits, but to award two gold medals in this class." The report on the trials will be issued later in the year.

An Irish Guide Book.

"BEAUTY-SPOTS in the South-East of Ireland and how to see them by Car and Cycle," is the title of a most acceptable shillingsworth, by C. P. Redmond (Redmond and Co., Waterford). The book is strongly bound in cloth, boldly printed, and profusely illustrated. Roughly speaking, the ground covered is, as shown by the map in front, from Mizen Head on the East coast, westward to Nenagh, and from that town southward to Cork Harbour. The general plan followed is the division of

the district between these boundaries into one to four day tours. Each route is minutely described, and a good deal of general and historic information imparted by the way. For the tourist who may feel disposed to break his journey and make a closer acquaintance with some of the lovely spots passed through the prospects of sport and recreation are discussed. Not the least useful feature of the work is the hotel list with its detailed tariff. The wonder is that the beauty-spots of South-East Ireland are so little known to the majority of tourists who year after year spend their holiday in the same overcrowded resort or in lengthy and costly Continental railway journeys.

Strange Proceeding at High Wycombe.

THE Watch Committee of the High Wycombe Town Council, at the instance of Head Constable Sparling, on Tuesday last considered the excessive speed at which motor-cars are driven through the crowded streets of that borough. The Head Constable said the only plan to adopt to check the speed of motorists was to place scaffold poles across the streets through which their vehicles passed on their way from London to Oxford. Otherwise it was simply impossible for the police

THE "STAR'S" IDEA OF THE SCAFFOLD POLES.

to stop the cars. He further stated that under present conditions identification of motorists was altogether out of the question, as they wore goggles and dust-shields, which rendered their faces unrecognisable. The Watch Committee unanimously decided to support the police in checking what it is felt has become a nuisance and a source of danger to the lives and limbs of the community. This is not the first time that Head Constable Sparling has been heard of in connection with scaffold poles. Just about two years ago he tried similar tactics, which, however great their grievance against certain motorists who insist on exceeding the speed limit, to the general detriment of the automobile movement, is hardly a credit to the High Wycombe police force.

The Automobile Industry in England.

IN the course of an article on this subject the *Practical Engineer* remarks that it is well known to those who have followed the gradual developments which have taken place in connection with the manufacture of motor-vehicles in this country; both for purposes of pleasure and trade, that the backwardness of our Legislature in years gone by has been the means of our losing hundreds of thousands of pounds worth of trade, which has undoubtedly been captured by manufacturers of these vehicles in France, Germany, and the United States. So far as our own country is concerned, the manufacture of automobiles may be considered as only just commencing. It was only after removal of restrictions by the Light Locomotives Act of 1896 that any considerable effort was made to develop the manufacture of road vehicles in this country. Our makers are now going through an experience which our French and German rivals passed through some years ago, and they are almost totally unprepared to meet the pressing demands for vehicles on all sides, both for light and heavy work. Not-

withstanding the many drawbacks, there has undoubtedly been formed in this country the nucleus of a trade which we hope to see reach gigantic proportions within the next ten years. That it is progressing there is no doubt whatever, the greatest strides having been made in the building of private cars, though, as was shown at the recent Liverpool trials for heavy vehicles, the manufacture of the latter has been taken up in a spirited way by some half-dozen firms, most of which are now in a position to turn out vehicles which will stand an average amount of wear and tear, and do very economical work as compared with horses.

Starting from the Seat.

A NEW method for starting motors from the seat of the car by a touch of the foot has been devised by Dr. Colohan, the well-known Irish automobilist. The coil and wires are so arranged that by simply touching an electric button set in the footboard of the car the engine starts at once. It is claimed that the car may be left for hours at a time and yet a touch starts the engine each time without the least fear of failure. The great beauty of the invention is its simplicity and the absolute certainty of its working. The device will be a vast advantage, particularly to doctors, or indeed all motorists, as it will enable them to stop the engine dead whilst making calls, and start it again after taking their seat by a simple touch of the toe, this doing away with the unpleasant vibration when the car is stationary and the engine is running. Dr. Colohan has promised to furnish us with full particulars of the arrangement as soon as the question of patents is settled.

A Projected Long-Distance Tour with an Electrical Car.

IN a recent issue we referred to the run to Reading and back—altogether about 95 miles—of the British and Foreign Electrical Vehicle Company's electrical car "Powerful." We now learn that this car has completed a total distance of 2,000 miles with the same cells, and that it is proposed to run the car to Glasgow to take part in the reliability trials. Arrangements have been made all through the country for charging the battery, and the company propose making the run to Glasgow a five-day trip. As this is the first long tour undertaken with an electric car, we are looking forward to the result with interest. It is expected that the accumulators, which are of the Leitner type, will be good for at least 5,000 miles. A fortnight ago a four-day tour through Surrey, Sussex, and Hampshire was successfully carried out with the car. The matter of accumulator charging was arranged without any difficulty at Brighton, Salisbury, and Winchester, the charge being generally 3d. a unit. The only difficulty experienced has been with the pneumatic tires, not from punctures, but from occasional "bursts." The 90 mm. tires are now being replaced with 120 mm., with the view of obviating any further trouble. The car starts on its long journey on the 21st inst, via Peterborough, Nottingham, Sheffield, Bradford, Lancaster, Carlisle, and Carstairs.

Anti-Vibration Devices.

THE attention these are attracting at present in connection with cycle construction may serve to remind us that the questions connected with them are by no means finally worked out as regards motor-cars. The well known fact that comparatively heavy cars are less affected by road vibration than lighter ones, as far, at least, as the comfort of their passengers is concerned, is no doubt to be attributed in part to their heavier springs, and we have found a distinct increase in comfort with a light car accompanied by the substitution of stiffer springs for the light ones on which it was previously supported. Too much elasticity of suspension, as well as too little, causes discomfort; and elasticity *per se* is not the only desideratum (putting aside durability) in springs and tires; the limits of deformation of these under the forces usually at work must be comparable with the size of the road irregularities; if less the car will vibrate, if greater it will bounce, and the effect is more marked the lighter

the car and its load. The value of large pneumatics may be partially due to the fact that the smallest of the surface inequalities average themselves out over the whole surface of the tire in contact with the ground, leaving larger ones to be mitigated by the springs. Most drivers have noticed that there is a speed of maximum vibration with any particular car, and this is not always the highest speed; but the whole question, involving the period of vibration of the car as a whole, and its wheels and axles separately, deserves fuller consideration.

Motor-Cars at Bexhill.

MOTOR-CARS are very much in evidence at Bexhill-on-Sea, the familiar sound of the horn being heard at all hours of the day. The cars, which make frequent trips to Hastings, Sidley Green, and other places in the neighbourhood, appear to be well patronised by the visitors, and must prove an additional attraction to a town which already enjoys so many advantages. Mr. Bradney-Williams, the manager of the Bexhill Motor Company, informs us that they have three cars in constant use, and are expecting another shortly. They are all 12 h.p. Daimler wagonettes, with omnibus tops for bad weather, built specially for them. Since the company started the service last Whitsuntide, business has been good, and they hope to be able to run through the winter, more especially between places which are not served by the railway. Automobilists who may think of running to or through Bexhill can obtain petrol or lubricating oil from the company, who have ample storage accommodation for a number of cars.

Horse-Breeders and Motor-cars.

MR. WYNFORD PHILIPPS, M.P., gave utterance to a very pronounced expression of opinion with regard to the future of horse breeding at the North Pembroke-shire Farmers' Club Show luncheon, at Fishguard, last week. Replying to the toast "Prosperity to the Club," he said there was a future for breeding hunters and cart horses and a future for cobs, because they would always be a fancy article. But he did not think there was going to be any future for breeding big hackneys. He believed the market for matched pairs to which he referred would be gone in ten years. The motor-car would absolutely substitute the pair-horse carriage. (Cries of "Never.") This was a matter of opinion. He was not saying what he wanted to see, but what he thought he was going to see, and if anyone saw anything he thought was of interest to breeders it was his duty to tell it. Where there was one motor-car in London last year there were twenty now, and they were being improved as fast as the bicycle was improved from the old bone-shaker to its present form. All the rich and highly-placed people were vieing with each other in driving them, and he was expressing his own opinion when he said they would hardly see a five hundred guinea match pair of swell hackneys in London in ten years' time. They should go on breeding small hackneys, cobs, ponies, and such like; go on breeding hunters, but if anyone had any high-priced hackneys he should sell them out when he could get a market for them. It was their duty to see what was coming in the future, and be prepared to meet it. The market for the carriage horse—he did not mean in a small way in the country, where there would always be some use for them—but the really valuable carriage horse, he believed, was going to die out.

The Numbering Question at Aberdeen.

At a meeting of the Aberdeen Town Council last week the Town Clerk read a letter from a certain Mr. H. J. S. B. Cunliffe, of Oxford, suggesting that the Town Council "should make a by-law to the same effect as that which now existed in Belgium and other countries, to the effect that all cyclists and motorists should be compelled to wear a metal plate bearing the name of the town issuing it, as also a number, the same as hansom cabs." The reading of the letter raised quite a storm in a teacup, Councillor James Gray (a local cab-hirer) de-claiming against "these heterogeneous vehicles that did as they

pleased," and strongly advocating the adoption of the suggestion. Councillor Kendall Burnett, while prepared to admit that there might be something in the suggestion made by Mr. Cunliffe, said it was quite evident that this was not a question for any individual Town Council to take up. He further pointed out that the writer of the letter had no influence whatever; he had been communicating with lord mayors and mayors throughout England, but that no action had been taken. Councillor Gray moved that the question be remitted to the magistrates for their consideration, a motion which was adopted.

An Italian Motodrome.

IN consequence of the prohibition of a motor-car race billed as starting from Padua, Italian automobilists have seriously tackled the problem of a motodrome. A site suitable for such a project has been selected and the moving spirits amongst the many automobilists of that country are now engaged upon the details, which it is hoped will place the undertaking upon a firm business basis. The proposed site is close to Brescia, equidistant also from Calcinate, Montichiari, and Ghedi. The track will be thirteen kilometres in circumference, bounded on the north by the Brescia-Verona Railway. To the south it will run parallel to the Brescia-Mantona road and will include a straight run of four kilometres. It also proposed to erect in addition two grand stands and other buildings incidental to a racecourse, club-house, *garage* and workshop.

ROUND ABOUT SNOWDON. ONE OF MESSRS. DEACON'S PLEASURE PARTY CARS.

Photo by

[Mr. J. H. Crompton.]

Random Justice.

PERHAPS the most disgraceful thing about automobile "justice"—except the infliction of fines at all, in most cases—is the utter absence of reason or proportion in the scale of these, which, depending on the "discretion of the magistrates," and varying inversely as this, is calculable by no known law. A short list of the amounts in a few cases picked at random from recent reports will illustrate this, and give food for reflection.

Locality.	Speed alleged.	Fine.
Cardiff.	Furious driving—10 miles.	£5 and costs.
Carlisle.	Over 20 miles.	£1 and costs.
Consett.	Over 20 miles.	Dismissed on payment of costs and a guinea to poor-box.
Braintree.	18 to 20 miles.	5s. and costs.
Bournemouth.	13 miles.	2s.
Bournemouth.	13 miles.	£1 and costs.
Ryde.	20 miles.	1s. and costs.
West London.	19 miles.	£5 and costs.
Epping.	30 miles.	£10 and costs.
Southampton.	16 to 18 miles.	4s. and costs.
Nottingham.	16 miles.	£5 and costs.

There is, moreover, little or no justification for these discrepancies in the attendant circumstances, none of which were marked by accident, and yet such flagrant inability to make "the punishment fit the crime"—flagrant, whatever view we may take of the criminality of going at 12·1 miles an hour, is to be accepted as "justice." It only needs a reference to any police column to compare these with the usual fines to drunken carters, furious butcher-boys—though these, unfortunately, seldom appear in court till they have knocked someone down—and there is no need to occupy space with such comparisons. Enough has been said, however, to show the necessity for some system of unification of penalties for corresponding offences, and incidentally, perhaps, for magistrates who are qualified for their office by legal knowledge instead of local property.

Trouble in Long Acre.

It was expected that a case of much interest to the motor-car industry would have been heard in the Chancery Court last week. The Mercers' Company are the owners of a considerable amount of property in Long Acre, which for generations has been one of the chief centres of carriage manufacture. During the past year several motor-car warehouses have sprung up in the same locality. It appears that the Mercers' Company have in each of their leases a clause which prohibits the use of any premises for dangerous occupations. They allege that automobiles in themselves and in their manufacture are dangerous, and they are seeking to restrain two of the tenants from infringing the terms of the lease. When the case was mentioned in court last week it was at once seen that it would be one of much importance, and the hearing was postponed until the 5th November.

Yorkshire Farmers and Motor-Cars.

At a meeting in York, last week, the members of the Yorkshire Union of Agricultural Clubs had under discussion the subject of motor-cars, the reckless conduct of many of their drivers, and the speed at which they are driven, an interesting and unexpected discussion arising. The subject came up in the form of a resolution from the Market Weighton and District Farmers' Club, strongly urging the Union to use its influence with the members of Parliament representing their interests, in urging upon the Government the desirability and necessity of a measure compelling drivers of motors to produce some test of efficiency, as well as to carry a distinguishing mark or number on some conspicuous part of the machine. Mr. A. Dunhill, of Market Weighton, explained how the resolution came to be passed. It arose through one of the members of the Farmers' Club being placed in jeopardy through the recklessness of a motor-car driver, who, when he saw the gentleman's horse had become restive and had thrown its driver into the hedge, merely shouted, "Hi, Hi! How are you, my friend? Good day!"—and then disappeared. Such conduct, which was not uncommon, created a discussion as to whether motor-cars should be allowed to usurp and monopolise the entire roadway. He moved a resolution in terms similar to that from the Market Weighton Club, with the addition that "drivers should be compelled to reduce speed when motioned to by persons driving." Colonel Lloyd-Greame, in supporting, thought some test of efficiency was necessary in the interest not only of those who happened to be driving on the road, but in that of motor-car drivers themselves. The members adopted the resolution unanimously.

Technical Education.

It is to be feared that many more tons of petrol will have to be consumed in this country before a professorship of automobilism comes into being, though such an educational functionary is not unknown on the other side of the Channel; but it is an encouraging sign of the times that a wish for the services of such should be expressed, as we heard the other day in a small country town with a well-appointed technical

school. The tradespeople thereof are many of them quite alive to the business value of motors, and one, speaking of the difficulty of training existing drivers to the use of motor vehicles, expressed a wish that such instruction formed part of the County Council technical courses, with the opinion that it would soon be quite as important as the courses of plumbing, carpentry, and the like. Perhaps when the governing bodies in question have quite finished their attempts at restricting the new industry, they may—who knows!—repent at the eleventh hour and try some such means of encouraging it.

End to End on a Werner Motor-Bicycle.

STILL another end to end automobile trip has to be recorded, this time by a Werner motor-bicycle, ridden by Mr. Hubert Egerton, of Weston Rectory, Norwich. It will be remembered that Mr. Egerton went over the end-to-end course in December last in a Locomobile steam car, and although he had hardly ridden 100 miles on a motor-bicycle, the idea of a run from Land's End to John o' Groat's no sooner suggested itself to him than he started to carry it out, successfully accomplishing the trip in four days and eight hours. On two of the days continuous rain was experienced, while at Bristol a delay of twelve hours was caused by the difficulty of obtaining inlet-valve washers; the valve being eventually "botched" up with asbestos twine. Leaving Land's End on the morning of Saturday, the 3rd inst., Bristol was reached the first day. The second day's run was to Preston, and the third from Preston to Perth, *via* Shap Fell, Carlisle, and Edinburgh. Up Shap Fell the machine behaved well, making the first seven miles of the ascent without it being necessary to resort to pedalling. After leaving Edinburgh wet weather was encountered, the ride to Perth, what with the rain and the darkness, being anything but pleasant. The fourth day saw no improvement in the weather, the journey from Perth to Golspie *via* Inverness being again made in the rain, which, as Mr. Egerton puts it, "converted my air-cooled motor into a water-cooled." Between Blair Athol and Dalwhinnie the railway and road ran almost together for some distance. A railway train coming along and a clear road being available, Mr. Egerton let his motor go all out, eventually leaving the train in the rear, much to the interest of the passengers, who were all crowding round the windows of the carriages "watching the fun." The last day's run from Golspie to John o' Groat's was an unfortunate one for Mr. Egerton, for, two miles beyond Wick, a cyclist, on his wrong side of a straight broad road, and in broad daylight, ran right into Mr. Egerton, whose leg was cut very deeply and badly by the pedal of the cyclist's machine. As for the Werner, it was found that, as a result of the accident, seven of the spokes of the driving wheel had been wrenched away. A cart was obtained, in which Mr. Egerton and his machine were conveyed back to Wick. Undaunted by the accident Mr. Egerton got his machine quickly repaired and his leg attended to, and finished the sixteen miles which separates John o' Groat's from Wick. There have been many attempts to carry through end-to-end runs on motor-cycles, but this is the first occasion in which success has attended the attempt. Mr. Egerton is, therefore, not unnaturally proud of the performance and speaks in glowing terms of the "Werner" which carried him through so successfully.

FRENCH military experts are at present engaged upon a war motor which is being constructed at Saint Denis, and is expected to make its debut at the forthcoming army manoeuvres.

A SERVICE of electrical omnibuses has just been started between Reichenau and Payerbach, in Austria. Messrs. Jacob Lohner and Co., of Vienna, built the vehicles.

STOCKBROKERS and bankers in Wall Street, New York, have found a new use for automobiles since the activity in the stock market has become so pronounced. Several of the large houses employ automobiles now to carry messages from their offices to the new headquarters of the Stock Exchange. The vehicles can be seen during the busy hours of the day rushing along the streets carrying messenger boys and brokers.

THE IRISH AUTOMOBILE TOUR.

THE motor-car tour, organised under the auspices of the Automobile Club of Ireland, started from the Shelbourne Hotel, Dublin, on Thursday morning last week. There was a considerable gathering to see the start. The cars commenced to marshal at the rendezvous shortly before nine o'clock, and a dozen of various types were soon waiting in readiness for the drive to Waterford. Shortly after nine o'clock a start was made, Mr. R. J. Meerey, as pilot of the party, leading the way in his 9 h.p. Daimler; he was followed by Mr. E. F. James, of Knockdrin Castle, Mullingar, in an 8 h.p. Panhard. Three vehicles belonging to the Hon. Leopold Canning—a 6 h.p. Panhard, a 5 h.p. Century tandem, and a 6½ h.p. Century tandem followed next in order; and after them came Mr. G. G. O'Grady in a 5 h.p. Mignonette, Mr. C. Jarrott in a 7 h.p. Panhard, Mr. L. S. Macrory in an Orient Express, Mr. R. H. Fuller in a 4½ h.p. De Dion Voiturette, Mr. M. Grimshaw in an M.M.C. car, Mr. H. Du

Borris to Graigueenamanagh, where the hospitable rector, Mr. Burnett, treated the party to an afternoon tea. A fast run to Waterford followed, and on its termination Alderman W. G. D. Goff, the president of the Automobile Club of Ireland, entertained the party to dinner. At Waterford the number of cars was considerably augmented by the arrival of several English motorists. The interest taken all along the line of route in the passage of the cars indicated how keenly people of all classes realise that the tour may be a very potent advertisement of Ireland as a touring ground. The weather held up splendidly until the evening was well advanced. Amongst those who made part of the journey on the first day was the Chief Commissioner of the Metropolitan Police.

SECOND DAY.

Over a dozen cars left Waterford for Cork on Friday morning (the 9th inst.). Mr. Goff, on his Panhard, joined the party, which was also accompanied by several local motorists. At Dungarvan a most demonstrative reception was accorded, a

A PLEASANT MOTORING PARTY AT GRIMSTON, NORFOLK.

Cros in a 16 h.p. Panhard, Dr. J. H. Colohan in his 7 h.p. Daimler, Mr. Valentine Grace on a motor-tricycle, Dr. Glenn in a Daimler, Sir H. B. Bacon in a 12 h.p. Panhard, Rev. the Hon. B. J. Plunket in a De Dion voiturette, Mr. W. R. Dalton in a Marshall car, and Mr. T. R. Bradshaw in an Argyll car.

The Panhards and Daimlers setting a good pace, the open country was soon reached, and over the well-surfaced main road to Nass the going was excellent. A stiff wind prevailed, but the road was almost free from dust. Heavy clouds threatened rain, but fortunately the dullness went from the sky, and the tourists were treated to smiling panoramas of the lovely country which lies almost undiscovered in the heart of Ireland. A halt for lunch was made at Carlow, the cars being drawn up in the market place, to the great delectation of the inhabitants. Resuming the journey, a rapid passage was made through

native enthusiast having published telegraphic bulletins of the progress of the party through the principal towns. At Cappoquin, too, a great reception was in store for the motorists, the entire town seeming to have turned out to receive them. The glorious scenery along the Blackwater from Cappoquin to Lismore was keenly enjoyed. At Lismore Castle a lengthy stay was made, and from many an ivied terrace and battlement peeps were taken by the visitors at the enchanting Blackwater, which at this point is not inferior to the loveliest spot on the Rhine. A fairly rapid passage was made via Fermoy to Cork, the roads gradually deteriorating until within a few miles of that city, when they became abominable. The contrast between the roads of that district and those of Dublin, Carlow, and Waterford was very marked. The people of the villages *en route* assembled to welcome the motorists, and everywhere they were greeted with enthusiasm. Cork was reached about six o'clock,

and just then the weather changed, the late arrivals reaching the southern capital in a downpour.

THIRD DAY.

Saturday's journey from Cork to Killarney extended over a distance of 95½ miles. Thirteen cars, all told, took up the running. The weather was exceptionally good, belying all the gloomy forebodings to which the previous night's experience had given rise. A warm sun, a stretch of country rich in all that makes the southern landscape charming, gentle streams, vistas of bold hills, with occasional broad stretches of rich meadow land, continued to make the motorists pleased with themselves and everybody else. From Cork the cars sped north-west to Macroom, then there was a dip to the south to Keimaneigh Pass, and still further to beautiful Glengariff, which looked its best bathed in glorious sunshine. The way then lay northward through Kenmare into Killarney. It was a choice trip in the way of scenery, but the roads were for the most part risky. Up among wild mountains the track climbed till finally a hair-raising downward sweep of ten miles over a narrow road twisting back on itself incessantly took the tourists to the level once more. The sensation was delightful, notwithstanding the knowledge that any failure to negotiate a corner meant exceeding the narrow margin of safety and plunging over the mountain side. No incident beyond a few punctures, however, occurred on the road, and everyone expressed themselves highly pleased at the run. Mr. Fuller's car ran into the grounds of the Lake Hotel at five minutes to seven, and Mr. Du Cros came in a quarter of an hour afterwards. Mr. Grimshaw joined the party here, having driven all the way from Cashel.

FOURTH DAY.

The tourists had perforce to keep quiet on Sunday. Even Killarney never witnessed such a downright torrential day. There were a few brief spells of sunshine, but they only served to mock the visitors, who were hardly able to leave their hotels.

FIFTH DAY.

Monday was on the whole fine, though there was at least one heavy bout of rain, which made the roads muddy and sticky, and did not tend to increase the comfort of the party on the first portion of their journey to Waterville, for which all the cars started early in the morning. Twelve vehicles assembled at the Railway Hotel, Killarney, and then made a triumphal progress through the town. This was the first time the "city" of Killarney had been passed through by such a large number of cars, and needless to say the incident was regarded by the natives and the tourists stopping at the various hotels as unique. The route followed was via Looberidge, Kenmare, Parknasilla, Caberdaniel, and Derrynane. At the latter place Mr. R. J. Meccredy entertained the tourists to afternoon tea. One of the events of the day was the ride of Messrs. Jarrott, H. Du Cros, and Fuller, with Mrs. Fuller and Mrs. Edge, through the Gap of Dunloe with three cars. This is the first time the feat has been accomplished, owing to the steepness and danger of the ascent and roughness of the ground. The advent of the vehicles caused some sensation among the natives, who had never before seen a motor-car in that famous tourist haunt.

SIXTH DAY.

On Tuesday an early start was made from Waterville for Killarney, via Caherciveen and Killorglin; a striking feature of the run being the trip over Comaakiska Pass, through a dense fog. The sensation was most eerie as the cars passed through the white fog and glided swiftly round sharp bends with engines running out of gear. Soon after leaving Waterville, Mr. Jarrott's car, in avoiding a cart which had swung across the road, crashed into a wall. No mishap beyond a broken spring resulted, and he was soon able to resume the journey. Some of the party who had returned to Killarney on Monday made for Listowel on Tuesday, there to rejoin the general body on Wednesday. Dr. Colohan on his Daimler, Mr. Grimshaw on his M.M.C. car, and Mr. Murdock on his De Dion voiturette took up the running through an exquisite stretch of North Kerry, the scenery of which is varied by mountain range, vistas of sea, gentle inclines of bright pastures, and expanses of brown bog

land. A quiet pace was maintained, and the surrounding natural charms were thoroughly enjoyed. The roads, on the whole, were excellent and the weather fine, the sun sending down broiling rays at times. The curves to be taken were acute and the descents rapid, but the motorists had not the slightest difficulty in accomplishing them with success. In Tralee, where a slight halt was made, a considerable crowd collected. The short run was easily accomplished in about three hours, and then Listowel was aroused from its lethargy by a series of spins round the town, in which some of the residents partook, under the guidance of Dr. Colohan and Mr. Grimshaw. On Wednesday the entire party journeyed together to Limerick.

THE KING STARTING DEVICE FOR PETROL MOTORS.

IN starting a petroleum-spirit motor, it is very desirable to prevent the crank handle from being pulled out of the operator's hand if the engine should jerk backward. The device shown in the accompanying illustration has been designed by Mr. J. D. King, of 433, De Kalb Avenue, Brooklyn, U.S.A., to overcome the possibility of this happening, and consists of a chamber attached to the crank handle, but set eccentrically with the shaft, which it is intended to rotate in this chamber, and in which is placed a roll, or ball. In the illustra-

tion the roller is shown, although it can be equally well designed to employ a ball. As the handle is turned to the right the roller wedges between the inner wall of the chamber and the shaft, causing both to rotate together, any backward movement of the shaft releasing the crank immediately. This overcomes any backward kick, which is very objectionable, as the crank handle is thereby jerked from the hand and, revolving, strikes the back of the hand before it can be withdrawn.

It will be noticed that the crank is hinged so as to spring up and be locked when not in use, instead of hanging down, swinging backward and forward.

THE Brussels *Soir* states that Prince Albert, on leaving the Chateau of Amerois on a motor-car recently, ran into a ditch. The Prince was thrown into the ditch, but was not hurt.

THE AUTO-SPARKER.

FOR many years after the successful gas engine was designed the incandescent tube was used for ignition in gas and petrol motors. This, for many reasons, was unsatisfactory, and manufacturers turned their attention to electric ignition by means of batteries, to magneto-electric ignition devices, and later to ignition by means of small dynamos, generally belted to the engine to run at their rated speed. Batteries were, of course, still required to ignite the engine until it reached its normal speed, at which time they were cut out with a switch and the dynamo cut in. This arrangement effects a large saving in battery renewals, but increases the first cost, and when the batteries fail it is impossible to start, and on variable speed engines the dynamo is either above or below its normal

FIG. 1.

speed most of the time, which gives either a burning spark or a weak one varying according to which way the speed of the motor varies.

Almost two years ago the idea of applying a speed varying mechanism was conceived by Mr. Homer N. Motsinger, of the Motsinger Device Manufacturing Co., Pendleton, Ind., which would be automatic in every particular, utilizing the turn over of the engine necessary to compress the gas to also furnish the first spark. Not only was it necessary to make something that would stand an enormous amount of abuse, but it was necessary to make it applicable to all motors that were equipped with the usual make and break device for properly timing the spark. The Auto-sparker introduced by this company gives, it is claimed, a constant voltage due to its constant speed through all variations of the engine's speed—from that used in turning it over to start, up to any speed the motor is capable of running. This fulfils all the requirements of a battery without any renewals whatever; not even a switch being needed, the Auto-sparker and spark coil constituting the full equipment.

All dynamos have a certain speed at which they generate their normal current, and this speed cannot be far exceeded without danger. To ignite the gaseous charge by a dynamo as easy as by batteries the dynamo must be running at its normal speed in turning over the fly-wheel in starting. This is done in the Auto-sparker by using a very small friction-wheel against the fly-wheel—small enough, in fact, to run the dynamo at full speed when the engine is turned slowly by hand to compress the gas in the cylinder. When the motor takes the first explosion and finally runs up to its full speed it will be seen that unless prevented the Auto-sparker will run from six to twenty times as fast as it should. This is prevented and regulated by a governor on the end of the armature shaft, which, when the speed reaches its normal, pushes a taper sleeve (2, Fig. 1) in toward the bearing, causing the shaft to rise on a steel point (3), which raises that side of the Auto-sparker up, and forces the pulley (10) down away from the fly-wheel, since the entire machine is pivoted on the point (1) and a corresponding point on the other end. This action allows the friction wheel to touch and rise off the

fly-wheel just enough to at all times keep the speed desired, regardless of the speed of the engine or the size of the fly-wheel.

It will be noted from the above that friction and the proper control of it play an important part in the construction of the Auto-sparker. In the construction of the friction pulley a hard compressed paper made under forty tons pressure is employed. The Auto-sparker is pivotally mounted on its base so as to allow for slightly imperfect fly-wheels, and to allow the action of the governor and spring which forces the pulley out of and into contact with the fly-wheel, the regular partly-slip and partly-lift action. This keeps the paper friction pulley perfectly round and smooth if the fly-wheel is emiered off smooth. The pressure of the friction pulley is regulated by means of a tension spring and thumb-nut. When the dynamo is properly set this tension spring is pivotally strained about one-sixteenth of an inch, and the shaft is raised off the steel point about one-sixteenth of an inch, and constantly held in this position by the contact of the friction pulley with the fly-wheel. When the thumb-nut is unscrewed to its last thread the speed of the dynamo is about 600 revolutions per minute, and the amperage is, say, one, and the voltage, say, three. By screwing down the thumb-nut the position of the Auto-sparker is unchanged, but the contact of the pulley is increased until a speed of 1,200 to 1,300 revolutions per minute may be had and the amperage is, say, three, and the voltage ten. The makers state that the device gives a good spark at a speed of 700 revolutions per minute, and that the speed should not exceed 1,200 revolutions. Thus by the tension spring the speed of the dynamo and the size of the spark may be regulated at will without any danger of burning out the ignition points or damaging the machine.

In the construction of the dynamo a magnet of special soft cast-iron is used, wound with super-saturated fields. The armature is made of soft laminated steel, and insulated by best rubber fibre, wound in perfect balance and water-proofed with shellac. The laminations are held in place by brass nuts and the whole is mounted on a $\frac{1}{2}$ in. shaft having $1\frac{1}{4}$ in. renewable phosphor bronze bearings. The friction pulley is mounted on iron bearings and held in place with counter-sunk, case-hardened set-screws. The commutators are insulated with mica, and the brushes used are round special gauze, held in place by phosphor bronze springs. The springs and brushes are insulated by hard rubber bushing, $\frac{5}{8}$ in. in diameter.

The Motsinger Company state that they do not claim that the Auto-sparker will spark an engine that no batteries will spark, and that it is not a cure-all for old engines that have no

FIG. 2.—THE AUTO-SPARKER FITTED TO A CAR.

compression, no contact points, and are past running on a spark from even an electric current. They claim, however, that it will work with the same contact making and breaking devices on the engine that are used with battery ignition. All that is required is that the motor has good points which break properly, and that the fly-wheel can be turned over in the direction it is to run at a

speed that is usually had in starting with battery ignition. The Auto-sparker measures 10½ in. by 10 in. by 6½ in., while its weight is 23 lb.

We are informed that the Panhard and Levassor Company of Paris have for some time past been experimenting with the Auto-sparker, and after having convinced themselves of its practical value have decided to use it extensively, having acquired the French patent. The device has been adapted to the four-cylinder engines of the large Panhard racers, supplying the current for four spark coils, with satisfactory results.

CONVERTING DE DION MOTORS.

THE London Auto-Car Company, of Gray's Inn Road, W.C., who seem to make quite a speciality of converting De Dion motors into larger sizes, have just brought out a set for converting De Dion engines of either 1½ h.p., 2½ h.p., or 2¾ h.p. so as to develop 3½ h.p. One of the new sets was brought under our notice the other day. As will be seen from the accompanying illustration, it consists of a special water-cooled head with exhaust opening 1½ in. diameter, a new 80 mm. cylinder, corresponding piston, and connecting rod, new silencer, and two specially weighted fly-wheels, the latter being to replace the fly-wheels usually fitted. We understand from Mr. C. Rush that

several small engines have, by utilising the new set, already been converted to motors giving 3½ h.p. with satisfactory results.

Mr. C. FRISWELL has lodged an appeal against the decision of the Comptroller General of Patents in the matter of the application of Osborn and others for Patent No. 22,762 of 1900 covering the De Dion exhaust valve controller.

Mr. GEORGE F. CHAMBERLAIN, former president of the Automobile Club of America, is quoted as saying that several wealthy automobile enthusiasts are planning a plate steel or sheet steel speedway, to be built either in Jersey or on Long Island. It will cost over £200,000, and will be used exclusively for automobile racing. If the present plans do not miscarry the proposed racing road is to be 100 miles long, and if possible straight.

MOTORISTS should erect a monument to the Buckinghamshire County Council. That large-hearted body has framed a bye-law, sanctioned by the Secretary of State, to the effect that "No person shall place, deposit, or leave any article of glass, or any broken glass, or other sharp substance (not being road material), on any street or public place, in such a position as to be likely to cause danger or injury to passengers or damage to property."

CORRESPONDENCE.

THE BURSTING OF EXHAUST BOXES. TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the query of Mr. J. W. Coulson as to the cause of his exhaust box bursting, the following is no doubt the reason. One or more of the charges of unexploded gas and air have been ignited in the exhaust box. This opens up two questions. First, how did the unexploded gases get into the exhaust box? Second, How did they get ignited? The reply to the first query, presuming that Mr. Coulson refers to a car with electric ignition only, is that, on account of a short circuit, a broken circuit or a weak spark, his engine has missed fire for one or more strokes. The second question is answered in two ways: either the flame from the last explosion penetrated far enough through the exhaust valve to meet the unexploded gas in the exhaust box, or a particle of incandescent carbon already in the exhaust box was the cause of the ignition. The sudden closing and reopening of a choke valve, if there is such a thing on his car, would have the tendency to produce the same result, probably for the reason that a partial vacuum is caused in the cylinder by the stroke which endeavours to draw mixture, but finds it almost impossible owing to the choke valve being closed. The mixture of gas and air for the next few strokes, on reopening the choke valve, would not have assumed its correct proportions and would be liable not to explode in the cylinder, and might find sufficient air in the exhaust box to make suitable conditions for an explosion. In order to prevent the recurrence of this difficulty, thoroughly verify all the sparking arrangements, and use the choke valve with caution, leaving a sufficient interval between the closing and reopening of it, and doing both operations very gradually.—Yours faithfully,

J. J. MANN.

SELF-PROPELLED FIRE ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As the question of motor fire engines has lately attracted considerable attention, it may be of interest to mention that the first self-propelled fire engine, in fact, the first steam fire engine of any kind, was invented by Paul Hodges, an American, years before Merryweather or Hodges Fire Brigade were thought of. About the years 1860 and 1861 a motor fire engine was made by a Mr. Roberts, of Millwall, and this engine steamed over from Millwall to a large fire at Woolwich Arsenal, where I believe it did good service. Mr. Roberts also constructed steam fire engines for the London fire establishment, now the M.F.B. Although his engines did good work at the great Tooley Street fire they were not, however, appreciated, and Mr. Roberts died of a broken heart.—Yours truly,

MOTOR.

THE DE DION VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to Mr. Jackson's query, it is not unusual for the gearing on voituresses to "sing." In some cases this is due to the gearing not being correctly depthed, and in others not being correctly cut. The best way out of the trouble is to have a raw hide or fibre—preferably fibre-wheel, as this is not affected by oil or grease—in place of the Phospho-bronze wheel. If the pinion is not smaller than fifteen teeth, the cheapest way is to replace the steel pinion with fibre, but if money is of no object I advise replacing the large wheel with fibre. The Motor-gear Engineering Company make a special feature of the fibre wheels, and I would recommend your correspondent to write to them.—Yours truly,

W. A. O.

A SUGGESTED CLUB FOR MOTOR-BICYCLISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Considering the growing popularity of the motor-bicycle and the rapidly-increasing number of riders of these machines, I am strongly of opinion that the time has come when

a club for motor-bicyclists is needed. There can be no doubt that the motor-bicyclist requires to be specially catered for. He is undoubtedly out of his element among riders of ordinary cycles, and, as regards joining in runs with motor-cars, he is looked upon as being very small fry in the motor world. Feeling sure that there is a great future for the motor-cycle, I shall be glad to hear through you from any riders who are disposed to form a club, so as to arrange a meeting at an early date to discuss the pros and cons.—Yours faithfully, T. UNDERWOOD

GEAR TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have noticed frequent reference to the above in the *Motor-Car Journal*, and for the information of your correspondents I should like, with your permission, to state my experience with motor gear lubrication. My car is one of the New Orleans make. At the first I had much trouble with gear lubricants, and although I had samples of grease from several makers, none of the samples lubricated so efficiently as to make the gear noiseless, although some were better than others. I have had considerable experience with frictional bearings of all kinds, and quite 95 per cent. of the over-head wheels (trolley) on electric tramway cars are bushed with my oil-less bushes. I have experimented with different models of small gear wheels with the same system of lubrication, preferring not to apply it to my car gear until I was certain as to its success; but I have found that motor-car gear wheels, as at present constructed, must be lubricated with unctuous materials. I have, therefore, adopted an intermediary plan by making a composition partly of an unctuous nature and partly metallic; and have been using this for some time, with every evidence of success. My gear is now practically noiseless, and I have frequently passed cycling friends on the road who say they have not heard my car approaching until almost on a level with them. I do not need to apply the lubricant oftener than once a week at the outside, and then only a small quantity, and my gear seems to be scarcely worn, although it has run a fair distance. I may say that I am not either directly or indirectly interested in the manufacture or sale of gear lubricants, but have thought that it might at some future time be worth going into; as motor-car gear lubrication is going to be an important question in the future.—Yours truly, W. A. ENTWISTLE.

THIRD PARTY INSURANCE RISKS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your issue of the 3rd inst. that a correspondent is inquiring about third-party insurance for motor-cars. I may mention that Mr. Henry Kennett, jun., 46, Chapel Street, Islington, is agent for several insurance companies, and is in a position to effect third party risks, also fire and theft, on very reasonable terms with some of the best companies. He has effected my insurance at about £3 5s. I might mention that he is also an enthusiast in the motoring pastime.—Yours truly, JAMES LOUIS BROWN.

Re Third Party Insurance Risks.—Mr. J. H. Davison, of Thornbury, Whyteleafe, Surrey, writes: "If your correspondent H.G.E.C. cares to send me his address, I should be pleased to give him all possible information as to the cheapest method of insuring against accidents to 'third parties,' car, and driver of same, under a neat inclusive policy."

A MOVEMENT is on foot in Melbourne to form an Australian Motor Club.

THE Right Hon. A. J. Balfour has now received his new 7 h.p. light Panhard and Levassor carriage, for which he has been waiting so long. Mr. Balfour went out for a spin on the car last week with Mr. C. Jarrott at the helm, and he has since then covered over 150 miles, and is highly delighted with it. The car is painted dark olive green, edged with black and a fine white line and looks exceedingly smart; the brass-mounted levers and body and two brass Bleriot lamps also add to the smart appearance of the vehicle.

THE ALBION TONNEAU CAR.

THE accompanying illustration shows a 7 h.p. tonneau car, the latest production of the Albion Motor-Car Co., 169, Finnieston Street, Glasgow. The motor is petrol driven, and is of the two-cylinder horizontal balanced type. It develops 7 h.p. on the brake when running at the maximum speed of 700 revolutions per minute. It is fitted with an adjustable governor and, when desired, with an accelerator to increase the engine speed. The power of the engine is controlled by a variable expansion gear, by means of which the engine can be worked from zero up to full power, and the speed of the car regulated from a crawl up to top speed. The car has two forward speeds and a reverse motion, controlled by a single lever, the changes being obtained by a special arrangement of clutches and gear wheels always in mesh. The gearing is enclosed and runs in oil. The power is transmitted to the rear axle by one central driving chain. The ignition is electrical, the current being obtained from a magneto-generator of simple and reliable design. The wheels are of the artillery pattern, with hardwood spokes, and are fitted with solid rubber

THE ALBION 7 H.P. TONNEAU CAR.

tires. The Albion car appears to be meeting with success in Scotland, several users of the vehicles speaking enthusiastically of the results achieved with them.

A SERVICE of motor-cars has just been started between Sfax and Soussa, in Tunis.

THE French Budget for 1902 contains a proposition to collect from the refiners of petroleum spirit a tax of 1.50 francs per hectolitre.

IN Italy some successful experiments have been carried out with a new motor-car destined for railway protection in case of war. The car is armoured with Bessemer steel plates, is propelled by a 7 h.p. motor, and carries two Maxim guns, one fore and one aft. The total weight when ready for service is only 1,400 kilograms.

WE believe that the first instance in which electric carriages have been used on the occasion of a wedding occurred on the 8th inst., when Mr. W. R. Coleridge Beadon, F.G.S., of Oorgaum, S. India, was united to the daughter of Mr. Douglas E. Onslow, J.P., of Wood House, East Putney. The ceremony took place at Holy Trinity Church, Wandsworth, and after the usual wedding breakfast the happy pair were conveyed to St. Pancras in an electric brougham, which had been placed at their disposal by the City and Suburban Electric Carriage Company.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Spare parts for 8 h.p., 12 h.p., 16 h.p. PANHARD'S in STOCK, 100-104, Long Acre, W.C.

THE "BROWN" GOVERNED PETROL-MOTOR.

IN introducing the new petrol motor shown in the accompanying illustration, Messrs. Brown Brothers, Ltd., of Great Eastern Street, London, E.C., state that they have studied the prevailing opinion that the single-cylinder high-speed engine must give place to the slow-running double-cylinder governed engine of at least six brake horse power. The use of the new motor on a car of *tonneau* pattern, which should weigh between ten and twelve cwt., reduces the necessity of changing speeds at every small gradient, the engine having an ample reserve of power. When the clutch is used and the engine out of gear it does not race and cause inconvenience through excessive vibration. It is therefore much easier to handle in heavy traffic. As will be seen, the motor is of the double-cylinder water-jacketed type, giving six brake horse power at 850 revolutions, and by the use of the accelerator will work up to seven brake horse power. The governor gear is of the well-known Daimler pattern. All the working parts are thoroughly hardened

and carefully fitted. Special connections are provided for oiling the cylinder and other parts of the engine. Electric ignition fitted with means of advancing and retarding the time of sparking is adopted. The carburettor used with the motor is of special design; it has no float or any parts likely to get out of order, is supplied fixed to the engine, and only requires connecting to the petrol tank. The engine crank casing is made of aluminium, and is oil-tight. It is provided with lugs, so that it can be easily fitted to the frame of the car. The cylinders are of hard grained cast-iron, bored to gauge. The crank shaft is made from one piece of steel, machined all over, and the bearings are fitted with white metal. The valves are all easily removable for examination or regrinding. A heavy fly-wheel is provided, one side being coned for the friction clutch. The exhaust elbow is large, and provided with a flange for connecting up. The engine weighs complete 174lb., and its dimensions are:—Height over all, 2 ft. 6 in.; width over all, 1 ft. 3 in.; and length from end to end of shaft, 1 ft. 11 in.; and we may add that all parts of the new motor are made on the interchangeable system.

A PUBLIC trial of a Singer motor-bicycle was recently given at Cue, Western Australia, by Mr. Marshall, of the firm of Marshall and Forman, cycle makers, in that town. After running a few times up and down Austin Street, Day Dawn was visited. A crowd quickly gathered, as an automobile had never been seen in the district before.

CONTINENTAL NOTES.

BY "AUTOMAN."

CHARRON and one of his partners will leave Paris at the end of the present month for a trip to America, where it is intended to organise an automobile depot. It has been reported that Fournier and Tod Sloan were connected with this undertaking, but the rumour is entirely unfounded.

THE Belgian Automobile Tour has been abandoned. The matter was discussed at a meeting of the Touring Committee of the A.C.B., when it was pointed out that the projected tour had been already postponed on account of the Paris-Bordeaux and Paris-Berlin races, and that, the season being so far advanced, it would be wiser to put off the tour until the commencement of the next automobile season and to run it in connection with the exhibition.

THE Automobile Club of Flanders has just held a "Concours de Pronostics," which is a title rather difficult to translate, but which might be rendered most intelligible in English by calling it a "Say how quick you intend to travel race." The competition took place between Ghent and Blankenberghe, a distance of thirty-five miles, and the winner was the driver who the most nearly realised the speed at which he had declared he would travel. An observer was placed on each of the competing cars whose business it was to see that the driver employed no means except his own judgment for estimating the speed at which he was travelling. The winner was M. Hebblewick on a Delahaye, who estimated his speed at sixteen miles an hour and exactly realised his anticipations. A competition of this kind would be most useful in England and would save a great number of automobilists from having to waste their time in the police courts all through having so little experience in estimating the legal limit, and "Automan" most respectfully suggests a series of these competitions to be organised by the A.C.G.B.I.

MADemoiselle JEANNE LAUGA has the honour of being the youngest certificated and qualified *chauffeuse* in France. She is a born Parisienne and is only seventeen years of age; the other day she passed without any difficulty her examination before M. Douat, the Engineer of the Mines Department, prior to starting off to drive her parents for a tour in Auvergne.

THE dispute in Brussels about the automobile exhibition has unfortunately not yet been settled, and there is a strong likelihood that there will be two exhibitions next year—one organised by the Union Veloce and held in the Pole Nord, and the other organised by the Chambre Syndicale de l'Automobile and the A.C.B., and held in the Hall du Palais du Cinquantenaire.

ONE HUNDRED AND EIGHTY *chauffeurs* had to appear the other day before "their betters" in the police court of Sèvres, the picturesque little spot not far from Paris, on the banks of the Seine, and from whence comes the world-renowned porcelain which is known by the same name. They had to answer to the charge of furious driving. The magistrate's name was Clement, and the manner in which he tempered justice with mercy did not belie his good name, for most of the offenders got off with a fine of one franc and the costs, about four francs. The magistrates of country police-courts in England would do well to take a lesson, for in inflicting similar fines they would be doing their duty and at the same time not doing harm to a young national industry. It is surely a gross miscarriage of justice and a parody on common sense to fine an automobilist £5 and costs for exceeding the legal limit of speed on an open road in the country, and with not a soul in sight. It would be well if it could be pointed out to them that every time they fine in such an unreasonable manner when there is a perfectly harmless breach of the law they are hammering nails into the coffin of English industry.

THE motor-car is no respecter of persons, and no less a person than the mother of the Queen of Spain might have been seen the other day *en panne* on the Bréthencourt Hill, whilst on her way to Ourdan, in the department of Seine and Oise. After an hour's fruitless efforts a noble beast of burden had to be requisitioned to drag the royal car to its destination.

It would be perhaps a good thing for the world at large if there could be a law against vested interests, that terrible opponent to everything new and improved. Here is poor Switzerland, "a free Republic," thinking it is going to turn back the hands of the clock of progress and prevent the automobilist from passing over its mountain roads, and all because of the loss there might be to those whose business it is to hire horses and carriages to the traveller. A correspondent of *La Locomotion Automobile* tells how he was stopped on his motor-bicycle and absolutely refused permission to proceed. It is to be hoped, however, that before long the hotel-keepers will realise that this stupid legislation is taking motorists to other districts and then we shall hear quite another story.

At the time the *Journal* was going to press last week, and too late for publication, the courageous young Brazilian, M. Santos-Dumont, was making another attempt to win the prize offered by M. Henri Deutsch de la Meurthe. At the start he noticed a slight leak, but considered that his task was so simple that a little loss of hydrogen would make no matter. Amidst immense enthusiasm, he doubled the Eiffel Tower in nine and a half minutes. In coming back, however, against the wind, and when nearly half way home, the leak became more serious, and the envelope of the balloon and some of the stays flapped against the propeller; the stays tore away the eyelets, thereby increasing the leak. M. Santos-Dumont was obliged to stop the propeller, which, of course, caused the balloon to sink towards the earth, and in descending the envelope caught against the sharp corner of a building and was ripped open. The courageous aeronaut received no injury and is hard at work on his No. 6, which he hopes to have out before the middle of September in order to win the Deutsch prize, which has been so nearly within his grasp.

THE hill-climbing contest which took place under the direction of the Automobile Club Dauphinois last Sunday deserves a special mention. I visited the place where the course was fixed some five years ago, toiling up the hill in a "savin." Vizille, the starting point, is an old-world town situated at the foot of the Alps, just where the lovely rolling, fertile country of the grain land of France changes for the rugged frontier of rocky mountains, which tower in the background snow-capped. For four miles there is a wide straight road, and a steady incline of $9\frac{1}{2}$ per cent. No better spot could be found anywhere for such a contest. The best time in the event was made by M. Kraeutler, who, in a 16 h.p. car, covered the distance of 6½ kilomètres in 7min. 2sec.

ACCORDING to reports, Mr. W. K. Vanderbilt's new Mercedes car, the "Red Devil," the successor of the "White Ghost," has been tested for its greatest speed and has developed an average of seventy-four miles an hour.

THE Scarborough and District Motor-Vehicle Syndicate (Limited) has been registered with a capital of £3,000, to construct, purchase, and work omnibuses and vans, appropriate for the carriage and transport of passengers and goods, etc.

THE other day we had an opportunity of inspecting, at Messrs. Hewetson's dépôt in Tottenham Court Road, W., the identical 10 h.p. Benz *tonneau* on which Mr. Ballin Hinde recently made a 700 miles tour from Cannes to Frankfurt, over the Lower Alps. The car looks none the worse for the work it has done.

EXPERIMENTS have recently been conducted by the post office authorities at Syracuse, N.Y., U.S.A., with a motor-tricycle for the collection of mails. Collections have been made from fifty-four city letter boxes in one hour and ten minutes, instead of in three hours, the time ordinarily taken in collection by horse-drawn vehicles.

THE LATIL FRONT-DRIVING VOITURETTE.

M. LATIL, of Boulevard Rabatau, Marseilles, France, has recently introduced a new voiturette in which the motor and transmission gear are located close to and connected with the front axle, forming an *avant-train*, which can, it is claimed, be fitted to any horse-drawn vehicle with but little alteration. The motor—an Aster vertical water-cooled engine of $3\frac{1}{4}$ h.p.—is supported in front of the forward axle; it drives

FIG. 1.—GENERAL VIEW OF CAR.

through the medium of a pedal-operated friction clutch, an extension of its crank shaft, on which is mounted a series of spur wheels, any one of which can be brought into mesh with corresponding pinions on the front axle, three speeds forward being provided for. The body of the little car is comfortably suspended, and is adapted to seat three persons. Inclined wheel steering is adopted, the maker claiming that the steering of the vehicle is not rendered more difficult by reason of the fore axle performing the double function of steering and driving. The various taps controlling the engine are grouped around the steering column, while the change-speed lever is placed within easy reach of the

FIG. 2.—ELEVATION OF "AVANT TRAIN."

driver's right hand. The car can, it is claimed, attain a speed of twenty-five miles per hour on the level, and ascend gradients of one in eight at six miles per hour. It is claimed to be very free from vibration, and by reason of its low build exceedingly stable. Ample brake power is provided, a pedal operating band brakes on all four wheels being available. The weight of the little car complete is between 4 and 5 cwt. M. Latil is also making an *avant-train* voiturette on similar lines, but fitted with a 5 h.p. Aster motor.

THE NEW PANHARD FRICTION CLUTCH.

THE new friction clutch recently introduced by the Panhard-Levassor Company consists essentially of a male cone, having a loose fit on the shaft which it drives, and capable of sliding on it to engage with a female cone under the action of a spring. In the friction-clutches of this type now in use the male cone is fixed to the shaft, and the whole, both shaft and cone, must be shifted; consequently as soon as the cones commence to engage the shaft begins to rotate. The resulting "moment" is transmitted from the shaft to the sleeve carrying the pinions. As at this point the lever arms of the "moment" are very short there is a great friction between the shaft and the sleeve which must be overcome in completing the engagement of the cones.

In the new clutch the shaft is not displaced, but instead a central rod fastened to the male cone. The relative displacement of the shaft is secured by means of brackets or driving pins engaging freely into openings at the end of lever arms forming an integral part with the shaft. As these driving pins are near the circumference of the cone the frictional resistance which they may offer to the lateral motion of the cone is slight, and the operation of clutching is therefore effected without difficulty.

The accompanying illustration shows a longitudinal section through the clutch. The smaller views are cross-sections through A B, C D and E F, respectively. The motor shaft *a* carries the

fly-wheel *b*, provided with a cavity *c*, and forming the female cone. The male cone *d*, provided with a leather lining *e*, is mounted loosely on the shaft *f*, which latter, on a square portion, carries a sliding sleeve *g*, on which are fastened the pinions *h*. The cone *d* is longitudinally movable on the shaft *f*. Its hub *i* is connected to a rod *j* within the shaft *f* by means of a peg *k* passing through a cut-out of the shaft. The peg *k* has some lateral play in this opening. The shaft *f* is provided at its end with a plate *m* carrying two arms *n* drilled near their extremity with holes to receive the driving pins or bolts *o* fastened to the cone *d*. In this manner the arms *n* are driven by the cone without hindering the displacement of the latter on the extremity of the shaft *f*.

When the clutch is to be engaged to connect shafts *a* and *f*, the spring *r* is allowed to act on a slide *p* moving in a cylindrical opening *q* and pushing against the head *r* of rod *j*. The latter displaces cone *d*, which enters into the conical cavity *c* under the pressure of peg *k*. Cone *c* then drives cone *d*, and the latter in turn drives shaft *f* through the intermediary of bolts *o* engaged with the arms of the lever *n* fixed on the plate *m* carried by the shaft *f*. This shaft not requiring any longitudinal movement, there is no objectionable friction between it and the pinion sleeve, and a perfect engagement of the clutch is made possible.

MR. HENRY GARDNER, of Hospital Street, Nantwich, stocks Pratt's motor-spirit, greases, and lubricating oils, and other sundries for motorists.

THE CONDUCT OF MOTOR-CAR TRIALS.

IN the case of automobile competitions which are not intended to be speed contests there is always more or less difference of opinion as to what should constitute the basis of judging the competing vehicles and making the awards. The aim of all these trials or tests is, of course, to bring to the fore the most reliable and serviceable vehicles. While the end in view is thus clearly defined, and while exceptions to it are hardly to be expected, the best means of attaining it are less obvious. As a consequence, there is always a good deal of discussion before deciding upon the conditions of a contest, and here and there a protest after the contest is over. It would seem, remarks a writer in the *Horseless Age*, to be well, on the one hand, in judging the performance of vehicles, to take into account only such points as are capable of absolute determination, such as number of breakdowns *en route*, time consumed in covering the distance, etc., and leave out of consideration all points which can be expressed only in relative terms.

While such a standard would have the advantage of simplicity and ease of application, it would not give all the information about the vehicles that prospective users might desire. In the first place, the period of the trial should represent only a comparatively small fraction of the life of the vehicle, and as it is self-evident that only new, or practically new, vehicles are entered in the more important events at least, the vehicles at the termination of the trial should still be in good working condition, capable of many miles more. This is a point which ought to be considered in drafting the conditions of such trials—the condition of the different vehicles at the end of the contest. To investigate every part of a motor vehicle and judge its condition of wear is not an easy matter, of course, but a report giving information on this point so much enhances the value of an endurance test that it is well worth the trouble it causes. In order that work of this nature may be reliable, competent engineers must be entrusted with the examination of the vehicles and the drafting of the report.

When endurance tests are made to include this feature they will be a means of education, not only of the general public who may chance to witness the trial, but of those more directly interested who wish to form an opinion of the serviceability and durability of different types of vehicles.

A COMPANY has just been formed at Verviers, Belgium, with a capital of £8,800, and with the title *La Société des Automobiles Ruhl*.

ON the way to Ockley the other day we came across a sign-board near Holmwood bearing the legend, "Motor-cars and traction engines not allowed along this road. By order!"

AMONG recent purchasers of Locomobile steam cars are Lord Dudley, Sir Edward Cassel, Sir Hervey Bathurst, and the Hon. H. Bathurst.

THE British Automobile Commercial Syndicate has received a second order from the Duke of Sutherland, for a 12 h.p. Panhard car, the body of which is to be built in the style of a shooting brake.

WE learn that Mr. W. Hemingway, Assoc.M.Inst.C.E., has been appointed head of the testing department and chief draughtsman and designer at the works at Coventry of the Daimler Motor Company, Limited. Mr. Hemingway is a practical engineer, and has in recent years been prominently connected with the development of the chainless bicycle.

MESSRS. FRISWELL, LIMITED, ask us to state that, as it appears from considerable correspondence that many people have an idea that they carry on auction sales at 48, Holborn Viaduct, E.C., their show rooms at Holborn Viaduct are devoted entirely to new carriages, and that the premises at 1, Prince's Road, Holland Park, lately occupied by the Automobile Association, are kept entirely for receiving and selling private individuals' cars, either privately or by auction.

HERE AND THERE.

DR. HOOD, of Blirgowrie, N.B., is now going his daily rounds on a Singer motor-bicycle.

THE big Panhard car driven by M. Leys, in the Paris-Berlin race, has been acquired by Lord Carnarvon.

THE five days' tour of the Pyrenees, organised by the Bordeaux Automobile Club, starts on Wednesday next, the 21st inst.

PROFESSOR H. S. HELE-SHAW, of University College, Liverpool, has fitted a water-cooled head to the motor of his New Orleans voiturette, with satisfactory results.

THE Organising Committee of the Automobile Club de France have fixed December 10th to 25th as the date of the next French Salon d'Automobiles, which will again be held in the Grand Palais in the Champs Elysées, Paris.

IN a recent issue we mentioned that Mr. E. Collins, of Coventry, was acting as agent for the Werner motor-bicycle in the county of Warwick. Mr. Collins writes asking us to mention

CALLING in at the depot of the Auto-Carriage Company, Ltd., in Great Portland Street, W., the other day we had an opportunity of inspecting a 6 h.p. Bardon car which went successfully through the tour between Paris and Berlin recently. We understand that the car is entered for the forthcoming Glasgow trials.

At the last meeting of the Farnham (Surrey) District Council, Mr. Lewis asked what power the Council had to control the speed of motor-cars passing through the town, which were a great source of danger. The chairman said it was a matter for the police, and at the next bench there were several cases coming forward.

ENTRIES for the mile speed contest on the beach at Deauville, France, on September 1st are coming in apace. Already over twenty competitors have entered, including Girardot, Lemaître, Serpollet, Cormier, Théry, Demester, Bardin, and Osmont. It is also reported that an entry has been received from Mr. S. F. Edge, who will drive his big Napier car.

THE International Motor-Car Company, Limited, of 76, High Street, Marylebone, London, W., have sent us a copy of a new illustrated catalogue they have just issued, in which full

THE IMPERIAL LIGHT CAR WITH SPIDER BODY. 1. (For description see page 433, ante).

that his ground covers the whole of the North of England and North Wales.

DURING the manoeuvres at Aldershot last week General Goldie and another officer were driven about in a 3½ h.p. Hewbenz Victoria, supplied by Mr. A. E. Major, of Broad Street, Reading. During one of the days Hind Head Hill was climbed, the little car going through the ordeal without a hitch.

It is announced that the Daimler Motor Co., of Coventry, will shortly be bringing out a light 7 h.p. car with a two cylinder motor, direct central drive instead of chains, and the usual tonneau body. Three forward speeds and a reverse will be fitted, as well as both tube and electric ignition.

A DISCUSSION took place at the last meeting of the Islington Borough Council on the question of road maintenance, when Mr. Alderman Tomkins pleaded for an increased expenditure in this direction, so that several defective roads might be put in proper condition. The amendment for an increased sum, however, was lost.

particulars and clear illustrations are given of the "Charette" in its several forms. Several pages at the end of the list are devoted to copies of testimonials from users of this car, which appears to be giving very good results.

THE Ormonde Motor Company, of Wells Street, Oxford Street, offer a long list of attractions to all who may be disposed to buy their cars, submit their own to overhauling and repairs, or store them with the company. Mr. Arthur Goodwin, who has been connected with the industry for several years, is in charge, and we understand that thoroughly experienced mechanics are in attendance.

IN our issue of the 3rd inst. we announced that the Electricity Committee of the Manchester Corporation had resolved to purchase two motor-cars for the use of outdoor officials in visiting sub-stations. We now learn that the Corporation Electric Department have placed an order for two Locomobile steam cars with Messrs. Bennett and Carlisle, Limited, of Exchange Arcade, Manchester.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Spare parts for 8 h.p., 12 h.p., 16 h.p. PANHARDS in STOCK, 100-104, Long Acre, W.C.

It is probable that the War Office will make several reforms as a result of the recent Aldershot manœuvres. Major-General Douglas is quite convinced of the practical utility of cyclists in active warfare, and his report will contain special reference to the possibilities of the cycle in time of war. It is highly probable also that a corps of motorists will be suggested as a useful adjunct to any cyclist section.

WHILST driving with a lady in a motor-car on the Parade at Southsea, Mr. Hewetson unsuccessfully attempted to avoid a dog which got under the vehicle, with the result that it turned over on its side, throwing the occupants on to the road. Mr. Hewetson escaped unhurt, but was badly shaken. The lady, however, sustained several bruises on her face as well as a severe shaking. The motor-car was seriously damaged.

QUITE a number of the large Coventry cycle-making concerns are now taking up the construction of motor-bicycles. In addition to the Singer Cycle Company, and Messrs. Bayliss, Thomas, and Company, Limited, who have been making them for some time, we hear that the Rover Cycle Company, the Sparkbrook Cycle Company, and also the Rudge-Whitworth Company, are each preparing to put a motor-bicycle on the market.

DR. J. HUNTER, Corran, Lochgilphead, N.B., who has been using an "Argyll" voiturette for some time, is very enthusiastic. He states that he has not yet come across a hill which the car will not mount, notwithstanding the very hilly country in which it is used. At first he had trouble with the brakes, but since wire ropes with wooden blocks were fitted he runs down any hill with absolute confidence. Dr. Hunter adds that he finds the car of the greatest use and far in advance of a horse-drawn vehicle, especially in long journeys.

"PETROMOBILE" STEAM CARS.

A FURTHER addition to the list of useful road maps suitable for motorists, which have of late years been produced in such abundance, is that of the environs of London, issued by C. Smith and Son, of 63, Charing Cross, S.W. The map is clearly printed upon cloth, and folds up into a neat case for the pocket. It is on a scale of two miles to the inch, and takes in Maidstone, Chatham, and Chelmsford on the east, Tunbridge Wells and Godalming on the south, Farnham and Henley on the west, and Hertford on the north. The main and principal cross roads are coloured, and the bye roads clearly defined. Metropolitan motorists who require a reliable and handy guide for short excursions in every direction will find this map a useful publication.

THE new car recently completed by the Kingsburgh Motor Construction Company, Ltd., of Granton, Edinburgh, has been designed by Mr. A. J. Drake for public work and to carry twelve passengers. The total weight of the vehicle is $27\frac{1}{2}$ cwt., but we understand that this will be reduced in future cars by the use of aluminium. The vehicle is fitted with a 12 h.p. petrol motor of special design for this class of work; special attention has been given to all the wearing parts, and at the same time a considerable amount of complication has been entirely done away with. The car has been thoroughly tested and driven over 1,000 miles with the greatest of satisfaction, and the company are confident that they are now able to place a thoroughly reliable public service vehicle on the market.

THE WAR OFFICE MOTOR VEHICLE TRIALS.

CAPT. LLOYD, R.E., secretary of the War Office Committee on Mechanical Transport, has issued a circular letter to various local authorities concerned on the subject of the proposed trials of self-propelled lorries for military purposes. Capt. Lloyd states that the Committee have now chosen the following routes for the proposed trials:—

1. Aldershot, Hale, Odiham, Hartley Row, Hartford Bridge, Blackwater, Bagshot, Chobham Ridges, Frith Hill, Frimley Green, Farnborough Station, and back to Aldershot.

2. Aldershot, Farnham, the Hog's Back, Guildford, Worplesdon, Bisley, Donkey Town, Bagshot, and back to Aldershot.

3. Aldershot, Aldershot Station, Ash, Wyke, Puttenham, Peper Harow, Milford, Hindhead, Tilford, Farnham, and back to Aldershot.

4. Aldershot, Hale, Odiham, South Warnborough, Alton, Farnborough, and Aldershot.

5. Should it be decided to make the journey from Aldershot to Chatham, the route will be from Aldershot to Farnham, Guildford, Merrow, Gomshall, Dorking, Reigate, Redhill, Westerham, Seal, Brough Green, Leybourne, Ditton, Maidstone, and Horsted, to Chatham.

Capt. Lloyd states that the routes have been chosen so as to avoid, as far as possible, covering the same ground many times, whilst they traverse some of the steepest gradients in the districts, and also lead over both main and second-class roads, so that the vehicles can be tested under various conditions. It is anticipated, he proceeds, that no lorry, when fully loaded with fuel, water, and carried load, will weigh more than seven tons. This weight will probably be borne on four wheels, and the driving wheels, on which the greater portion of the weight, say five tons at the outside, will be borne, must, by the conditions of the competitions, be at least 9 in. wide across the tires. The trailers, which may possibly be two-wheeled vehicles, are not likely to weigh, when fully loaded, more than $3\frac{1}{2}$ tons. The number of vehicles competing is at present estimated at between twenty and thirty, though it is possible that a smaller number may eventually be brought to the trials. Arrangements will be made that the roads shall not be unduly blocked by the vehicles following one another in close processions, and long intervals will be maintained between competitors.

Capt. Lloyd states that the War Office had written to the Secretary of the Local Government Board asking that facilities might be granted to make these trials. The Local Government Board has replied suggesting that in the first instance local authorities having control of the roads along the proposed routes should be communicated with in order to avoid any risk from the passage of such heavily-laden vehicles over bridges which might be weak and might require strengthening. The Committee has therefore addressed a letter to such authorities expressing the hope that there will be few, if any, places along the routes chosen over which such moderate loads cannot be safely borne. They further ask the local authorities to give them every facility for carrying out these most important trials, and should the nature of the roads chosen render objection necessary, they ask that alternative routes may be suggested.

COUNT BOOS-WALDECK, an Austrian motorist, recently made a trip from Vienna to Ostend in a 20 h.p. Austrian Daimler in $5\frac{1}{2}$ days. The distance covered was 875 miles.

THE United Motor Industries (Limited), of 40, Holborn Viaduct, E.C., have just issued a very exhaustive list of genuine De Dion-Bouton parts and fittings, which is well worth asking for. We note that in many cases prices have been materially altered in the buyer's favour.

THE Anglo-American Oil Co., Limited, have just issued a new edition of their valuable list of agents stocking Pratt's motor-spirit. The list, which is of a handy size, is steadily assuming big proportions as regards the number of places where spirit is stored. Motorists using Pratt's should obtain a copy of the booklet.

SERIOUS MOTOR-CAR ACCIDENT.

A SERIOUS motor-car accident occurred on Sunday afternoon near Doncaster, the victims being Captain Laycock, of Wiseton Hall, Bawtry, and two friends, Captains Craddock and Wilson, who, along with a French servant named Gaulard, were riding, it is understood, to York, being on the way to Scotland for the grouse-shooting season. A passing cyclist was also involved in the accident. The scene of the disaster was a point near the Red House Farm, about five miles from Doncaster, where the road diverges, one branch going to Leeds and the other to York. There is here a very steep gradient, and it was in descending this that the party came to grief. Captain Laycock was in charge of the car—a 24 h.p. Panhard—and, according to reports, he lost control of the vehicle, and after passing and overthrowing a cyclist it ploughed up the grass at the side of the road, toppled over, and righting itself again, turned round with its head towards Doncaster. The occupants of the motor-car were, of course, thrown out, Captain Laycock being found under it. Mr. T. Swallow, of Doncaster, who was driving, had been passed by the car a short distance from the scene of the accident, and on arriving there he found all the party more or less stunned and helpless. Captain Craddock was most seriously injured, being unconscious, and, as afterwards proved, he was suffering from concussion of the brain and other injuries which almost precluded hope of recovery, although later reports are slightly more favourable. Captain Laycock's collar-bone was broken, his elbow fractured, and his right thigh injured, and he had many bruises. Captain Wilson, the third passenger, had a leg broken, while the servant escaped with a few bruises. Mr. Swallow left his wife and daughter, with whom he had been driving, and went to Doncaster for medical and other assistance, and on the way he met Superintendent Blake, of the West Riding Police, who went to the place to render aid, whilst Mr. Swallow sent two or three cabs forward, several doctors, and a nurse. Meanwhile Mrs. Swallow had obtained water from the Red House Farm and bathed Captain Craddock's head and endeavoured to bring him to consciousness. Assistance was soon at hand, however. Three medical men arrived from Hooton Pagnell and four from Doncaster. Dr. Goode and another gentleman remained with Captain Craddock pending the arrival of Dr. Robson, of Leeds, who was sent for by telegram. Captain Laycock and Captain Wilson were taken to the Doncaster Infirmary and afterwards to Wiseton Hall, but Captain Craddock remains at Red House. The cyclist who was thrown was a young man from Castleford named Edward Chas. Pope. He was pitched into the hedge and sustained several bruises.

From Mr. Swallow we learn that the car passed him about four hundred yards from where the accident occurred, and at the time of the accident would not be travelling at more than sixteen to twenty miles an hour. He adds "Captain Laycock told me that the gearing of one of the back wheels went wrong, which was the cause of the accident. Not being more than two hundred yards away at the time, and having heard many false reports, I can say that it was a pure accident, and no fault whatever of either the cyclist or the occupants of the car."

THE METROPOLITAN MOTOR MANUFACTURING COMPANY.

THE petition of A. E. Creese for the compulsory winding up of the above company was heard last week. Mr. Edmonds said it was a creditors' petition, and there was a voluntary liquidation pending. Mr. Williams, for the liquidator, said the petitioner was the vendor to the company, and it was alleged that he had practically ruined it. The company under his management had only produced two motors, and these would not work, and could only be sold for scrap iron. His lordship said there was evidence of considerable irregularities, but he thought the voluntary winding up would satisfy the shareholders, and he dismissed the petition, but without costs.

THE MERCERS' COMPANY v. THE BRITISH AUTOMOBILE SYNDICATE AND THE AUTOMOBILE AGENCY.

MR. JUSTICE KEKEWICH, sitting in the Chancery Division of the High Court of Justice, on Thursday last, had before him motions in an action, which was brought by the Mercers' Company to restrain infringement or breach by the defendants of a covenant contained in a lease under which they respectively held certain premises in Long Acre. The defendants are two motor-car companies occupying premises in Long Acre, the Syndicate at 97 and 98, and the Agency at 100 and 104. Mr. Warrington, K.C., said the complaints made by the plaintiffs, who are large owners of property in Long Acre, was that the defendants had broken a lease against carrying on trade, which increased the fire insurance premium, and the evidence was that the defendants stored cars with petroleum, and that occasionally the petroleum got spilt, which was a source of danger and annoyance. Another ground of complaint was caused to the plaintiffs' tenants by the cars coming in at all times of the night to be "prepared." The learned counsel wanted an undertaking that the defendants should pay an increased fire insurance premium. Mr. Renshaw, K.C., said that his clients, the Agency, were already doing that. Mr. Buckmaster, on behalf of the Syndicate, said that he was not prepared to give any undertaking. Mr. Warrington asked the Court to fix an early day for the hearing of the action. After some discussion, his Lordship appointed the 5th of November for the hearing.

FURIOUS DRIVING CASES.

At Chelmsford, Count Zborowski, of Garboldisham Manor, East Harling, Norfolk, was charged with driving a motor-car at a speed greater than twelve miles an hour between Widford and Ingatestone. The police officer at Widford noticing that defendant was riding very fast, telephoned to Ingatestone, where he was stopped. It was then found that he had travelled 4 miles 5 furlongs 100 yards in 11 minutes, which was at the rate of 25 miles an hour.—The defendant was fined £5 and £1 2s. 6d. costs.

At Chelmsford, William Fenton motor-car driver, of Commercial Road, London, was fined £5 and £1 5s. 6d. costs, for travelling at the rate of 17 2 5 miles an hour, near Ingatestone.

At Farnham Petty Sessions, Count Seilern, who has taken a residence at Frensham Place, near Farnham, for the season, and who did not appear, was summoned for driving a motor-car at excessive speeds at Farnham and the Bourne on July 30 and 31. The police having given evidence, a witness, an architect, said he had timed the defendant from the witness's place to the lodge at Frensham Place, the distance being half a mile, and the defendant did the journey in one minute, giving a speed of thirty miles an hour. The Bench said both cases were very bad, and for each the defendant was fined £5 and costs.

At Barrow, Leon Vint, proprietor of a touring entertainment combination, was summoned for furiously driving a motor-car when in Abbey Road on August 6th. P.C. Willan gave evidence that the car was being driven at a rate of a little over thirty miles an hour. Several witnesses supported the constable's testimony. A fine of 40s. and costs was inflicted.

At Steyning, H. Ramoisy, of London, was summoned for driving a motor-car at Southwick at a pace exceeding twelve miles an hour on Sunday, 28th July. He pleaded not guilty. Mr. Richard Dawes represented the defendant. P.C. Bristow stated that about half-past four on the afternoon in question defendant came along the road leading from Southwick to Fishersgate. He received a signal from P.C. Dowling of the coming of the motor-car, and timed it for a quarter of a mile. In consequence of the pace he held up his hand for the driver to stop. He then drew the attention of the defendant, who was in the car with three others, to the time in which he had covered the 440 yards, namely, 43 2-5th sec., or at the rate of over twenty miles an hour. Defendant replied that he could not possibly go more than eighteen miles an hour, and said that he didn't think he was going more than twelve or thirteen. Defendant, who is employed by the Auto-Carriage Company, stated that he had had ten years' experience of driving motor-cars. There were four gears, and he was using the third, which enabled him to go fifteen miles an hour. He was not going at a rate exceeding twelve miles. The wind was against him. By Mr. Powell Breach: The speeds accounted for nothing when going down hill, but there was a slight rise and not a fall. The Bench gave him the benefit of the doubt, and cautioned him that under no circumstances must he travel at a speed exceeding twelve miles an hour.

At Leek, Thomas Bolton, J.P., Lightoaks, Cheddle, Staffordshire, and Francis Bolton, Moor Court, Oakamoor, were charged with driving motor-cars on June 29th at a greater speed than twelve miles an hour, and also with driving at an improper pace, having regard to the traffic. Witnesses said that one of the cars was going at the rate of thirty miles an hour and the other at from eighteen to twenty miles an hour. Francis Bolton said it would be impossible to travel at the rate of thirty or forty miles an hour. Thomas Bolton, who did not appear, was fined £3 and costs, and the case against Francis Bolton was dismissed upon payment of costs. The first charge was withdrawn.

At the St. Neots (Hunts) Police Court, Mr. J. W. Hornsby, J.P., of Barrowby Hall, Grantham, and Mr. F. Driffeld, of Kettering, were each fined £5 for driving motor-cars at more than twelve miles an hour on the North road. Mr. Hornsby was stated to have travelled between twenty to twenty-five miles an hour, and Mr. Driffeld at thirty nine miles an hour.

At Aylsham Petty Sessions Mr. J. R. Hargreaves, of the Manor House, Cawston, was summoned by Superintendent Palmer for driving a motor-car on the highway at Cawston at a greater speed than twelve miles an hour on July 18th. Mr. Reeve (Mills and Reeve, Norwich) appeared for the defendant. From the evidence it appeared that on the date named at about midnight, Mr. Hargreaves was driving his motor-car with three other occupants, at about eighteen or twenty miles an hour. A Cawston postman named James Duffield was driving along the road at the same time, and met the motor-car, and fearing a collision he shouted to Mr. Hargreaves to stop, but the motor-vehicle rushed on, and caught the hub of the cart, and the postman was thrown out. The magistrates imposed a fine of £7 10s., and 17s. costs, or in default one month hard labour.

At Acock's Green, Charles Leonard Lowe, of Mossley, was summoned for driving a four-wheeled motor-cycle at an excessive speed. Inspectors Griffin and Hill said it was going along Soney Lane at quite twenty miles an hour, and on turning round the corner of Woodstock Road, it narrowly escaped being upset. There were several cyclists about, one or two ladies having either to drop off their machines or to ride on to the footpath to avoid a collision. Defendant, who denied that he was going at the speed mentioned, was fined £2 and costs.

At the Bettws-y-Coed Petty Sessions, Geo. Thornton, driver of a motor-car belonging to Mr. LeVillie, proprietor of the "La Poupee" Company,

pleaded guilty to scorching at the rate of about twenty-five miles an hour along the road. Mr. Wright, of Messrs. Ayrton, Radcliffe, and Wright, solicitors, Liverpool, appeared for the defence, and stated his client had travelled nearly all over England, but had never been brought up before. P.S. Breeze proved the case, and stated that Thornton refused to give his name and address when asked. Colonel Johnstone said there was always extreme difficulty in catching those gentlemen, who were not only a nuisance, but a danger to pedestrians and animals, and the only chance they had of putting a stop to them was by inflicting the full penalty of £5 and costs.

At the Preston County Police Court, Thomas Walmsley, a motor-car proprietor, of Preston and Barton, was summoned for furiously driving a motor-car along Garstang Road, Fulwood, and thereby endangering the lives and limbs of passengers. From the evidence it appeared that on the morning of July 17th two police officers saw the defendant driving his motor-car at a furious rate, and timing him by means of a stop watch found that he covered a distance of 480 yards in exactly thirty seconds. This was equal to a speed of thirty-three miles per hour. For the defence it was submitted that the machine which the defendant was driving could not possibly be driven at the speed mentioned by the officers. A fine of 20s. and costs was imposed.

The Hon. Leopold Canning, of Garvan, Londonderry, was summoned before the Hunts Divisional Bench for driving a motor-car faster than twelve miles per hour, at Little Stukeley, on the 10th July. Defendant did not appear. P.C. Bailey said he saw a motor-car coming down the hill into Little Stukeley at a furious rate. Witness signalled for the driver to stop, and he having done so, witness told him he was going too fast. He travelled 1,306 yards in 1 min. 45 sec., or nearly twenty-five miles per hour. He said he saw the road was clear, and wanted to get up the hill. He asked witness to look over it. He gave his name and address, and afterwards drove on towards Huntingdon at a furious rate. Joseph Yates, postman, of Stukeley, gave similar evidence. A fine of £5 and 8s. costs was imposed.

At Droxford Petty Sessions, Mr. Charles C. Dallas, of Eastley, Wootton, Lynton, was summoned for driving his motor-car to the common danger of a certain passenger on the highway. The summons came on for hearing on the 8th inst. The complaint was laid by the Superintendent of Police, and it was alleged in support of the information that Mr. Dallas drove through the village of Hambledon at a speed varying, according to the testimony of the witnesses, from fourteen to twenty miles an hour. One witness stated that the car went by at such a terrific rate that his horse, which was tied up to the wall of a public-house where he was delivering mineral waters, stripped its headgear and bolted, before doing which it plunged about to such an extent that it knocked him down. As a result of the injuries which he had received he had been confined to his bed for five weeks. Mr. Staplee Firth defended, and elicited from this witness in cross-examination that at the time when the motor-car first approached he was inside the public-house, but he got outside while the car was still fifty or sixty yards away, and at the time the car passed the house he had hold of the horse's head. He admitted he did not put up his hand to stop the car. A letter was also put in from the driver's employers requesting compensation for the driver's injuries from Mr. Dallas. The case was dismissed.

At the Guildford Borough Bench, James Edward Lawes, cycle manufacturer, of Aldershot, was summoned for having recklessly driven a motor-car in Guildford, on July 31st. Mr. Norman Clinton, of Aldershot, appeared for the defence. Herbert Powell, J.P., of Piccadilly, said about 6.45 p.m. on Wednesday, July 31st, he was being driven out of the railway station gates in a two wheeled trap, taking the direction of Park Street. Suddenly, at the junction of the Station Approach and Farnham Road, a motor-car flashed round the corner from Farnham Road. The car swerved sharply to the right, passing within a foot of his horse's fore-legs, and the coachman was obliged to pull the horse on to its haunches. The motor-car was drawn up on the opposite pavement, just in front of the Napoleon public-house. Witness jumped out of his cart and asked the driver of the motor-car for his name and address, which he refused. After some altercation defendant's companion suggested he had better give a name. He did not think the car was going less than eight or more than ten miles an hour. He himself never turned the corner in question except at a walking pace. By the Mayor: It was when he had got into the difficult predicament that the motor driver did the only thing he could under the circumstances, but he considered that it was the most reckless piece of fancy driving he had ever seen. Dr. Powell's coachman gave similar evidence. Defendant said when he got to the bottom of the hill he was coming very slowly, not more than three or four miles an hour. Just then there was a wagon on the left side and a dog-cart coming at a sharp pace on the right-hand side. In order to avert an accident, he put on pace and went across the road into the lane near the Napoleon. He expected the occupant of the trap to come and thank him for having averted an accident. Instead of that he came up in an insolent way and demanded his name and address. The Mayor said the magistrates were satisfied that under the circumstances, and in view of the amount of traffic there, the defendant was going at an unreasonable rate, and he would be fined £1.

At the Croydon Petty Sessions, Frederick Bond, of Earl's Avenue, Folkestone, was summoned for driving his motor-car at a greater speed than twelve miles an hour in the parish of Addington, Surrey. The police swore that Mr. Bond was driving furiously and was going at the rate of twenty-five miles an hour. Other witnesses were called to give similar evidence. Ultimately the Bench dismissed the case. Mr. Staplee Firth defended.

At Guildford, C. A. Williamson, of Sand and Ripley, was summoned under the Light Locomotives Act for furiously driving a motor-car. A letter was read from Messrs. Firth and Co., dated the 2nd of August, stating that Mr. Williamson had only received the summons the day before, and they, therefore, applied for an adjournment for a fortnight, in order that that gentleman might prepare his defence. The application was granted, and the chief witness, William John Honey, was allowed £1.

At Chertsey Petty Sessions, Count Seilern, Frensham Place, Farnham, was summoned for driving a motor-car at an excessive speed, at Egham, on July 31st. The Count wrote to say that, as the summons had only been served on him the previous day, he would like an adjournment. This was granted.

At Maidenhead, Ernest Hannell, of Wargrave, appeared in answer to a summons for having driven a motor-car on the Bath Road, on August 1st, at a greater speed than twelve miles an hour. He pleaded not guilty. P.S. Day, of Littlewick, said that on August 1st, at 3.15, he saw defendant driving a motor-car near Knowl Hill Church. He timed it from the Bell and Bottle to the church—a distance of 594 yards, and it was going at the rate of 37 miles an hour. He received complaints from two persons respecting the defendant; one was of his having run over a dog. Defendant said that he had driven a motor-car for three years and had never been summoned before for going at a fast rate. It was impossible for the car that he was driving to go at thirty miles an hour, for it was only geared up to 25 miles an hour. He was only travelling at 12 miles an hour. Defendant called Frederick Brown and Frederick Rathbone, who stated that when they saw defendant on that afternoon he was travelling slowly—that was when he was at Wargrave. Superintendent Dorrell said that the Chief Constable had received complaints about the defendant, and several persons at Wargrave had also complained of his driving the motor-car at a fast speed. General Thompson said that as complaints had been made before respecting him, and as from the evidence before them there was no doubt that he was going at a rate of 30 miles an hour, it was useless to say that he was only going at 12 miles an hour. Defendant would have to pay a fine of £5, with £1 2s. 6d. costs.

A TECHNICAL OBSTRUCTION.

At Hove Gerald Hanson was summoned for obstructing the thoroughfare in Grand Avenue, Hove, by leaving a motor-car there on July 30th. Defendant pleaded not guilty. P.C. Williams said at 12.30 midnight he saw the motor standing in Grand Avenue. There was no light on the vehicle, and when its removal was attempted it was found to be locked. The car remained there until six o'clock in the morning. Defendant said he did not dispute that the motor-car was there, but denied that he had committed any obstruction. During the journey which he had made that night the car broke down, and he could hardly get it along on the last mile. When he got it to the door of his house in Grand Avenue he could not move it. His stables were in Norton Mews at the bottom of Grand Avenue. There was a board up stating that there was no thoroughfare, and at the bottom there was a black wall of wooden blocks, through which nothing could pass. He could not see how he had been guilty of obstruction when there was practically no thoroughfare to obstruct, for no traffic was allowed on the road. The Chairman said that defendant had committed a technical breach of the bye-laws, and he would be fined 1s. and costs.

NO LIGHT.

At Guildford, Maximilian Prashkauer, of Womersley, was summoned under the Light Locomotives Act for not having a light attached to his motor-car on the 18th of July, after sunset. P.S. Matthews said that on the night in question he was at Womersley when he heard a motor-car, and as he was cycling he rang his bell several times. On coming up he found the car, which had apparently stopped, just starting again. There were no lights, and it was about thirteen minutes after the proper time to light up. Defendant said his lights had gone out, owing to the vibration, and he was just going to the top of the hill before re-lighting them. Fined £2 10s.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, AUGUST 24, 1901.

[No. 129.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THOUGH the King is at Homburg for his health he is as enthusiastic an automobilist as ever. On Friday of last week His Majesty visited Friedrichshof Castle on a motor-car, returning the same evening in company with the Queen and Princess Victoria. On Saturday his Majesty was visited by the Grand Duke of Hesse, and the King and the Grand Duke drove together in an automobile to Frankfurt. On Monday his Majesty visited Saalberg in his car, and on Tuesday journeyed as far as Koenigstein. The persistent devotion of his Majesty to his favourite means of travelling is having a marked effect upon automobilism. Day by day we hear of fresh converts from the ranks of the *elite* of the land, and soon non-motoring society will be but a small minority.

"Reigate Welcomes Progress."

WERE the words displayed in large letters on banners strung across the main street on the occasion of the inauguration run to Brighton in November, 1896. On succeeding anniversaries similar effusiveness was displayed, and how the practices of the Reigate authorities differed from their precepts was proved last Saturday. Between Redhill and Reigate is a distance of about 1½ mile, and at the summit of a rather sharp incline was to be seen an interesting "farmer-looking sort of a chap," who as soon as a motorist passed blew a shrill whistle, the signal for a posse of policemen to spring from hiding places and stretch themselves across the road. The unfortunate motorist was perforce bound to stop, and, in response to the innocent enquiry as to what was "wrong," was informed that he had been timed over a distance of 176 yards. In one particular instance our friend had travelled the distance in 18 seconds—equal to 20 miles an hour. All this information was not obtained at once, as the enquiries were disturbed by the sound of the whistle again. In this instance a gentleman not unconnected with Long Acre and mounted on a Darracq was the victim. The whistle quickly blew again and a quad was seen sailing along at full legal speed. The vehicle suddenly stopped, however, after travelling two-thirds of the distance and the other victims had a smile, but the Inspector remarked "it was all right, they'd had him in the morning." Altogether we are assured some fifty automobilists had their names and addresses taken and riders are now awaiting further developments.

Road Improvement.

THE interest of the military authorities in mechanical transport seems likely to confer a good deal of indirect benefit on automobilism, especially in the direction of road improvement. A difficulty which has occasionally cropped up and which will become of much greater significance as heavy motor traction increases lies in the inadequacy of many country bridges for heavy loads, the upkeep of these in some cases falling on local

property owners in spite of the fact that the roads they carry are highways, an anachronism that calls loudly for abolition in the present day. It may be urged that districts off main roads can be sufficiently served by lighter vans, but this, if true in the present state of industrial motor traffic, cannot long remain so, and the suggestions of the War Office to local authorities may be expected to give some stimulus to the maintenance of our highways in a condition suitable for the great demand upon them that is, in the near future, impending.

The Glasgow Reliability Trials.

ARRANGEMENTS are well in hand for the reliability trials which are to commence at Glasgow, on Monday, September 2nd. In Section 1 (manufacturers) the entries, up to the time of writing, number no less than forty-one cars; in Section 2 (privately owned cars), there are eleven entries; while in Section 3 the entries comprise a set of Dunlop tires affixed to a 12 h.p. Panhard car; an Auto Sparker, *i.e.*, a governed dynamo for supplying the current for electrically-ignited internal combustion engines, by the Motor Manufacturing Company, Limited; the Dawson Magneto-electric ignition, entered by Messrs. Henry T. and Harry A. Dawson, Canterbury; and a Simms-Bosch magneto-electric ignition and interrupter-timing gear, entered by the Simms Manufacturing Company. A list of the vehicles entered is given on another page.

Scarborough's Chance.

SCARBOROUGH has a chance of making history and profit simultaneously. The Corporation is being approached by a company seeking powers to lay down plant and run electric trams on the overhead system. Already the streets are often inconveniently crowded in the summer season, and to allow a service of trams to take up a large portion of the roadway will add to the confusion. No wonder is it, then, that a local agitation is arising for the adoption of a motor-car service as an alternative, and we trust the members of the Corporation will thoroughly consider the advantages of the automobile before adopting the disadvantages of the tram-car. The motor-car requires no specially constructed roadway; it needs no ugly adjuncts in the way of overhead wires, and it can go where tram-cars cannot.

Educating the Boroughs.

RECENTLY the Automobile Club has done splendid work in educating County Councillors, who threatened to number our cars and imprison our bodies. It can add to its services to the movement by giving heed to the lack of knowledge possessed by Borough Councillors, and demonstrating in a few crowded cities the advantages of motor-car services over tram-cars. This should be comparatively easy, and if representative English towns were selected for the demonstrations great good would result. Dwellers in towns and those who govern their local institutions have only to be persuaded of the undoubted convenience of the motor-car as a public vehicle in towns and cities to become ardent advocates of its adoption.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Carage open day and night, all cars in stock, 100-104, Long Acre, W.C.

The Disuse of Stables.

NOT only will the general adoption of the automobile assist those interested in keeping our streets clean and sanitary, but in obviating the need for stables in crowded localities it will play an important part in helping the sanitary reformer. Stables are a nuisance in crowded cities; and the fact that they often adjoin dwelling-houses is one deplored by those who want to see healthy conditions encouraged.

"Automobile Staggers."

KNOWING as we do how common the motor-car is in the cities of the States, it is with some astonishment that we note the very long list of fashionable Americans whose horses seem to have suddenly developed "automobile staggers," to the risk of the occupants of the carriages they draw in various holiday resorts. American journalism, with its insatiable craving for personal paragraphs, no doubt makes the most of such incidents, and the fair victim of a runaway loses nothing by having her name dragged before the public. Still, we cannot help wondering why up-to-date Americans have not found some means of accustoming horses to motor-cars. King Edward set a good example, which has been widely followed in this country, in having the royal horses fed to the music of a running motor. The royal example has been followed in other quarters, and as a result it is only the unknown provincial nag that would so far forget itself as to condescend to notice a motor-car nowadays.

MR. F. J. BUTTERWORTH ON HIS "STAR" CAR. SNAPPED AT MORTON OLD HALL, NEAR CONGLETON, CHESHIRE.

Furious Driving in Yorkshire and Lincolnshire.

ON Saturday last at the Doncaster West Riding Police Court, on the magistrates taking their seats, the Chairman (Mr. G. B. C. Yarborough) said the magistrates wished to say a few words with respect to the speed at which motor-cars were driven through the district. The statutory speed was 12 miles per hour, but in many cases the speed was nearer 30 miles an hour. During the last fortnight he had noticed three narrow escapes. One was not in that division, but it was on the great North road, and the speed at which the motor-car was travelling was 30 miles an hour. Two children who were crossing the roadway were nearly run over, and two horses were considerably frightened. He asked the superintendent of police to communicate the opinion of the Bench to the Chief Constable of the West Riding, who might then take some steps in the matter. Supt. Blake said it was a very difficult matter to stop motor-cars, and the Chairman remarked that they must stop somewhere in the West Riding. The same question also cropped up at a meet-

ing of the Grantham Rural District Council on Monday. Mr. B. Beeson, in moving a resolution: "That this Council requisition the Kesteven County Council to frame bye-laws for the regulation of the speed and traffic of motor-cars, and applicable to the whole of the district under their control," said there were motor-cars passing on the North road that exceeded thirty miles an hour. He could not think why a motorist's pleasure should be at the expense of the ratepayers in the district. There were men going along that road who looked more like fiends than individuals. The resolution was carried, and it was decided to send a copy of the resolution to the Urban and Rural District Councils in Kesteven, and ask them to pass similar resolutions.

Motorists and their Rights.

AT Market Rasen Petty Sessions, last week, a case of great interest to motorists was heard, Richard Bennett, farmer, Glentham, being summoned for not allowing a motor-car to pass him whilst he was driving a cart on the Gainsborough Road, at Kingerby, on July 13th. It appears that Mr. Nainby, of Thorganby, accompanied by a lady and two gentlemen, was riding on his motor-car to Wiseton on July 13th, and on the Gainsborough Road, at Kingerby, he overtook the defendant, who was driving with his wife in a cart in the same direction. Mr. Nainby sounded his horn several times, but the defendant who refused to make room for them to pass on the right, turned and laughed at the motorists. Defendant asserted that the road was too narrow for them to pass, and that there was a deep ditch on the left. He signalled to them to pass on the left, but they declined. Had he so wished, defendant could have turned up another road to make way for those behind, instead of which he kept on past Bishopbridge, where the road became much wider. He still refused to let Mr. Nainby and his party pass. Just then a policeman hove in sight, but when defendant caught sight of him he quickly drew to one side. The chairman said the Bench had given every consideration to the case, and their opinion was an obstruction had been caused, but as this was the first case of that class to come before them they would be lenient, letting off the defendant with a fine of 5s. and 6s. 6d. costs.

The New Canine Danger.

IN encounters between dogs and motor-cars the dog usually suffers most. But now and then we hear of a case where a vehicle striking a dog while it is running at a high speed is deflected so much from its course as to be landed in the ditch at the roadside, to strike a tree, or to suffer damage in some other manner. A case in which the results are more serious than ordinarily is reported from the United States. Two gentlemen were out driving in an automobile when a big St. Bernard dog rushed at the vehicle, overturning the machine and seriously injuring the occupants. The details are not very plain from the account to hand, but it is to be inferred that the road where the vehicle was overturned was favourable to such an accident, that the vehicle was of the lighter class, and that it was being driven at a good pace. Such a combination of circumstances would lead to the results indicated. The one precaution which will prevent accidents of this kind is to keep the speed well within limits.

Roadside Zoology.

THE study of animal characteristics assumes a new perspective when undertaken from the seat of a motor-car, to the destruction, moreover, of some cherished illusions, that of canine intelligence being among the chief, while in spite of the trouble provided for us by the horse, the candid observer cannot attribute it to any lack of this quality. When not in harness, a stray horse by the roadside frequently shows an intelligent interest in matters automobile, which, moreover, never leads him to obstruct the way; and it is not uncommon to find a horse that will face a motor, but cannot stand one behind him. The cow, on the other hand, has been an obstruc-

tive to mechanical progress from the days of Stephenson downwards, with the prospect in these days of the contest being more even than he anticipated, and is only less effective in causing delays than a flock of sheep. But, of all animals, the dog is most to be feared by the nervous driver, and his wild attempts at Juggernaut-worship are only assisted by dodging tactics on the part of the motorist. It cannot be too often impressed on the beginner that the safest course, where stopping is impossible and a collision seems likely, is to keep on in a straight line; in most cases the animal gets out of the way, and in any case the chance of a spill through striking an obstruction is far less if the car is going on a straight course, while irreversible or well geared-down steering will further diminish the risks which without these may even attend the presence of the ubiquitous half-brick.

Antipodean Automobilism.

THE automobile has not made that headway in New Zealand which might have been expected in a country second to none where scenery is concerned, and perhaps first in the whole world as far as roads go. Possibly the absence of local makers and the expense of transport to the remote islands may account for this. Canterbury, in the South Island, which is in all things a keen rival to Wellington, the capital, possesses only seven automobiles, four of which are cycles. Of the three *bona fide* motor-cars, one is a Benz and the other two are French vehicles, run under appropriate Colonial baptismal names.

Funeral by Motor-Car.

THE first appearance of motor-vehicles for the purpose of a funeral was witnessed at Coventry on Thursday last week. The funeral was that of William Drakeford, who had been in the employ of the Daimler Motor Company, Limited, at the Motor Mills as caretaker, and previous to that firm occupying the premises he had been engaged by the old Cotton Company for a long period, his terms of service in connection with the mills extending over forty years. The motor-vehicles used for the funeral comprised three cars, that upon which the coffin was carried being a specially arranged 6 h.p. Daimler carriage. It was painted black, and the body of the car was draped with black cloth on each side, which gave it a very sombre appearance. The unusual cortège attracted a good deal of attention as it passed through the city. The motor-hearse which carried the pall-covered coffin came first, two ordinary horse-drawn mourning coaches, containing the mourners, relatives, next, and these were followed by two Daimler-Parisian cars containing representatives from the Daimler Motor Company. One of these was a car belonging to Mr. Lewin, of Cambridge, who is now in Canada, and was driven by Mr. T. Soden. The other car was driven by Mr. Oliver Stanton, who originated the idea of motor-cars taking part in the funeral of one who had so long a connection with the building in which so many cars are now produced.

An Amateur's Car.

A LARGE motor-car, built as an amateur experiment by Mr. E. Boundy, of the Station Marble Works, Kendal, performed its trial trip with remarkable success last week. The vehicle is provided with a 9 h.p. Napier motor, a three-speed gear, with a maximum of twelve miles an hour, and, if fitted for the conveyance of passengers, would carry ten persons. Mr. Boundy's idea, however, was to construct a car suitable for the transport of masonry. He set about the work in his leisure time about five years ago, when heavy motors were a new thing in England, had various working parts made to his own designs and drawings, got his gears, radiator, axles, rims, tires, motor, and other details of the machine from a dozen various firms, supplied the simpler parts of the structure by his own labour, with the aid of a lathe, a smith's hearth, a small engine, and an anvil, and did the whole of the building and fitting of the car himself. As an amateur feat the result is surprising,

for the car on its trial trip ran to Dalton and back, a distance of sixty miles, without a breakdown, and took the long climb up Lindale Brow, and the wretched up-and-down road beyond Ulverston, without difficulty. Mr. Boundy has promised to send us a photograph of the vehicle at an early date. In the meantime, he adds that should any owner of a car be stranded in the Kendal district he will be glad to direct them to the right man to do any repairs required.

Motor-Cars in Madagascar.

A FRENCHMAN who has settled in Madagascar has attempted to take a census of automobilists, but finds his figures constantly falsified by fresh arrivals. In spite of bad roads motor-cars and cycles are common in the island. The Governor is an enthusiast and General Gallieni delights in taking the wheel of the 6 h.p. car which conveys him to various parts in the discharge of his onerous military duties. The island already supports one *depôt* which does well in accessories, repairs, and an occasional whole machine. Considering the disadvantages presented by the country the movement may be regarded as in a flourishing condition.

THE "POWERFUL" ELECTRICAL CAR AT BETCHWORTH BRIDGE, NEAR REIGATE.

Safety in Numbers.

NEAR Toulouse, quite recently, some peasants discovered a motor-car bottom upwards on the high road, and beneath it a man lying insensible. Picked up and taken to the nearest farmyard, the man, who is still in a critical condition, said he had no recollection of the circumstances of the accident, and was utterly unable to account for it. The medical opinion is that the patient, who had latterly been under treatment for a nervous disorder, must have suddenly had a fit while driving at high speed and let go of the steering-wheel of his car. Accepting the doctor's theory as to the cause of the accident, one's eyes are opened to the risk run by the solitary motorist; particularly if he be of that class which has taken to the automobile as a means of restoring his health. A companion capable of taking the wheel in a moment of emergency is, apart from the question of the pleasure which his company may or may not afford, a most desirable acquisition even on a short spin.

MR. T. RATCLIFFE, of the Reliable Cycle Works, Frinton-on-Sea, Essex, has taken up the manufacture of motor-bicycles, of which he has just issued a neat little price list. Minerva motor and fittings are employed, the arrangement adopted being also similar to that followed in the Minerva motor-bicycle.

THE STIRLING PARISIAN PHAETON.

THE accompanying illustration shows Mr. J. Stirling on the Stirling Parisian phaeton on which he successfully made a run from John o' Groat's to Land's End recently. As much interest is being aroused in the vehicle by reason of its performance, Stirling's Motor Carriages, Limited, have furnished us with the following details.

The vehicle is fitted with a $4\frac{1}{2}$ h.p. (effective) single-cylinder water-cooled motor by Panhard and Levassor, running at a speed of 750 to 800 revolutions per minute; it is furnished with a governor somewhat after the manner of a Daimler motor, and is fitted with both tube and electric ignition. The car is gear driven, three speeds and a reverse motion being available. The wheels of the variable gear are always in mesh, and the speed changes are effected silently and without shock by means of a sliding key. The speeds are nominally 6, 12, and 18 miles an hour, and the reverse about 4 miles. A leather-faced friction clutch intervenes

between the motor and the speed gear, and is controlled by a pedal, the same way as on the well-known Panhard cars. A powerful double-action brake is fitted, operated by another pedal. An auxiliary side-lever tire brake is also provided. The cylinder cooling water is circulated by a rotary pump driven by a friction pulley off the engine fly-wheel. Steering is controlled by means of a hand-wheel, while the road wheels are of wood with artillery hubs, and fitted with $2\frac{1}{2}$ in. Dunlop or Michelin pneumatic tires. The diameter of the hind wheels is 34 in., and that of the front wheels 26 in.

LORD ALWYNE COMPTON and Mr. George Kemp, M.P., are amongst the latest converts to motor-bicycling.

MESSRS. GREEN AND Co., engineers, of Reginald Road, Bexhill-on-Sea, undertake repairs and alterations to any make of motor-car.

TWO Bideford gentlemen, Mr. Prideaux Brune, of Glenlower, and Major J. H. Lamont, of Golfstone, Westward Ho! received delivery of new motor-cars last week.

THE Midland police have been paying a great deal of attention to motorists lately. On Saturday last, the general manager and works manager of a large motor firm had their names taken, as also did the works manager of another concern.

AUTOMOBILISTS who may be passing through Hastings can have any necessary repairs attended to by the Hastings and East Sussex Motor-Car Syndicate, whose offices are in Cambridge Gardens. Petrol can be obtained from Mr. T. A. Noakes, of 3, Cambridge Gardens, also from the Cinque Ports Cycle and Engineering Company, of 14, George Street, and at the establishment of Mr. Geo. Mence Smith, in George Street.

THE IRISH AUTOMOBILE TOUR.

LAST week we left the motoring party making the trip from Killarney to Limerick on Wednesday, the 14th inst. Splendid weather favoured the run, and the country looked magnificent as the motorists sped over the moorlands. Once out of Kerry bad roads were encountered, but the superb scenery along the Shannon estuary somewhat compensated. Viler grew the roads, till within a few miles of Limerick they became perfectly abominable. At Limerick the party was joined by the Hon. Leopold Canning, and several other motorists. So far the behaviour of the cars has been very satisfactory. The record is perhaps held by Dr. Colohan, whose Daimler car, since the commencement of the tour, has not needed the slightest adjustment. The attentions required by other vehicles have been mostly of a minor description. One of the cars had a very narrow shave that day in passing a horse-drawn vehicle. It was a case of squeezing through a very narrow opening or injuring the horse, and the motorist chose the former, and had a mud-guard torn off his car in the effort.

EIGHTH DAY.

Thursday was a day of surprises for the motorists. They had assembled in force in Limerick over-night, and it was expected that the day's journey to Kilkee would be made by all the cars. Unfortunately, these hopes were doomed to disappointment. The start from Limerick and the progress for a considerable distance beyond Ennis was magnificent and impressive. At the various hotels the machines were drawn up early in the morning. The weather was splendid, and an eventful day's outing was anticipated. Dr. Colohan, on his Daimler, was the first to pass down Patrick Street, and across the Shannon to the Clare side, the boundary of the two counties was soon reached.

For some distance into Clare the scenery is uninteresting, except for occasional glimpses of the lordly Shannon. Bunratty Castle, a noble old ruin, was an object of much interest. The villagers of Sixmilebridge turned out to cheer the arrival of the cars, and Newmarket paid the party equally polite attentions. The town of Ennis, which was next reached, for a considerable time was a scene of remarkable animation, the streets being crowded, and constables keeping the roadway clear for the cars. Once Ennis was passed troubles began. The Intelligence Department was defective, and the native guides most treacherous. Nobody seemed to know the right road, and the ignorance of the people as to the whereabouts of towns and villages was indicative of anything but travelling propensities. Accordingly, every single car seemed to take a different road, and mostly went miles before the error was detected. Then a headlong return would be made to the main road, and at every "cross" motorists struck each other returning from different directions. The result was a foregone conclusion. Night found the cars not all at Kilkee as had been arranged, but dotted all over the western part of the County Clare. Some succeeded in keeping the road through Kilrush into Kilkee. Some, having gone so far out of the way as Miltown Malbay, made south for the objective point. Some rushed on to Lahinch, and some shot out from Ennistymon into the famous health resort, Lisdoonvarna. It will thus be seen that all pre-arranged plans fell to the ground. Still, the run was exceedingly pleasant. The roads were none too good, and the lack of signposts—a most grievous want in all parts of Ireland, and a serious drawback to touring—made it difficult to move on with confidence.

NINTH DAY.

This day's programme was from Kilkee to Galway, a distance of 90 miles, the route being *via* the Clare coast, which contains more beautiful and imposing marine scenery in its length than perhaps all the remainder of the Irish coast. It needed but a few miles of travelling by such places as Lahinch and Liscannor to aver that even the Kerry coast is far inferior to Clare. Perhaps the fine weather and the excellent roads had something to do with the enthusiasm which prevailed. After climbing a very steep hill out of Liscannor, O'Brien's Tower, the starting point for visiting the cliffs of Moher, was reached. The building, though of modern date, has been battered into an interesting ruin by the west wind, and is a fitting adornment to the

approach to the cliffs. Topping a little knoll, the visitor is suddenly confronted with the view of sheer walls of rock rising from the sea nearly a thousand feet below. The sight has almost a stupefying effect on the beholder, so immense are the perpendicular distances separating land from sea.

The run was one of rare excitement to the occupants of those cars which elected to go by Lisdoonvarna instead of Black Head. They had an opportunity of testing their steering powers over the famous Corkscrew road. This is undoubtedly the most winding road in Ireland, and nearly resembles the roads which zig-zag up the Swiss passes. It is very narrow and the corners are fearfully abrupt. It was with some misgiving that the descent was commenced, as it seemed as if the cars would wedge at some of the turns. With brakes hard on, however, the descent was made, the only incident being a damaged brake on one of the cars. So severe was the friction that the brake actually took fire, and water had to be procured to quench it. The remainder of the journey lay through a land of stones, and no drearier scene could be imagined—a terrible object-lesson on the poverty of West Galway. Galway was reached in good time, after one of the most enjoyable runs of the whole tour.

Only six of the cars turned up, however, Dr. Colohan's Daimler, Mr. R. J. Mecredy's Daimler, Mr. Goff's Napier, the Hon. Mr. Canning's two Century tandems, and Mr. Buckea's 7 h.p. M.M.C. Mr. Goff returned to Waterford, and two of the others left for Dublin. It may, therefore, be taken that the Irish tour practically ended on Friday last week. Before departing, the English motorists, who did not go northward, sent the following telegram to Mr. Goff, the President of the Irish Club, and Mr. Mecredy—"The English contingent wish to express their keenest appreciation of the splendid reception accorded them by the Club and Irish people throughout the tour, and would like to convey through the Press their heartiest thanks to the Club."

TENTH DAY.

Saturday broke threateningly, but about noon there were sufficient signs of a mend in the weather to encourage the drivers of the two remaining cars, Dr. Colohan and Mr. Mecredy, to attempt the journey from Galway to Recess (forty-eight miles). Recess had been appointed as the halting-place, but there was no accommodation to be had there, the hotel being full up, and accordingly Dr. Colohan made by the direct road for Clifden, while Mr. Mecredy went by Spiddal to Leenane, having some thrilling experiences in the dark in the latter part of the run. Galway had scarcely been left when the heavens opened, and a perfect deluge fell during the rest of the day.

ELEVENTH DAY.

Sunday proved a gloriously fine day, and Mr. Mecredy took his party out for a spin of over ninety miles by Glen Inagh, Ballynahinch, Cashel, and Roundstone, and back to Leenane.

TWELFTH DAY.

The motorists still on tour started on Monday morning in fair weather for a circular run through Connemara. Dr. Colohan, on his Daimler, put off from Clifden, and ascended the mountains until he reached the descent into Letterfrack. Mr. Mecredy and Mr. Buckea were met at Kylemore Castle, and the journey was continued into Leenane. The greatest interest was manifested by the villagers and peasants *en route*. Mr. Mecredy went on towards Sligo in the evening, Dr. Colohan returning to Galway, and the tour may, therefore, be said to have come to a conclusion.

THE BARDON 10-H.P. MOTOR-CAR.

SOME time ago we illustrated and described the 5-h.p. car made by the Société d'Automobiles et de Traction (Systeme Bardon). The Auto-Carriage Supply Company, Limited, of Great Portland Street, W., are just putting on the market a 10-h.p. car by the same makers, and of which we are able to give an illustration herewith. To deal first with the engine, this is located under a bonnet in the fore part of the frame. It is of the horizontal petroleum-spirit type, and while having only two cylinders there are four pistons. There is a common explosion chamber between each pair of pistons, the engine comprising but two inlet valves, two exhaust valves, and two sparking plugs for the four pistons, there being, however, four fly-wheels. The normal speed is 1,000 revolutions per minute; by means of a foot-controlled "accelerator" this can be increased up to 1,200 revolutions. The cylinders are water-jacketed, the circulation being maintained by a pump.

Coming now to the transmission mechanism, the car is fitted with four speeds forward and a reverse motion, controlled by one lever. The system of transmission is on novel lines. As already mentioned, the engine is located transversely in the fore part of the frame. The rear end of each of the two crankshafts

terminates in a bevel wheel, meshing with corresponding bevel pinions on the ends of a cross variable-gear shaft running at the same speed as the crankshafts. Mounted loosely on the cross shaft is a sleeve which can at will be connected with or disconnected from the shaft by a special double friction clutch. On the sleeve are mounted a train of spur wheels, any one of which can be brought into engagement with corresponding pinions on the differential shaft. From the differential shaft

THE BARDON 10 H.P. CAR.

the power is conveyed to the rear wheels by the usual duplicate set of chains and chain wheels. Special attention has been devoted to the lubrication of the working parts, lubricators in the dash, in full view of the driver, conveying oil to the crank chambers and main bearings. Steering is controlled by an inclined hand-wheel, around which the various control levers are grouped. A foot-pedal operates a band brake on the differential shaft, while there are band brakes, operated by a hand lever, acting on drums attached to the hubs of each of the rear road wheels. Artillery-type wooden wheels are fitted, and these are shod with pneumatic tires. The frame being entirely independent, any type of carriage body, the illustration showing a *tonneau*.

THE city council of Newport, R.I., has granted permission for an automobile race to be held on the Ocean Avenue of that fashionable resort on the afternoon of August 30th. The race will be held under the auspices of the National Automobile Racing Association, of Newport, of which Mr. W. K. Vanderbilt is president. The thoroughfares which will be used afford a circuit of ten miles. According to the conditions imposed by the City Council, each of the intersecting streets must be flagged, and each racer before he starts must give a bond that he will compensate for any damage that he may do. It is understood that all owners of fast automobiles in America will be invited to take part in the race.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Carage open day and night, all cars in stock, 100-104, Long Acre, W.C.

THE "MABLEY" CAR.

As mentioned in a recent issue, we had an opportunity the other week of inspecting a somewhat novel type of light car about to be put on the market by Messrs. John Marston, of Wolverhampton. Though a four-wheeler, it embodies the principle of double steering, the arrangement of the four 26 in. wheels being somewhat like that of the old Coventry rotary sociable, the fore and aft wheels—nearly, but not quite, in the same track—steering, while the two on the main axle are the drivers, it being claimed that by this arrangement side-slip is impossible. We are now able to give illustrations of the car, which

FIG. 1.—FRONT END OF "MABLEY" CAR.

has been designed with the object of providing a simple and comfortable motor-vehicle in a compact and light form. No attempt has been made to follow the general lines of a "horseless carriage." The general appearance of the car is that of two lounges placed *vis-a-vis*, beneath the seats of which is fixed a central trough or keel containing the mechanism, rendering the latter easily accessible from above, and entirely protecting it from dust and mud. The vehicle is arranged to be driven by the rear rider, who

FIG. 2.—REAR END OF "MABLEY" CAR.

has under his hand the ignition, gas, air, and compression levers, together with the lever controlling two speeds and a starting handle. The length of the car is 7 ft., and width over all 38 in. The engine is a $2\frac{1}{2}$ h.p. De Dion, with a water-cooled head. This drives, through a belt, a pair of pulleys in the rear of the main axle, with a loose pulley between, somewhat as in the 3 h.p. New Orleans. From the countershaft the power is conveyed to the main axle by means of chains. The engine is placed over the front wheels, and an ingenious spring suspension enables all four wheels to remain on the ground in spite of irregularities. As may be gathered, the little car has about the proportions of a quad., but the seats are roomy and comfortable.

Owing to the extreme lightness of the car, the makers claim that it is possible to use the simplest mechanism, and a comparatively small engine, with the consequent absence of strain on all parts. They also add that the slight weight on the tires reduces the liability to puncture; while the ease with which the car can be manipulated makes its management possible even to a child. The necessity of keeping the car clean has not been ignored; the cushions are made removable as in the case of a boat, the polished wood sides and undercarriage completely enclose all working parts, and thus the whole can be washed as an ordinary dog cart. The vehicle weighs complete about 4 cwt., and can attain any speed from 4 to 20 miles an hour. One of these cars was driven from Wolverhampton to Brighton and back a few weeks ago, the run being most successful.

CORRESPONDENCE.

RED HOT EXHAUST PIPES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a $2\frac{1}{2}$ h.p. De Dion motor which has lately been cleaned. Since that, however, the exhaust pipe gets red hot after about three minutes' run. Could any of your readers kindly inform me why this now happens, and whether it is good or bad as regards power evolved?—Yours faithfully,

T. C. FRANCIS.

A SUGGESTED CLUB FOR MOTOR BICYCLISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to the suggested club for motor bicyclists, I think Mr. Underwood has struck a note that will appeal favourably to a good many riders of this class of machine. Tri-cycles are fast going out, while bicycles are evidently coming in, and as there seems to be a certain "caste" difference between motor-car drivers and users of the two-wheeler, I shall be very glad to support any movement in favour of a M.B.C.—Yours faithfully,

JOHN J. LEONARD.

THE LOCOMOBILE STEAM CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In February last, on application, I received from the Locomobile Agency in Southport some literature. One of the pamphlets sent to me was entitled "How to Operate." After studying this, and also the prospectuses of other firms, I decided in favour of a Locomobile steam car, and in May I went over to Southport and bought one from Mr. Buxton, the agent there. Although I like the car very much I did not care for the petrol fuel, on account of its inflammable nature, and also on account of its cost. There were some points about the car that I did not understand, so I wrote to the agent for information. Much of this Mr. Buxton kindly supplied me with, but I was not quite satisfied. In "How to Operate" it says "there are three check valves 'B,' 'C,' and 'D,' between the water tank and the boiler." I could only make out two of these valves and asked about the third. In reply Mr. Buxton says, "I am afraid the book is not as up to date as the car, the third valve is in the pump." This explanation is possibly sufficient for an engineer, but I am not an engineer, only a customer. Again I quote "How to Operate." "All needle valves have been furnished with neat metal wheel handles." I asked why several of the needle valves in my car were not furnished with metal wheel handles. To this query I have had no answer.

After using the car for a short time it met with an accident, and as I was afraid of the petrol I sent it up to Clarkson and Capel's for repair and also to have the Clarkson burner and condenser added. On hearing that the car was finished, I went up to London, had the alterations carefully explained at the works, and then drove the car from London to Chester. I did not try to cover the distance as rapidly as possible, as I wished not only to give the car a fair trial, but to enjoy the drive, and to see the country. I went about twenty miles the first day, sixty miles the second, sixty miles the third, and the remaining forty-two miles the fourth day. I did not notice particularly the amount of water consumed, as the water tank was filled up before starting each day and at lunch time also. The paraffin

consumed was eighteen gallons, costing 7d. or 8d. a gallon. This works out about one gallon for ten miles, but as I was not anxious to see how small a quantity of paraffin I could use, I did not spare it, frequently stopping for several minutes, leaving the paraffin still burning. It appears to me that a gallon would easily go twelve or thirteen miles if that were the principal object. I may add that after further experience I am perfectly satisfied with the burner and the other additions made to the car by Clarkson and Capel.—Yours truly,

JAMES TAYLOR.

A NEW UNIVERSAL-JOINT PROTECTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of August 10th, which, owing to my being away from home, I have only just seen, I notice a paragraph and drawings of the Thomas universal-joint protector. I am sending you an example of my own patent dust-proof cap, which I have had in use on the De Dion voiturette all the summer and have found most effective. You will see the similarity of the two ideas, which I think is an extraordinary coincidence, seeing that I did not know until I saw your journal that such a device was in existence.

There are one or two slight differences in the construction of the caps, one of the chief being the small spring which I place on the leather cap in order to keep the joints of the washer absolutely tight. One of the ends of this spring can be unhooked and the washer placed round the axle and the spring refixed, thus rendering the whole joint water-proof and dust-proof while allowing the movable joint entire freedom.—Yours faithfully,

H. MULLINER.

[We have examined Mr. Mulliner's protector, which is, as he says, very similar to the Thomas device illustrated in a recent issue. It is strange that two inventors—one in France and one in England—should hit on practically the same idea. Ed.—*Motor-Car Journal*.]

RANDOM JUSTICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see in last week's *Journal* a list of places where random justice has been administered to motorists. Why miss Chelmsford, one of the principal towns visited by innocent and persecuted motorists bent upon enjoying the delightful local scenery and all that nature gives to the intelligent user? Yet, in spite of its natural advantages, Chelmsford is likely to remain in the rearmost rank of advance because of the poverty and ignorance of its ruling brains, which are incapable of absorbing new ideas. Hardly a week passes without a fine of £5 and costs being inflicted at the Shire Hall upon some unfortunate motorist in spiteful hate of progressive ways. As a driver on the roads of this locality I find that if the automobilist was of a litigious nature scarcely a journey would be made without some of the following charges against horsekeepers being brought into the Shire Hall:—Leaving horses unattended, driving on wrong side round corners, driving without lights, asleep whilst driving, causing obstruction by crossing and recrossing ahead of a car, and driving uncontrollable horses to danger of life and limb.

The light of reason may break upon a country which within the memory of many now living opposed the railway as detrimental to the carrier's cart, which deposited the commercial for a night at the village tavern; but it will be foreigners who bring the needed brain. It often strikes me that we should have fewer robberies and less crime if the police were more devoted to their detection than to motor-cars, public-houses, and small boy offenders. How many accidents can be proved against the fourteen-mile-an-hour car as against those arising from the above-mentioned causes, each of which is a breach of the law.—Yours truly,

FAIRPLAY.

MR. G. H. BECHTEL, of Southport, writes: In your last issue there is a short paragraph stating that Mr. E. Collins, of Coventry, was the agent for the Werner motor-bicycle for the north of England. May I be allowed to state that I have an agreement with the Motor Manufacturing Company whereby I

can sell any of their cars, tricycles, or Werner bicycles in Manchester, Liverpool, Southport, and surrounding districts?

THE SENNEVOY TIRE-REPAIRING DEVICE.

THE Baron de Sennevoy, of Paris, has lately devised a sleeve or band of soft rubber for use in repairing the inner tubes of motor pneumatic tires. It consists essentially of a ribbon of thin elastic rubber *a*, one of the ends of which is slightly reduced in width and the other end of which forms a buckle or clasp *c*. This buckle is made either of the same piece as the band or ribbon, or it is cemented to it. Above this buckle or clasp there is a second one *d*, cemented to the ribbon *a*. This second clasp, the same as the first one, may be formed by an integral portion of the ribbon.

The use of this sleeve is as follows:—After having located the puncture, a piece of ordinary patching rubber is applied in the regular manner. Then the sleeve is taken and is immediately placed around the inner tube over the puncture or patch just applied by passing the reduced end through the clasp *c*, nearest the ribbon, bending it back and passing it through the second clasp *d*. The sleeve formed in this manner is made of such diameter as to be slightly smaller than the inner tube when inflated. To insure an absolutely reliable joint between the ends of the sleeve the latter is turned inside out, so that the clasps come in contact with the inner tube and the air pressure within this tube assists in strengthening the joint.

The inventor of the device claims that by its use all risk of the patch being detached in places, and becoming leaky by the air pressure within, is obviated, and that, on the contrary, the air pressure does its share in maintaining the patch perfectly tight. The advantage claimed for this method of repair is that it permits the motorist to proceed as soon as the repairing is done without waiting for the solution to dry.

CONTINENTAL NOTES.

By "AUTOMAN."

THREE rival flying machines are being prepared with feverish haste near Paris, and each of the inventors or constructors is equally certain of being able to win the Deutsch prize quite easily. M. Santos-Dumont will have the balloon for his No. 6 delivered to him by its maker, M. Lachambre, on the last day of August. The balloon will not be cigar shaped this time, but will be ellipsoidal, to use the correct scientific term, or like a sausage, to revert to every-day language. It will be of slightly larger capacity than the last, in order that water-cooling may be added to the Buchet engine, which is already in the workshops of M. Buchet with that object. The water-cooling will be a great step in advance, for the failure of the engine on one or two occasions was entirely due to overheating. The ellipsoidal form has been chosen by M. Santos-Dumont in order to give the ends greater strength to withstand the increase of pressure caused by travelling against the wind. The remainder of the apparatus of No. 5 has been repaired and is ready to be attached to No. 6, which will no doubt be complete early in September.

A LITTLE further from Paris, on the Western Railway between Bois Colombes and Argenteuil, a certain M. Roze is just bringing to completion a much larger flying machine. M. Roze has been at work some years on his apparatus, the model of which has, I believe, travelled in the air. Although quite sanguine, even certain, of the capabilities of his invention, M. Roze has never yet tried it. I well remember in the autumn of 1899 the Duc de Morny bringing me a prospectus of M. Roze's flying machine which was to start from the Paris Exhibition on daily aerial trips to London, Berlin, St. Petersburg, etc., etc. The trips, however, were unavoidably postponed. I understand now, however, that M. Roze is ready to fly, or very nearly so. From the latest reports his hydrogen only required to be purified. His flying machine consists of twin cigar-shaped balloons, made on a light framework of aluminium. From these balloons is suspended the car containing a 20 h.p. water-cooled petrol engine, working four screw propellers; two of the latter are intended to raise the machine, which is $1\frac{1}{2}$ cwt. heavier than the air, and two to propel it in a forward direction. M. Roze has no experience of the air, but if, like M. Santos-Dumont, he has not made a series of flights in more or less experimental machines, he has attended to details which M. Santos-Dumont seems to disregard entirely, for, in a sort of ground floor story underneath the position arranged for the mechanism, there is a car for the passengers, which is most complete in its details—everything that may be required to make the trip pleasant being included.

THE brothers Renard, who are busy constructing a navigable balloon at the military balloon station at St. Cloud, are not only sure of being able to win the Deutsch prize, but they affirm that they will be able to fly to Rouen and back *in any wind*. Details of their machine are, however, difficult to procure.

THE motor-car has become quite a royal institution in Italy since the King, Victor Emmanuel III., became an enthusiastic *chauffeur* and converted his Queen to the pleasures of automobilism. The Duchess d'Aosta and her brother, the Duc de Montpensier, and the Princess Loretta are to be seen frequently motoring, and nothing seems to please the King better than to take his Ministers for a run when they come down to the royal castle of Racconigi, where he is passing the summer. The detectives, whose duty it is to shadow the King wherever he goes, have been mounted on bicycles, but they have a hard task to keep up with His Majesty when he takes the wheel.

THE French federation of *chauffeurs*, conductors, mechanics, electricians, and automobilists has placed before the Chamber of Deputies a petition which aims at the right to organise. The union, which it is hoped to place upon a legal footing, proposes

to issue certificates of efficiency to motor-car drivers and others in charge of machinery. It also stipulates for a recognised rate of pay, regular hours, liability of employers in case of accidents, healthy workshops, and many other points which various Acts of Parliament and trade unionism have made law in England.

ON September 3rd there will be an automobile race meeting at the Motodrome at Ostend, when prizes to the extent of £400 will be competed for. The meeting was intended originally to have been held on September 2, but it was postponed until the 3rd, in order to allow the automobilists who are competing at Deauville on the 1st to be present. There will be three races, viz.:—1, Six laps (about 10 miles), for motor-cycles; 2, Ten laps (about $16\frac{1}{2}$ miles), for light carriages weighing up to 12cwt. 3qrs. 6lbs.; and 3, Fifteen laps (about 25 miles), for heavy cars. Entries must be sent to the Secretary of the Hippodrome Wellington, Ostend.

THE Salon de l'Automobile du Cycle et des Sports, organised by the Chambre Syndicale de l'Automobile, and supported by the A.C.B., has been definitely fixed for March 10 to 19, 1902, and will be held in the great hall of the Palace du Cinquantenaire at Brussels. The centre of the hall will be reserved for trial runs of the different cars.

MR. SHERIFF LAWRENCE, M.P., in company with Mr. Roger Wallace, K.C., the Chairman of the Club Committee of the A.C.G.B.I., left for New York on Wednesday on a visit to Mr. Thomas A. Edison, at Orange, New Jersey.

MR. EDMUNDSON, of the Millown Laundry, Dublin, has purchased a 24 h.p. Daimler motor-van for collecting and delivering goods. The vehicle can carry several tons, and as the class of goods to be carried are bulky for their weight, the car is of large proportions.

MR. BALFOUR, who was for a few days this week the guest of Lord Elcho, drove Lady Elcho to a Church bazaar at Wickhamford in his motor-car. After her ladyship had performed the opening ceremony, Mr. Balfour's car took many of the visitors for drives at a shilling a head, the money earned being devoted to the church restoration fund, on behalf of which the bazaar was held.

THE International Motor Car Company, of High Street, Marylebone, W., have lately introduced several improvements in their Charette cars, and we hope to publish illustrations of the improved vehicle in an early issue. In the meantime we may mention that the company are now offering to send a Charette to any part of England or Wales free of charge, so that intending purchasers may have an opportunity of testing the car over the roads in their own district.

WE learn that the directors of the Century Engineering and Motor Company, Ltd., Willesden Junction, have decided to manufacture and place upon the market at an early date a high-class little motor of about $1\frac{1}{2}$ h.p., suitable for motor-bicycles. Arrangements are already in hand to take this branch up in a thorough manner. Great attention will be paid to detail and finish, and all unnecessary complications will be eliminated, so that even the veriest novice should be able to obtain satisfactory results.

A CURIOUS motor-car accident occurred at Southsea last Sunday evening. Coming to a road which appeared to be partially blocked, as indicated by a solitary lantern swinging in the middle, the driver turned his car to that side which he supposed to be open. A rope stretched across the full width of the road caught his companion under the chin, inflicting such injuries that medical attendance was necessary. Investigation proved that the red light which had attracted the notice of the occupants of the car was some yards on the other side of the rope; also that it was one of four placed one behind the other. The incident suggests yet another danger to motorists at the hands of those ubiquitous individuals whose occupation is the destruction of roads. Motorists riding at night will do well to approach the red light which marks the scene of such operations with the greatest caution.

Land's End to John o' Groat's

ON A WERNER MOTOR-BICYCLE.

AT LAND'S END.

HAVING heard a good deal about motor-bicycles, but not having had any personal experience of them, I borrowed one from the Motor Manufacturing Company, and, after a couple of short rides, was so pleased with its satisfactory running that I decided to give it a really serious test, and I proposed to the company that they should lend me a Werner and let me go from Land's End to John o' Groat's upon it. A machine was prepared with special tanks for containing oil for a long distance, and on Wednesday, July 31st, I took the machine down by train to Penzance, and next morning essayed to start, but had to turn back immediately, owing to the bad state of the weather.

Next morning I left Land's End Hotel at five o'clock, and ran through Penzance and Exeter to Bristol without experiencing any particular adventures till within twelve miles of Bristol. Here the breaking of a small copper washer caused a very serious delay and a great amount of labour. Spare washers should have been in the wallet, but alas! after a long hunt, I could not find them, and so had to make the best of my way with the engine only working at less than half its proper power, over some very steep hills. All the shops were shut when I got to Bristol. Notwithstanding this, I went round in a cab, and did my very best to secure some asbestos, to replace the broken washer. All my efforts were fruitless, and I finally returned to the hotel, offered a reward to anyone who should bring me the much-desired material, and went to bed. It was not till twelve hours afterwards that my reward was claimed by an energetic waiter, who had succeeded in obtaining a small piece of asbestos. The delay, of course, was very serious, but with the asbestos I soon stopped the leak caused by the broken washer, continued my journey, and on Saturday night reached Preston. In this town I stayed for a few hours' sleep, and, rising early in the morning, travelled, via Kendal and Shap Fell, to Carlisle, at which latter place the petrol tanks were filled before leaving for Edinburgh.

At Moffat the mountain road was taken, and I found myself in for a steady climb of many miles over a most dreary pass, where the road was often not nearly as safe to ride upon as the grass bordering its edges. However, Edinburgh was safely reached as evening had begun to draw in. While dining at the Douglas Hotel a gentleman, who had overheard some of my conversation, presently came up and introduced himself as the first rider who ever made the journey I was then engaged upon. He showed me a much-faded photograph, which he took from his pocket-book, depicting himself and his tall bicycle standing outside the hotel at John o' Groat's. This was some time in the seventies, and I was struck by the extraordinary coincidence which should have brought us together in such a curious fashion.

After a short time spent at the Douglas Hotel, I caught the last ferry-boat at Granton, crossed to Burnt Island, and then completed the day's journey by running through pouring rain and in the darkness to Perth. In descending the long hill into Perth the first mishap was met with. Owing to the terrible glare from the powerful electric lights at the foot of the hill, it was impossible to see the road, and, though going quite slowly, I collided with the pavement, coming down with sufficient force to carry away the brake-lever and the advance-sparking lever. From that point I had to operate the brake by holding on to the wire itself, the end of which I had made fast to the handle-bar. I also had to advance and retard my ignition for the rest of the journey by seizing hold of the vulcanite block and moving it to and fro by hand.

Much refreshed by a few hours' sleep at Perth, I left next morning early, and, travelling swiftly through Dunkeld and Pitlochry, had soon left the Pass of Killiecrankie behind and had begun the long ascent from Blair Athol to Dalwhinnie, between which places I had a most amusing and exciting race with a train. The line all along this district runs within a few yards

of the road, and is always well within sight of it. The gradient, of course, is very heavy as railway inclines go, but exactly suited my machine, the more so since the rain, which was falling at the time, practically made a water-cooled of my normally air-cooled motor. For at least seven miles I headed the train, but when the descent began on the other side I was soon, of course, left behind.

At Carr Bridge a few minutes' stop was made in order to have my clothes dried, as there were signs of the weather moderating. I had not reached Inverness, though, when a fresh storm soon drenched me to the skin. I was induced to cross the Kessock Ferry at Inverness, and have repented it ever since. The boat was full of sheep and old women, and the passage took an unconscionable time. The Meikle Ferry, a few miles beyond Tain, is really worth taking advantage of, if the boat is on your side, and the tide and the wind in your favour. In my case the boat was on the wrong side, the tide was dead against us, and

daylight, and the road a perfectly straight one, the cyclist crashed into me, almost as if he had done it on purpose. The impact was terrific, and my cyclist friend performed an aerial flight of a most unusual character. I soon picked myself up, and began to look round to ascertain the extent of the damage. Seven spokes were gone from my front wheel, rendering it impossible even to push the machine. Apart from this, practically no other damage was done, and a friendly blacksmith arriving most opportunely with a cart, I tumbled into it, and was soon safely back in Wick with my machine. During the journey my foot began to get uncomfortably warm, and the cause of it was presently manifest, for my shoe was full of blood, which had poured down from two gaping wounds in my leg. After taking my wheel out and arranging for its speedy repair I had these wounds attended to, and, after a delay of not more than four hours, I found myself once more under weigh for John o' Groat's, where I duly arrived without further incident.

AT JOHN O' GROAT'S.

there was not any wind. Calculating my speed at the legal limit only, I lost about 20 minutes over this ferry. I landed at last, and, having been carefully and minutely directed on to the wrong road, I soon found myself in Dornoch, and in regaining my right course I had to traverse some miles of exceedingly greasy and dangerous roads through some woods. I had fully intended to ride straight through to John o' Groat's without further stoppage, but a puncture near the Mound Station delayed me so long that darkness had set in before I reached Golspie, and, fearing to tackle the much-dreaded Ord of Caithness and the far-famed Berriedale Hill during the dark hours—my lamp had fallen to pieces from the rough treatment to which it had been subjected—I finally decided to await the morning light at Golspie.

Wick was reached at 9.30 the following morning, and I was congratulating myself on the impending successful finish of my journey, when, only two miles from Wick, a cyclist on his wrong side caused me a very bad accident. Though it was broad

My machine was fitted with Dunlop tires, and it is worthy of mention that the front one did not once puncture; in fact, I only had one genuine "wire-nail" puncture (back wheel). The "gash" which I sustained at Golspie was caused by the rear mud-guard having come loose and scraped the rubber off all round the side of the back cover and finally cut through the lining and let the tube through "swish!" In case of puncture, the motor-bicycle can be turned upside down with perfect ease and safety; the accumulators must, however, first be slipped out of their case. The belt gives no trouble, and is, in my opinion, a very satisfactory part of the machine. With the exception of the delay at Bristol, the motor, which was lubricated by D oil, worked excellently.

In closing, I would like to remark that this is the first of the many attempts which have been made to end successfully, one thing or another having always prevented former riders of motor-cycles from getting through at all.

HUBERT EGERTON.

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs

AUSTRALIAN-BUILT VOITURETTE AND MOTOR-BICYCLE.

ALTHOUGH the motor-car movement has not as yet made very great progress in Australia, a number of engineers in the Colonies are busy devoting their attention to the subject. We are this week able to illustrate a voiturette and motor-bicycle that have lately been turned out from the Lewis Cycle Works of Mr. T. P. O'Grady, of Adelaide, South Australia. As will be seen, the car (Fig. 1) is of the single-

FIG. 1.

seated type, the seat being of ample width to accommodate two or three persons. The motor, which is of the air cooled variety, is situated, together with the oil tank and carburettor, in the fore-part of the frame, under the wire hood, while the electrical ignition apparatus is located under the seat. Two speeds (six and twelve miles an hour), friction drive, and free wheel are provided, manipulated by a single lever, through the agency of a belt and a double set of spur wheels. The belt connects a flanged pulley on the motor-shaft to one of three pulleys mounted on a countershaft which is carried behind the rear live axle; these pulleys are so arranged that the belt only drives when it is in contact with either of the outside pulleys. On this countershaft there are also fixed two pinions gearing alternately with either the high or low-speed spur wheels mounted on the differential shaft. The lever which controls the speeds, etc., is mounted alongside the steering column convenient to the driver's left hand, and stands normally in a vertical position. On moving it towards the seat the whole countershaft is moved laterally, and the low-speed pinion is caused to engage with its spur wheel, the belt running progressively on to one of the fixed pulleys above-mentioned. Moving the lever in the opposite direction engages the high-speed gear; when the lever is returned to its vertical position the driving belt runs on to the loose pulley, and both gears are disengaged, the motor thus running absolutely free. The control levers are mounted on the steering standard, and two brakes are provided—one a foot brake applied to the differential, the other an emergency tire brake operated by hand. The dimensions of the car are 4ft. 6in. by 4ft. wheel base; the wood wheels are 28in. in diameter, shod with 2½in. pneumatic tires.

Mr. O'Grady informs us that the car has fulfilled all expectations, having been used by some of the leading doctors and public men of Adelaide, who have been most enthusiastic in praise of the new locomotion. On account, however, of the great heat of the summer months, and of the heavy gradients of the roads through the Mount Lofty ranges, it has been decided to fit all future cars with water-cooled engines of higher power.

Fig. 2 gives a view of the motor-bicycle, from which it will be seen that the motor is carried vertically between the crank bracket and the back wheel, allowing sufficient room for the rider

to pedal the machine in the ordinary manner. The oil supply is carried in the large tank located in front of the seat column; the battery is suspended from the top tube, and the induction coil is carried immediately behind the crank bracket. The carburettor is fixed in front of the low part of the cylinder; the engine, which is of the vertical air-cooled single cylinder type, working up to 1½ h.p., drives the rear wheel through the medium of a countershaft which is carried between the motor and the rear wheel; this countershaft carries three chain wheels, the largest of which is connected by a chain to a small pinion on the motor-shaft; the remaining two are both free wheels, one being connected to the bracket chain wheel, the other to the rear hub. This arrangement permits of a free motor, at the same time dispensing with all disagreeable shock when the motor is suddenly stopped.

The motor is controlled by four small levers mounted on the top bar and the battery current can be interrupted by the usual handle bar switch; the oil supply to carburettor can be shut off by a needle valve when any prolonged coasting is indulged in or the machine left for any time. Two brakes are provided—one a front wheel rim brake, operated by the usual lever; the other back-peddalling brake. The whole machine is built specially strong to resist the strains of fast travelling, twenty-seven miles an hour having been attained over average roads. With the exception of the bicycle components and electrical gear the whole machine, including engine, has been constructed at the Lewis Cycle Works. The machine has, we are informed, been submitted to extended trials and is remarkably free from shock on account of the manipulation of the engine. In starting, the rider mounts with one pedal uppermost, and by the time the cranks have made one revolution the engine is started and pedalling can be dispensed with. In descending hills it is simply necessary to switch off current to stop the motor, and the machine becomes a free-wheel bicycle. Should it be necessary while travelling to re-start the engine, all that is to be done is to switch on the current and pedal a few turns; while, should the motor become

FIG. 2.

disabled, it is only necessary to remove the chain (not shown in the illustration) which connects it to the countershaft to permit the machine to be propelled like an ordinary cycle.

THE French Automobile Club has temporarily suspended M. Jenatzy for irregularly placing a number on his car during the recent Paris-Berlin race.

"HOW TO BECOME A GOOD MECHANIC" is the title of a pamphlet written by John Phin, author of many other well known publications connected with the workshop and laboratory, which has now reached a second edition, and is published by the Industrial Publication Company, of New York. Though much of the advice therein contained concerns educational institutions in America, many broad and general principles are laid down, which the young English mechanic, determined to rise, would do well to digest. What not to study is just as important as what to study, and on this point Mr. Phin offers some sound advice which, if followed, should save much unnecessary cramming of worthless and vexatious subjects.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

THE PINART MOTOR-CAR.

ONE of the novelties at the last motor-car exhibition in Brussels was the new light car shown by M. Ernest Pinart, of Rue des Coteaux, Brussels. The frame of the vehicle is built up of channel steel, and as it carries the engine and the whole of the transmission and other mechanism any type of carriage body can be fitted. To deal first with the

FIG. 1.—PART-SECTIONAL ELEVATION.

motor, which is placed on the fore part of the frame, this is of the vertical two-cylinder type (Figs. 1 and 2) developing 6 h.p. The crank shaft and exhaust-valve control gear are enclosed in an oil-containing chamber of aluminium. Electrical ignition is at present adopted, but M. Pinart is experimenting with a

FIG. 2.—GENERAL VIEW.

magneto-electrical device which he hopes to substitute later on for the coil and batteries. The inlet and exhaust valves are so arranged that they can be taken out for inspection or grinding purposes by the removal of a single bolt. The two cylinders are,

of course, water-jacketed, the circulation being maintained by a pump driven off the fly-wheel; a radiator is provided in connection with the water circulation. A constant level carburettor of the Longuemare or Sthénos type is used to furnish the carburetted air to the motor, but M. Pinart informs us that he hopes later on to introduce a new petrol distributor, in which all the variations in the mixture are obtained automatically.

Wheel steering is fitted to the car; immediately below the hand-wheel are two levers, one actuating the change-speed gear and one controlling the ignition. Three forward speeds and a reverse motion are available, the change-speed gear being enclosed in an oil-containing case. The foot pedal controls the reverse motion, a second pedal actuating the clutch between the engine and transmission mechanism. Three brakes are fitted to the car, the lever and pedals controlling the same being also connected up to the clutch.

In addition to the 6 h.p. cars, M. Pinart is also building 9 h.p. two-cylinder cars and 12 h.p. four-cylinder vehicles.

THE Whippet Motor Works, Falcon Terrace, Clapham Junction, have a staff of first-class mechanics thoroughly used to motor work, and are equipped with a complete plant for motor repairing.

AN 8 h.p. motor-car driven by M. Anchorena-Frias and two friends, has successfully accomplished the ascent of the Saint Bernard pass. Bearing in mind the interdict placed upon automobiles in certain parts of the Swiss republic, it is more than probable that the ascent was made from the Italian side.

A HAMPSHIRE gentleman is the inventor of yet another airship, which he hopes to complete in time to compete for the Deutsch prize. The framework of the vessel is of steel and bamboo, the balloon proper being secured to the car by stays, while the car is itself enclosed in a canvas shell, in which a door and two "ports" are placed on either side. An oil motor of the inventor's own design imparts power to a three-bladed screw propeller.

It is well known that the Hovis Bread Company, Ltd., of Macclesfield, is a very go-ahead concern. Their latest way of showing this is by purchasing an 8½ h.p. Decauville car through Mr. Reginald Egerton. The car is to be specially fitted with hood, aprons, etc., to protect the driver from bad weather, and the back part of the car is to be fitted to take business cards and other matter. The company hopes in due time to traverse the whole of England and Wales with the vehicle. We wish them every success, and shall be pleased to hear of the progress of the car from time to time.

If the plans of Mr. S. A. Miles, of Chicago, reach maturity, more than one hundred motor-cars will leave Chicago on the 31st inst., carrying a host of visitors to the Pan-American Exposition in Buffalo by easy stages. The following itinerary has been projected: Saturday, August 31st, Chicago to La Porte, Ind., 69 miles; Sept. 1st, La Porte to Ligonier, 71 miles; Sept. 2nd, Ligonier to Napoleon, 81 miles; Sept. 3rd, Napoleon to Toledo, 41 miles; Sept. 4th, Toledo to Norwalk, 64 miles; Sept. 5th, Norwalk to Cleveland, 55 miles; Sept. 6th, Cleveland to Conneaut, 70 miles; Sept. 7th, Conneaut to Dunkirk, 79 miles; Sept. 8th, Dunkirk to Buffalo, 41 miles, the journey aggregating 571 miles.

A NEW method of burning liquid fuel, called the Hydroleum system, has been shown in operation this week at the works of Messrs. Muirhead and Co., at Elmer's End, Beckenham. All descriptions of liquid hydro-carbons, from petroleum to the various tars and tar refuse, are consumed without smoke or smell, and so perfect is the combustion and so great the heat generated that a considerable saving is effected in fuel for boilers of every kind. The burner comprises a combined feed of steam and oil and the combined vapour is concentrated on an incandescent fire brick. Here the steam is chemically split up by the heat into oxygen and hydrogen, which, combining with carbon, are ignited and passed through the boiler. The process was shown in operation on a 50 h.p. Hornsby water-tube boiler, and on a steam motor-lorry.

THE AUTOMOBILE MANUFACTURING Co., Ltd., 48/49, Long Acre, and North St., Manchester Sq., all cars in stock, Garage, Repairs.

HERE AND THERE.

UNITED MOTOR INDUSTRIES, LTD., inform us that they can now furnish cycle makers and others possessing small plants with castings in the rough or finished for De Dion-Bouton motors.

A FIVE-MILE motor-cycle race was held in the Priory Park at Chichester on Thursday last week. Mr. T. S. Adcock, who had 600 yards start, came in first on a 2½ h.p. Ariel tricycle, Mr. Shippam (scratch) being second.

DRIVING from Barnes to Richmond the other day, a motorist lost control of his steering gear in a moment of inattention, with the result that the car broke down a fence and entered a private garden by the roadside before it was brought to a stand.

JOHN CHILD MEREDITH, Ltd., of Birmingham, have just issued a new list of motor cycle parts, copies of which they will send on application to any of our readers. The firm are making a speciality of water-cooled heads to fit De Dion, Ariel, and Aster motors.

A MOTOR-CAR, driven by a German gentleman, collided with a cyclist at Bromley the other day. But for the promptness of the motorist, who stopped at once, a serious accident would in all probability have resulted. As it was, the cyclist escaped without injury, though his machine was wrecked.

ON another page we reproduce a snapshot of Mr. F. J. Butterworth, accompanied by his wife and daughter, leaving Morton Old Hall, an interesting pile near Congleton, Cheshire. Mr. Butterworth is an enthusiastic motorist, and is often to be seen in his Star car in the district of Newcastle, Staffs.

IN our last issue we referred to the appointment Mr. W. Hemingway has taken up at the Daimler works at Coventry, and to the fact that for two years he conducted the cycle class at the Battersea Polytechnic. The Governing Body of that institution is now open to appoint a new instructor, not only in cycle, but also in motor construction.

MR. WILLIE JAMES, of West Dean Park, West Dean, near Chichester, who is now staying with the Duke of Devonshire, has just bought a handsome 12 h.p. Panhard car, and has already received delivery from the British Automobile Commercial Syndicate. The car is a phaeton with a seat at the back for the mechanic, and the whole is covered with a dais, with glass back and front.

BURNLEY residents are agitating for a motor-car service which would link up the outlying districts of Lane Head, Worsthorne, Rosegrove and Higham, by a sixteen or twenty mile tour. It is urged that such a service would be useful in case of fire in any of these outlying parts, and would also facilitate other municipal work, as well as transport the general public.

BAD times have fallen to the lot of the London omnibus during the past few months, and Alderman Pound had no very cheering tale to tell at the half-yearly meeting of the London General Omnibus Company. The *Daily Chronicle* considers that if the omnibus companies wish to save themselves from being run off the road by the coming "tubes," they must press the automobile into the public service.

It is surprising how quickly doctors have taken to the motor-car. One medical man in a hilly district of the North of England, who recently purchased a 4½ h.p. Renault Spider from the Roadway Autocar Company, Limited, writes that the vehicle "takes the highest hills like a bird. We can get thirty miles per hour out of her easily. She is doing my practice daily, my horses being all out to grass and for sale."

MR. D. M. WEIGEL, managing director of the British Automobile Commercial Syndicate, has just returned from Paris, where he personally inspected the despatch of one 40 h.p., six 12 h.p., one 8 h.p., three 5 h.p., and two 7 h.p. Panhard and Levassor cars. It is very doubtful if such a large number of Panhard vehicles have been sent to this country previously in one consignment. Messrs. Panhard and Levassor admit that they have never yet delivered so many cars in one order.

MESSRS. J. GREEN AND CO., of High Road, Loughton, Essex, inform us that they have become so busy with motor-repair work that they are about to lay down extra machinery.

ONE of the most vehement journalistic opponents of the automobile in the United States is the *New York World*, and yet it employs twenty motor-vehicles in its delivery department, and is adding others to the number.

MESSRS. FRISWELL, LIMITED, have opened a new branch in connection with their business at 48, Holborn Viaduct, E.C., they now undertaking the work of repainting and upholstering motor-cars.

AT the last meeting of the Bath Rural District Council a resolution was reported from Long Ashton District Council, asking that Council to adopt a recommendation to the Local Government Board to limit the speed of motor-cars in rural districts to that allowed in urban districts. The opinion was expressed that such a regulation would be unreasonable, and the clerk was asked to obtain particulars as to the speed permitted in urban districts.

The accompanying illustration shows Mr. F. W. Longmore, of Walsall, on his Speed King quadricycle, the front seat of which was made wide enough to carry two persons. Mr. Longmore,

who is an enthusiastic motorist, has nothing but praise for his machine, on which he has covered a distance of 1,500 miles in the past two months.

REFERRING to the "Auto Sparker," a full description of which appeared in our last issue, we learn that the Motor Manufacturing Company, Limited, have bought the British and Colonial rights in the device, and intend shortly fitting it to all their vehicles. They inform us that they have thoroughly tested the little dynamo and find it works excellently. There is no doubt that it will be greatly sought after by buyers and owners of motor-cars as soon as they learn of its many advantages as compared with battery and accumulator ignition.

A HORSE attached to a brougham, in which were seated Mr. A. Robinson, of Bell Castle, Kemerton, and a friend, took fright on meeting a motor-car at Bredon one day last week. The animal turned round, and at the same time the coachman was thrown from the box. The horse then galloped off at full speed in the direction of Tewkesbury, where a girl with a street organ, seeing the horse approach without a driver, ran to its head, and held it until some men came to her assistance. The coachman was conveyed to Tewkesbury on the motor-car, and taken to a surgery, where his injuries were attended to.

MR. W. LAWLEY, of Swansea, recently drove Councillor P. D. Evans (the ex-Mayor) and a party along the beach road to Aberavon, a village never before visited by a motor-car. Local enthusiasm ran high, and far-seeing people predict a regular service between the two places.

THE forthcoming speed contest on the beach at Deauville, France, promises to be an exciting meeting. So far thirty-one entries have been received, Mr. S. F. Edge having entered two cars, a 16 h.p. Napier and the well-known 50 h.p. vehicle. M. Tart has entered a new 26 h.p. Clement car said to weigh 13cwt.

WE looked in at the dépôt of the Motor Mart in Euston Road, N.W., the other day, and learnt that there is quite a brisk demand just now for second-hand cars, Panhards, Daimlers, and De Dion voiturettes being in principal request. Steam cars also are in good demand, and any sent to the Motor Mart for sale do not remain there very long.

AT Newlands Lodge, near Belford, Berwick, on Saturday last, while Mr. Swinton, a London engineer and a guest of Sir Andrew Noble at Chillingham Castle, was riding a motor-bicycle he approached a young horse. As the animal refused to pass the motor he turned it into the hedge. William Tarbet, aged twenty-seven, who was riding the horse, dismounted to lead it past the machine, when the animal became restive, and, rearing, kicked Tarbet over the heart, causing instant death.

THE Midland Motor Agency, of Ladywood Road, Birmingham, is extending its useful operations. A large assortment of motor-cars, new and second-hand, are always in stock. The Agency's large premises and modern plant offer every facility for speedy repairs. Every convenience is offered for cleaning, lubricating, charging, and storing cars; competent drivers are also available. Cars for sale or exchange may be left at the Agency or placed upon its register.

AT the opening of the new rifle range at Conway, the other day, Lady Dundonald and Lord Cochrane were driven from the marquee, after his lordship had fired the first shot and been presented with the rifle used, by Mr. Wm. Johnson, of Waver-tree, in a motor-car to and from the butts, where the working of the revolving targets was explained to her ladyship, and the provisions made for the safety of the markers pointed out. The car used was a Dechamps victoriette, and the ground was considered too rough and bumpy to take a carriage over. On the return to the roadway her ladyship expressed herself as being very pleased with the ease with which the vehicle travelled.

ONE of the latest types of motor-cycle is the Mitchell, an American machine which is being introduced into this country by Messrs. Davis, Allen, and Co., of Singer Street, London, E.C. The frames are built especially for motor-bicycle purposes on the

lines of the regular bicycle frame. Besides the extra heavy material used, all points liable to strains or breaks are reinforced, so that the frame is sufficiently strong to withstand the additional weight and high speed. The motor is of special design, and develops $1\frac{3}{4}$ h.p. at a speed of 1,800 revolutions per minute. It is carried over the lower tube of the frame, and drives the rear wheel by means of a strap working on pulleys. The machine can, it is claimed, attain a speed of thirty-five miles per hour.

THE London Autocar Company, of Gray's Inn Road, W.C., appear to be laying themselves out on a large scale to cater for the demand for motor-bicycles which has so suddenly sprung up, for they have no less than three types of machines on hand. The first of these is the Moto-Sacoché, of which an illustrated description was given in a recent issue. Next we have a Minerva pattern motor-bicycle, and then we have the "Universal." In the latter machine a somewhat new arrangement is adopted. As we hope to give a full description in an early issue we need only now mention that the engine, which is of $1\frac{1}{2}$ h.p., is carried in front of the main down tube of the frame, transmitting its power

by a crossed strap to a small pulley carried on a special support on the rear frame. Combined with the latter pulley is a small pinion which gears with a larger pinion fastened rigidly on the hub of the rear wheel. Although the large pinion is additionally attached to the spokes of the rear wheel, the fact that the power is transmitted through the hub as well as the spokes relieves the latter of considerable strain.

MR. A. DUNHILL, of 145, Euston Road, London, N.W., who has for some time been making

a speciality of motor clothing, has recently added a number of new lines in this department. Prominent among these are light dust coats made of holland. These are made for both ladies' and gentlemen's use, and, being loosely fitting, allow the air to circulate freely. The collars are of a special shape, covering, when turned up, almost the whole of the back of the head, and yet not projecting uncomfortably at the front. The ladies' dust coats are made in two styles, one having sleeves and the other having a cape in place of the sleeves. Another new thing we were shown was a special driving apron made of leather and cloth. The feature of this is the insertion of a V piece in the centre, which allows plenty of room for movement of the legs while keeping them covered. Mr. Dunhill is devoting attention as much to ladies' requirements as gentlemen's in the way of leather clothing; a new production being a cloth-lined leather skirt. In goggles a wide range is offered, including a new pattern in which large glasses are made use of, these being so arranged as to allow the user good side views as well as straight ahead.

THE scheme for running one or two public service motor-cars in the Tring district is at present in abeyance.

A TURRELL $4\frac{1}{2}$ H.P. CAR ASCENDING A GRADIENT OF 1 IN 4 FROM STANDING START.

THE BIG EVENT OF 1901.

BELOW we give a complete list of the entries that have so far been received for the reliability trials at Glasgow, which commence on Monday, September 2nd.

SECTION I.

Motor-vehicles entered by their Manufacturers or by the authorised Agents of Manufacturers.

Class.	Official Number.	General Description.	Manufacturer or Agent.	Number of Passengers, including Driver or load.	Brake Horse Power.	Weight unladen.

*This vehicle is being run with a view to obtaining an official certificate from the Judges' Committee.

†This vehicle is not being run with a view to obtain an official certificate, and the Judges' Committee have no knowledge as to what repairs or renewals (if any) are effected, or changes made in the vehicle between the daily runs, as it remains in the hands of the owner and not in the custody of the Judges' Committee.

The entries in Section III.—parts of motor-vehicles—are given on another page.

FURIOUS DRIVING CASES.

At Hastings, Edward Rogers was summoned for furiously driving a motor-car. P.S. Taylor said that at 4.55 p.m. on the 4th inst. he saw defendant driving a motor-car in London Road, St. Leonards. Defendant was driving at fourteen or sixteen miles an hour. When told he would be reported, defendant said: "My brake was on fire and I was afraid to use it." Frederick Warren gave corroborative evidence. Defendant said his machine was perfectly under control. Fined 10s. and costs.

At Epsom, Harry Green was summoned for driving a motor-tricycle at a furious rate at Epsom Road, Ashted, on July 25th. Police-constable Bourne stated that at 8.45 p.m. on the date named defendant passed him

on a motor-tricycle riding at the rate of about eighteen or twenty miles an hour. About forty yards further on he met with an accident, which witness attributed to his fast riding. Defendant at first gave the name of Nelson, but afterwards gave his proper name and address. Mr. Schultess Young, barrister, who appeared for the defence, called witnesses to show that before the constable saw defendant his machine ran into a hole six inches deep, which threw the whole mechanism out of order, and he entirely lost control of it. Before he could get it under control again he passed over another hole which caused the accident. The learned barrister contended that as the furious driving was not wilful but accidental, defendant was not liable. Defendant was fined £1 and costs.

At the Shrewsbury Borough Police Court, Carl Lawton, of Mossley, near Manchester, was summoned for unlawfully driving a motor-car furiously, so as to endanger the life or limb of any passenger on the highway at Mardol, Shrewsbury, on July 23rd. Defendant did not appear. Police-constable Embrey stated that about 8.40 on the evening of July 23rd he saw the defendant driving a motor-car at a very fast rate. Witness considered that the car was travelling about fourteen miles an hour, and defendant was also steering very badly, the car running from one side of the street to the other. Witness held up his hands and shouted to the defendant to stop, but he took no notice whatever. There were two other young men on the car, and witness followed it down to the Hill's Arms, where the car was stopped for the occupants to obtain refreshments. Defendant gave his name and address, and said that he had not seen witness at all. Edwin Gwilliam, general dealer, Mardol, and Joseph Davies Birch, hairdresser, gave corroborative evidence. The Bench imposed a penalty of £2 and costs.

At Boston, Robert Herbigde, of Nottingham, was charged with having driven a motor-car at a greater speed than fourteen miles an hour between Skirbeck and Wrangle, on August 3rd. Mr. Gane appeared for the defendant, and stated that Mr. Herbigde was in Belfast, and had only just received the summons. He asked that the case might be adjourned to allow of his attendance. The chairman adjourned the case for a week.

At Portsmouth, Benjamin Joseph Lamb, of Southsea, was summoned for furiously riding a motor-car on the Clarence Parade on the evening of the 3rd inst. Police-constables Pratt and Sturgess deposed that defendant drove from Florence Road to the Corinthian Yacht Club at a speed of fourteen miles an hour. Defendant said the motor-car could not possibly exceed twelve miles an hour, and he was not driving at full speed. The Bench imposed a fine of 20s., including costs.

At Lyndhurst, Ernest Powell King, J.P., of Wainsford, Lyndington, was summoned for driving a light locomotive on the highway in Gosport Lane, Lyndington, at a greater speed than fourteen miles per hour, to wit, twenty-two miles, and pleaded not guilty. Police-constable Osgood, stationed at Lyndhurst, deposed that on July 17th, about 7.25 p.m., he was on duty in Gosport Lane, Lyndhurst, and saw the defendant driving his motor-car towards Brockenhurst at a high speed. He timed him between certain places in the road, which he covered in 31 seconds. He afterwards measured the distance, which was 341 yards, and it worked out at a speed of just over twenty-two miles per hour. Further cross-examined, witness said he timed with the second hand on his watch, and he measured the distance with a chain. He could see the whole of the 341 yards without interruption. The car had passed him before he took out his watch. It had got about thirty yards before he did so. John Woods, a grocer's assistant, corroborated. The defendant, in defence, urged that the charge of travelling at the rate of twenty-two miles could not be substantiated, and that he had no case to answer. The Bench considered he had, and defendant then commented on the evidence as being of a vague character, and not sufficient to convict. Thomas Strickland, a carpenter, of Wainsford Common, was called for the defence. He said he was with the defendant in the car, and he believed the constable was under an erroneous impression with regard to the speed. They were not going more than eleven or twelve miles per hour when the constable saw them. The court was then cleared, and on the readmission of the public the chairman said the Bench were of opinion defendant was guilty of the offence with which he was charged, and he would be fined £5 and the costs, 12s., which he paid. Mr. King said he might appeal after consulting his solicitor.

A NON-STOPPING CASE.

At Blackpool County Court, Joseph Wm. Nicholson, cab proprietor, of Blackpool, claimed £14 8s. 2d. from Edward Ireland, photographer, of Manchester, for damages sustained through the negligence and furious driving of the defendant's motor-car near Cleveleys, on June 9th last. Mr. Callis, for the plaintiff, said that on June 9th plaintiff was engaged by Mr. Phillips, of Warbreck Road, to take his family for a drive. About 2.30 in the afternoon the party left in a one-horse landau and a four-wheeled dog-cart. They went through Bispham on to Cleveleys. The plaintiff was in front with the landau, and the dog-cart was forty or fifty yards behind. They were going at the rate of about six miles an hour in the direction of Rossall College. There was a bend in the road, then a long level part leading to Rossall College. When the plaintiff got about forty or fifty yards this side the bend he saw up the road, a considerable distance, a motor-car coming along at a furious rate. He put up his hand, but the car did not stop, and he drew the landau right up to the hedgeside. As it came on the horse attached to the landau jumped the hedge with the conveyance, while the dog-cart behind drew right across the road, which brought the motor-car to a stand. Mr. Callis pointed out that the defendant had com-

mitted a breach of the regulations under the Act, which provided that a motor-car driver was bound to stop if a man put his hand up. Joseph William Nicholson, after corroborating his solicitor's statement, said that when he had freed his horse he went back to the motor-car, and found that the occupants were Mr. Ireland and his son, Mr. McKenzie, and Mr. Hanson, electrical engineer. The party were taken to Cleveleys police station, where the names were given. Mr. Newman, for the defendant, called several witnesses, who deposed that the motor-car was travelling at a moderate rate of speed, and that it was still further slowed down on approaching the landau. His Honour said that he had to settle whether the damage which had undoubtedly come to the plaintiff was caused by the negligence of the defendant, or his son, who was driving this motor-car. Dealing with the allegations as to speed and the noise of the motor, he said that in many cases motors made a noise quite out of proportion to the pace they were going at. He believed this car was travelling ten or twelve or fourteen miles an hour. The case for the plaintiff had been somewhat spoiled by exaggeration. He had to read between the evidence what he believed to be the real facts of the case. It rested a great deal on the evidence of the driver of the car. When he saw the driver of a restive horse holding up his hand he would be bound to pull up his car at once. What did he do? He believed it to be a fact that he came round the bend and went on for some time at slowing-up rate, then he brought the thing to a standstill within ten yards. He gave a verdict for the plaintiff for the amount claimed.

REFUSING TO STOP.

DR. LEVI FARNDON, of Maidenhead, appeared in answer to a summons taken out by a fly proprietor named Joseph Southwell, for not having stopped his motor-car whilst he was passing with his horse and vehicle in Queen Street, on July 21st. The complainant, who resides at Brighton, said that he was a fly proprietor, and on the day in question he was driving a brown mare in a landau down Queen Street. Mr. Herbert Smith was in the vehicle. When near Mr. Truscott's he saw the defendant coming up Queen Street in his motor-car. He put up his whip in his hand as a signal for defendant to stop; he did not do so, but came on past them. As a result of this his horse made a plunge and swerved on to the curb. It was a restless animal, which was the reason that made him give the signal for defendant to stop. He thought that the defendant must have seen him give the signal. When the horse swerved they had a narrow escape of being smashed up. As far as he could judge, he should say the defendant was going eight or nine miles an hour. After hearing further evidence, the Mayor said that the magistrates had decided that the case had been proved, and they imposed a fine of 10s., with 13s. 6d. costs.

AN APPEAL CASE.

At Forfar Sheriff Court last week Sheriff-Principal Johnston heard an appeal by Mr. Alexander Ross French, Forfar, against the judgment of Sheriff Lee in the action at the instance of Mr. James McFarlane, cycle and motor-car dealer, Perth, against him, concluding for £135 as the price of a motor-car which the alleged defender bought from him. On the case being called there was no answer by the defender, and the Sheriff accordingly dismissed the appeal and adhered to the Sheriff-Substitute's decision, with additional expenses.

NO LIGHT.

At Kingston, F. Creese, of Fulham, was summoned for riding a motor-tricycle on the Portsmouth Road, Long Ditton, without exhibiting a light, at 12.25 o'clock on the morning of August 3rd. Police-constable Saunders proved the offence, stating that when he pulled defendant up he stopped and lit his lamp, which had gone out. Defendant did not appear, and was fined 15s. Before the court rose defendant put in an appearance, and the fine was reduced to 10s. Defendant: I have got no money. The Chairman: Well, you must go to prison. Defendant: It isn't fair. I had a light, but it had gone out. I shall never stop again when anyone asks me. The Chairman: A distress warrant will be issued, and if you don't pay you will go to prison.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, AUGUST 31, 1901.

[No. .

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

LAST week we referred to the ardour with which His Majesty the King was indulging in automobilism at Homburg, and recorded some notable journeys made by him. Since then other trips have been taken, and on Friday after going by train to Cassel he returned to Frankfort by the same means. There he dined, continuing his homeward journey to Ritters Park Hotel, Homburg, in his automobile. On Sunday a motor trip was made to Friedrichshof; on Monday Nauheim was visited, while on Tuesday His Majesty paid a visit *en automobile* to the Grand Duke and Duchess of Hesse at Wolfsgarten, near Darmstadt. By the courtesy of the *Morning Leader* we are able to reproduce two snapshots, one of the King's Daimler car awaiting its Royal owner at the Ritters Park Hotel, Homburg, and the other shewing the car travelling along one of the main streets of the town with the King on board.

Our New Car.

LAST Saturday was the first day we had an opportunity of testing our new 9 h.p. Napier car, and so gladly took advantage of the occasion for a run through Mid-Sussex to Brighton. On the following day we journeyed *via* Arundel and Box Hill back to London, the car travelling splendidly the whole while, no stops being made except for luncheon and tea. At Brighton several motorists were met; while on the way to Shoreham, a Mabley car was observed travelling quickly, with three passengers up. At Arundel a 6 h.p. Panhard was seen, and about two o'clock Mr. Gretton drove into the yard of the Norfolk Hotel on an M.M.C. voiturette with four up. The little car was travelling strong. At Burford Bridge Hotel the Rev. Mr. Wharton was seen, he having driven down the previous evening on his Canello-Durkopp. The roads were in splendid condition and there was very little dust to interfere with our comfort. The new car having behaved so well on what was practically an initial run, it was with pleasant anticipations that we set out from town early on Wednesday for the North. Notwithstanding a strong cold headwind the car safely landed its four passengers and a quantity of luggage at York the same evening, the net running time working out at only eleven and a-half hours.

The Yorkshire Automobile Club.

THE tenth run of the Yorkshire Automobile Club was held on Saturday last, the destination being Bolton Abbey. The weather was splendid and the roads good, so that a very enjoyable time was passed in admiring the beauties of the country surrounding Ilkley and Bolton. The following members took part:—Mr. T. E. King (vice-president), on a Century Tandem, and a friend on a Locomobile; Mr. Bishop, on an Enfield motor-tricycle; Mr. Hey, Bradford, on tricycle; Mr. and Mrs. Burrows,

Leeds, on a Star car; Mr. F. J. Borland and Mr. Wood on an M.M.C. tricycle and trailer; and Messrs. A. W. and E. Dougill on a Lawson motor wheel.

More Police Tactics.

At the North Holland (Boston) Police-court last week, Mr. Robert Harbidge, of Nottingham, was summoned for furiously driving a motor-car on the highway between Skirbeck and Wrangle on August 3rd. Mr. Welles Lucas, of Nottingham, defended. P.C. Cook said he was on the high road in the parish of Butterwick on Saturday afternoon, August 3rd, on the lookout for motor-cars. Defendant drove past the fourth milestone from Boston at 6.43. Witness jumped on a bicycle and followed him, and saw him pass the fifth milestone at 6.46, the rate being twenty miles an hour. Sergeant Drinkall, who was stationed at the fifth milestone, said the defendant was only driving at the rate of twelve to fourteen miles an hour when he passed him, having slowed down to turn a corner and on account of the traffic on the road, but witness heard him travelling at an excessive speed before he saw him. He was of opinion that a motor made the more noise the faster it went. P.C. Eastgate, who was stationed a mile-and-a-half lower down the road, said defendant passed him at 6.58. This was eleven minutes after he passed Sergeant Drinkall, and Mr. Lucas pointed out that one-and-a-half mile in eleven minutes could not be considered excessive. Sergeant Drinkall estimated the speed at anything from twenty to thirty miles an hour, and P.C. Eastgate put it at twenty-six miles. The magistrates stopped the case. They had no doubt that the speed was excessive, but the evidence was very unsatisfactory, and the case was dismissed.

An Important Case.

THE above case is of greater interest to the users of motor-vehicles, and indirectly to the general public, than might be supposed. The defence of Mr. Harbidge was undertaken by the Nottingham and District Automobile Club. The failure of the prosecution was, so Mr. A. R. Atkey, hon. sec. of the Club, informs us, not due to any lack of witnesses—there being half a dozen stalwart constables produced—nor to any shortage of evidence, there being a surfeit thereof. It was, however, another instance of “too many cooks,” for in the hands of the Club's solicitor, Mr. Welles Lucas, “the force” got very mixed in their statements, and, finally, *reductio ad absurdum*, caused the Bench to stop the case without calling for any witnesses for the defence. The fact remains, however, that had the police proved to the satisfaction of the Bench that the defendant was exceeding twelve miles an hour, a conviction would undoubtedly have followed. Hitherto the law as to the limit of speed has, in the Nottingham district at any rate, been used only for defensive purposes, where drivers of motor-vehicles have in some way prejudiced the rights or endangered the safety of others. In the case under notice, however, not one of the witnesses for the prosecution even suggested the slightest danger to any third person. The road was absolutely clear, even of one of the sets

of "official timekeepers" who presumably thought that more accurate observations could be taken from the seclusion of a dry dyke.

The Numbering Question Again.

At the last meeting of the Keynsham Rural District Council, a communication was read from the Long Ashton Rural District Council asking the Council to support resolutions passed by them urging the Local Government Board to regulate the speed of motor-cars in rural districts to that driven in urban districts, and the necessity of having each car licensed and numbered, the mark being on the front and back in plain figures at least six inches long. The Chairman thought that perhaps it would be wise that each car should be numbered, because a policeman could step in front of a bicycle and stop it if it was going at too great a speed, but it would require a very bold man to step in front of a motor-car. The motion was adopted.

SNAPSHOT OF MR. W. JOHNSON DRIVING LADY DUNDONALD AND LORD COCHRANE ON A DECHAMP CAR.

Mails by Motor-Vans.

JUST as astonishing as the colossal figures of a year's Post Office work, recently published, is the statement that the department has so far failed to find the motor-car a workable adjunct to its vast operations. In the report for 1899 it was stated that experiments made during that year in the conveyance of mails by motor-vans had proved unsuccessful, and that no permanent motor services had been established. Since that time some further experiments have been made which, unfortunately, have also proved unsuccessful, but although it has not yet been possible to establish any motor mail service, there are hopes, in view of the recent development of motor locomotion in this country, that a vehicle capable of performing a regular and continuous service over an extended period may before long be secured. Such a confession savours of timidity and weakness difficult to understand in an organisation which last year handled with marvellous success 3,723,817,000 letters, cards, and packets. The speed and economy of the motor-car are proved by the many private firms which have adopted it as the sole means of collecting and delivering goods. A motor-van capable of running straight from St. Martin's to the provincial post office fifty or one hundred miles from town with a ton or so of mails will appeal to any thinking man as more expedient than the present system—two or three carts at each end and a train in the middle. Well for the Post Office and the public that steam had the start of it, else to this day might we see our foreign mails carried by the slow but sure sailing ship.

Useful Tips.

ONE of the big dailies which publishes on Saturdays some useful hints to cyclists has formed itself into a self-constituted commission to investigate the question of damage done to roads by motor-cars. Its local correspondents have been invited to furnish information on the subject and have unanimously reported that the motor-car does no harm to road surface. It hardly requires twenty-one reports from various centres, which fill half a column, to convince the most prejudiced foe to the motor-car of this. But what is of interest is that in some quarters cyclists are warned to beware of motor-cars, which are numerous. The exact danger to guard against is not stated. We can only surmise that it is the old evil of "hanging on" to the motor-car, an evil which we have constantly pointed out, that the correspondents refer to. But why not be a little more explicit? The too ambitious cyclist who dogs the tracks of a motor-car in his attempt to keep pace with it runs a very serious risk. Let the car slow up or stop suddenly and the cyclist must choose between two evils—charging the rear of the car or swerving wildly across the road. Had the important organ devoted a few lines to this real danger in place of a half column investigation of a purely imaginary evil it would have benefited all who use the road.

Southsea.

SOUTHSEA and Portsmouth have not forgotten the run of the Automobile Club last year, and many people there are looking forward to the next organised motor-car trip to those pleasant towns. "On Saturday," writes a contributor to the *Motor-Car Journal*, "I spent a few hours on Southsea Common and saw half a dozen cars, four motor-tricycles and a Werner motor-bicycle travelling along the front in good style. The motor-wagonette that plies between the South Pier and the Clarence Pier was doing good business. Messrs. Rose and Company and Messrs. Cox and Company, Ltd., both of which firms have establishments in the Castle Road, Southsea, seem to be pushing the motor-car business with energy and spirit, the former making a great feature of the Daimler and Benz cars, and the latter of the Motor Manufacturing Company's vehicles, the De Dion voitures and the Werner motor-bicycles."

Proposed Public Service in Scotland.

IN the course of an interview last week with Provost Mackie, Leith, it was stated that arrangements are being made by the Kingsburgh Motor Works, Ltd., at Granton, for the starting of a thorough service of motor-cars between Bernard Street, Leith, and St. Andrew Square, Edinburgh. The cars, it is intended, will carry twelve passengers at a charge of 1½d. per head, and the run will be accomplished, it is expected, in about a quarter of an hour. The Provost and some members of the Corporation had a run through Barnton last week in one of the cars, and reported themselves well pleased with the vehicle. It is the company's intention to apply at once to the magistrates for the necessary licence.

Getting Away from Town.

MOTORISTS desirous of going from London to country towns are finding great difficulty in getting safely from the Metropolis, for barricaded thoroughfares and over-vigilant police are doing their best, or their worst, to make difficult the way of the motorist. A glance at some of the main roads out of London will cause the provincial automobilist to feel some sympathy with his London brother. The antipathy to motor-cars evidenced on the great North Road is notorious. On the Bath road trams have to be encountered as far as Hounslow, and, the tram metals safely negotiated, the police have to be propitiated by a slow funeral pace for fear of exaggerated speeds being sworn to in police-courts. Uxbridge road presents the tram difficulty as far as Southall, and then "scaffold poles" are met with—adding to the terrors of the motorist. Eastward the main road to Chelmsford presents a vile and vicious surface till the extremities of the London

suburbs are reached and then local authorities and the police conspire to instil dread and fear in the heart of automobilists. Even in Epping Forest the police are as officious as elsewhere. Surrey, which should have been educated to a higher encouragement of the automobile, is as retrograde as other counties, and watchful and unnecessarily careful must the motorists be who go on the Ripley or Reigate roads, while even the well-worn Brighton road is, just now, up for trams at Croydon, and expert management of cars is there essential. In fact, looking around, the safest way of leaving London is by the Edgware Road to St. Albans—a hint which will be useful to drivers who have not got beyond the early stages of motoring. Police, trams, local authorities, and small boys all seem combined in an attempt to harass the passing motorist.

Small Boys.

WE have added small boys to the list because there seems an epidemic among them just now. The habit of throwing their caps under the wheels of the motor-car is fashionable among London gamins, and no reasonable explanation of the disease seems forthcoming. Many suggestions have been made,

two vehicles has, we understand, already been secured. It is also proposed to connect Guildford, Godalming, and the neighbouring villages with a motor service for passengers. From Worthing, too, we learn that Mr. Hollis, of the Nurseries in South Farm Lane, purposes having a motor-car early next year for the transport of fruit to London, and he is in communication with the makers on the subject at the present time. He considers the cost of sending fruit by rail is excessive. It costs more for fruit to be sent from Worthing to Covent Garden than it does from Guernsey to the same place.

The Tour of an Electric Car.

As mentioned in a recent issue, the "Powerful" electrical car of the British and Foreign Electrical Vehicle Company, Ltd., is being driven by road to Glasgow. London was left on Wednesday morning of last week, and Peterborough reached the same evening, where the batteries were re-charged at the Corporation station. The next afternoon the motorists set out for Grantham, and on Friday, Sheffield was reached. The party on the car, which consists of the managing director of the company (Mr. Theodore G. Chambers), Mr. Conrad Cooke, and Mr. Theodore

The Royal Car awaiting the King at Ritter's Park Hotel.

The King off for a Sign

THE KING AT HOMBERG.

and one given in the *Daily Chronicle* has the charm of novelty if little of the character of accuracy. "The caps are not sacrificed," says our contemporary, "from any fanatical motive of propitiating a modern Juggermout, but simply in order to gratify a new sensation on the part of their youthful owners; for it is no uncommon sight, after an automobile has gone by, to see a row of boys with their faces buried in their caps, inhaling the fumes of petrol with all the abandonment of the opium-eater. We wonder whether this strange pleasure is about to become the new craze of the youthful smoker, who has called so long for legislation—and has just got it, in the States."

Goods and Fruit Transport by Road.

A SCHEME is under consideration for the establishment of a motor service for West Surrey. The proposal is to institute a goods service between Guildford and London, and to run two steam wagons with a total capacity of ten tons, thus affording a daily service at, it is calculated, rates considerably lower than the railway charges. Sufficient goods traffic to employ

Jones, and one of the company's skilled drivers, Mr. Jead, were entertained at Ringwood Hall by Mr. T. Bayley, M.P. The journey on Saturday extended as far as Bradford, where a stay was made over the week end. On Monday a start was made for Lancaster. This proved to be a difficult day's journey, the roads being bad and the gradients severe. For some time the party were delayed by a heavy thunderstorm, but eventually Lancaster was safely reached. The last we heard of the car was on Tuesday, when on its way to Carlisle. The event is one of some interest, as this is the first electric car that has been on tour through England.

Extent of a Landlord's Liability.

A CURIOUS case referred to some weeks ago, in which the point at issue was the extent to which an inn proprietor may be considered liable to find accommodation, occupied the attention of Judge Martineau at Redhill last week, and, as the judge frankly admitted, puzzled him. As will be remembered, the Chequers Inn at Hookwood, near Horley, was the

first scene of an incident which has already claimed the attention of two courts, and may be taken to a third. On a wet evening or early morning of April last, Mr. R. Brown and a friend found themselves stranded in that inhospitable village with a broken-down motor-car. Naturally, the inn was approached in the hope of shelter; but mine host bade the belated travellers begone, as he had no accommodation. Refreshment was next demanded, and this was supplied. Once inside the inn the travellers renewed their request for shelter, offering to pass the remainder of the night in the coffee-room. Having done all which in his opinion the law demanded, mine host declined to have his dwelling-rooms converted into sleeping apartments, and urged the travellers to leave the house. Angry words were followed by a threat to turn the unwelcome visitors out, and ultimately they left, found a fly, and drove to Crawley. The action was brought before Judge Martineau by Mr. Brown, who sued the landlord of the Chequers Inn for £25 damages—the hire of the fly, and expenses resulting from illness caused by exposure. Again mine host protested that his bedrooms being full he had no accommodation within the meaning of the word, and was not legally bound to find any of a makeshift order. In finding for the defendant with costs, after much deliberation, his Honour concurred with that view of the case. Though this may be the legal view, it is neither humane nor consistent with the traditions of an English inn.

The War Office Motor-Vehicle Trials.

At the last meeting of the Aldershot Town Council a number of communications, accompanied by a long letter from the War Office, explaining the important trials in steam transport which are shortly to be made, and asking the Council to modify certain of their bye-laws to permit of the making of the trials over roads in the urban district, were considered. The chief concessions asked were the allowing of the engines to pass over bridges and the raising of the limit of speed permissible. The surveyor announced that he had considered the letter, and had prepared a report on it. He suggested four conditions upon which the permission could be granted. These were: (1) That the vehicles should be stopped on the approach of a man on horseback; (2) that in the populous districts the speed should not exceed that usually allowed; (3) that notification should be given that the canal bridge in Farnborough Road was unsafe for heavy traffic; (4) that the War Department should be held liable for any damage. A long discussion ensued, which was summed up by Mr. Friend, who felt there were three things which should be mentioned in the reply to the War Office: (1) They should ask for notice of the time of the trials; (2) there should be a suggestion as to the speed to be observed in passing through the town; (3) the fact that the canal bridge was unfit for heavy traffic should be pointed out. One or two of the Councillors were still unsatisfied, but the majority were in favour of the precautions suggested by Mr. Friend, and a resolution to that effect was passed.

The Irish Automobile Tour.

In the course of a letter to us Mr. R. J. Meccredy reports that the Irish Automobile tour has proved a very great success throughout, but it has been a disappointment that so few members of the English Club took part in it, elaborate preparations having been made for a large number. The fact that there was an interval of ten days between the end of the tour and the Glasgow trials is no doubt responsible for the absence of many Club members, it having been arranged originally that the one event should follow immediately on the heels of the other. A great many of the tourists returned from Connemara. There were seven cars, however, on the road at Enniskillen; four of these returned northward, so that only three took part in the last day's journey and completed the entire programme. These were Mr. Bucken's 7 h.p. M.M.C. car, Mr. Meccredy's 9 h.p. Daimler, and Mr. Wells' Werner motor-bicycle. All three did excellently throughout the tour, and gave exceedingly little

trouble. With regard to a report that the weather was unpropitious, Mr. Meccredy adds that this is entirely contrary to the facts. During the sixteen days' tour there were two completely wet days. One was an off day, when there was no official programme, and the other was the Saturday on which the tourists arrived in Connemara; otherwise the weather was splendid. Occasional showers at night completely laid the dust without wetting the road surface.

Motor-Cars and Horses.

SIR HENRY THOMPSON has started a useful discussion in the columns of the *Times*, and several correspondents have written to endorse his remarks, on the treatment of horses when meeting motor-cars. Like many other eminent men, Sir Henry has taken to motoring. He has not only been a passenger but he has been an observer, coming to the conclusion that the danger from shying horses is much more due to the action of the driver than to the animal itself. In nine cases out of ten the driver fears, not unnaturally, that his horse may shy, and begins to pull the reins tight and to lash him severely with the whip, to force him to meet the coming car, thereby making him nervous and excited. This is the worst possible preparation for the encounter. The horse ought, according to Sir Henry Thompson, on the other hand, to be gently checked in his speed, the whip should be untouched, and the near rein a little tightened so as to cover the eye with the off-side blinker, and prevent the animal from seeing the car as it approaches, at the same time addressing a word of friendly encouragement to the animal. It is a complete illustration of the truth of the old proverb, "You may often lead when you cannot drive."

Patience Wanted.

THIS is the view frequently emphasised in these columns, and the endorsement it receives from several correspondents leads us to hope that it may be generally accepted. If drivers of horses would have a little courage and exercise a little patience the education of the animals would proceed much more rapidly. If Sir Henry Thompson's advice was universally adopted the talk about numbering motor-cars and examining their drivers would soon flicker out.

Ladies and Motor-Cars.

SOME months ago a young lady motor-bicyclist made an effort to found a club for lady automobilists. Several papers were written on the subject; Lady Harberton lent her drawing-room for the purpose of a meeting; and then the enthusiasm of the pioneers evaporated. They will be glad to learn that a suggestion now going on among the members of the Reading Automobile Club may result in some concessions to the fair sex. It is suggested that "lady associates" should be a possibility, and that occasional "ladies' days" might be arranged, when the men would step aside and the ladies would control and organise the events. The interest of ladies in automobilism is one of its pleasing attractions to Society, and the idea thus cautiously mooted is likely to be better supported than the earlier campaign, which did not seem to have much sympathy from those fair automobilists who have enjoyed the pleasure of participating in the trials and runs of the Automobile Club.

THE Locomobile Co. of America have received a letter from a British officer at Middleburg, in the Transvaal, in which he states: "The first person I met on getting out of the station here yesterday was on a Locomobile, which is the property of Lieut. Walker, of the Royal Engineers. He uses it greatly and also drives the dynamo of the searchlight from the back wheel by propping up the car."

THE "GOOD GIRL."

THE Right Hon. Sir J. H. A. Macdonald, K.C.B., Lord Justice Clerk of Scotland, has kindly furnished us with the following account of the run of his new Delahaye car from Paris to Scotland:—

Having arranged with my friend Dr. Dawson Turner to pilot me homeward with my Delahaye on the journey from Paris to Scotland, we left the works on a beautiful afternoon, carrying one passenger, the Rev. Canon Woodward, who went to Paris with us that he might have a first experience of power traction. She rode gaily till we came to the terrible *pavé* beyond the Arc de Triomphe, which tested everything but too thoroughly in the new carriage, with the best results, as a plate of the band brake, being too hard and brittle, broke. Back to the works for half-an-hour, and then we started indeed. Leaving the barrier by

tide at 4 a.m. Right well did she respond, and carried us without a hitch to St. Pol for *déjeuner*. On passing through Amiens we gave the car a feed of fuel, and watered her well. At St. Pol much discussion with the locals regarding our route ensued, they insisting, with many friendly gesticulations, on a westerly line, while the printed directions for the Paris-Ostend race gave a more easterly route. It was a balancing of arguments. The doctor, with his great and justifiable faith in Secretary Johnson, who had kindly lent us his itinerary of the race, had leanings to the east, but some subtle instinct inclined me to the west. The canon was neutral. Returning to the inn for a moment, I met another gentleman, a palpable cyclist, judging by the cycle wheel that hung from his watch-chain. "To him the question I referred," as did the disputants over the chameleon's colour, and he turned out a decided westerian. This settled the question so far. On we sped, doing [splendid running, but still calling regularly on the canon for oil from time to time. The

THE RIGHT HON. SIR J. H. A. MACDONALD, K.C.B., LORD JUSTICE CLERK OF SCOTLAND, ON HIS NEW DELAHAYE CAR!

5.30 p.m., we reached Beauvais at 8 p.m., having done, including the double journey through Paris, about 62 miles in all. I need not say that, being a novice, I did not do any driving, but learned much by watching the doctor, who made her go when it was safe, but is a model of caution when any traffic or road turn is encountered. That the pace was good will be realised when I mention that we stopped four times on the road to oil and grease at every point, so as not to run any risk of the new bearings over-heating. Of this work we all took a share, the canon pouring in oil, as doubtless he is well accustomed to do to brethren who heat too readily, when friction arises from ruffled surfaces.

The good old Hotel d'Angleterre, the best compliment to the cheer of which is that there is very little of the country town inn of Angleterre about it, sent us off fresh and lively at 7.30 next morning to accomplish the long run to Dunkirk, where my lady was to embark for her first sea voyage. Again the doctor drove, for time was all-important, and the car was to be called upon to do her very best, as the steamer was to leave with the

result of this was that we had no serious heating, although the pace was up to all the car's capabilities, which are quite fast enough for your humble servant, and he is inclined to say fast enough for any being who has not a natural craving for a smash-up of the complicated machinery of man and beast—I mean machine. At last we came to the fork-roads, where a final decision must be taken—east or west. The doctor drew up. My lady panted, not with fatigue, but with eagerness. "Now which road are we to take?" said somebody. I indicated my intuitive feeling for west. The doctor, justly strong in faith in the canonical infallibility of Johnson, *Pontifex Automobilis*, showed an orthodox leaning to east. The canon, appealed to for an arbiter's award, naturally followed Gamaliel, and declined to decide, indicating that, in doubt, the safest course was to trust the driver. The driver, feeling the terrible responsibility in view of the fact that *pavé*—*pavé* of the worst—was ahead somewhere, and that if we got into it, good-bye to our steamer for a week, meditated a few moments in anxious silence. He

knew we trusted him, and probably was, for that reason, the more slow to cast the die. Fortunately, a native appeared on the scene, and so decidedly and cheerfully finger-posted us up the west of the fork that our steed no longer chafed at being kept standing still, but laid herself out *ventre a terre*, as our usually elegant French friends say, and we flew along merrily.

The cause of all the dubiety was soon apparent. The road on which we ran was excellent, but it was a narrow road, quite unsuitable and dangerous for racing purposes, and this was the cause why the Paris-Ostend route had been laid off in an easterly direction, which kept on a broader but not so good a highway. Only one other difficulty arose. When we came near Bergues Mr. Johnson's book directed that the tourist should keep to the right and go outside the ramparts. Again some doubt and uncertainty, for as we had found the best route for the last score of miles by deviating from the Johnson *vade mecum*, the question was, "Which way now?" Forming a firm opinion that there must be a road round the town, and that it would not be *pavé*, while we knew there was a long and bad *pavé* through it, I urged that we should go round. We did, and it proved to be right, although I confess that, on coming to the other side, I felt for a few minutes, as did the cavalier of old, who, insisting for his own route, led his party into a *quiel-opens*. At the side of a canal we came upon a stretch of road too bad for description. If every fifth stone had enjoyed a little earthquake to itself it could not have been worse. The sporting Marquis of Waterford trying to drive a four-in-hand over Giant's Causeway is the only parallel that suggests itself as sufficient. My heart sank. I expected my driver to turn a cold eye on me, and calmly—he is always calm—say, "You've done it now!" I was even afraid that the canon, when bumped beyond measure, might have his charity shaken out of him, and think a little evil. I felt certain he would not express it, and it made me sad to reflect that his feelings would get no relief. In such circumstances a bravado is best. I jumped off, walked with a bold firmness I did not feel to the door of a lock-keeper's cottage, and in steady accents asked a pleasant-looking girl, who opened it, if this was the proper road for Dunkirk. Oh, the joy of hearing that "Oui, Monsieur, tout droit"! Back and into the car with a triumphant bound and a strident "straight-on," and off we crawled, my firm belief being that the doctor and the canon, if they could have compared notes, would have pronounced me so ignorant of French that I must have misunderstood. On we floundered 200 yards, when suddenly the doctor cried, "Look at this," and, as if some good fairy had suddenly, with a wave of her wand, made every stone bigger than a matchbox sink out of sight, we were gaily careering along considerably over average S.E. suburban speed, with the spires of Dunkirk well in view, and daylight only beginning to fade. Despite a wrong turn on reaching the fortifications and a difficult turn back, requiring reverse gear, we rode into the town before eight o'clock. This was, I think, a splendid performance for a brand-new car. The distance run all told that day must have been nothing under 150 miles. The stoppages were numerous—at least eight, including *dejeuner*—not because anything was wrong, but because our prudent and skilled driver insisted on regular distance halts, and complete re-lubrication of all bearings, whether treated with oil or grease, and fresh supplies of cold water. It was time well spent, as we never had a seriously heated bearing during the whole 200 odd miles running.

We wandered about the docks of Dunkirk for fully three-quarters of an hour, being misdirected by the ignorant, who desired to appear knowing, and at last found the steamer, not a ship's-length from where we had passed her at the very beginning of our gyrations. Here we got a knock-down blow. The "Talisman" was lying outside another vessel, having been warped out to the dock gate, some busybody having told the captain that if we did not come by 6.30 we would not arrive that night. A mate with a seaman's gruff—though not meant to be gruff—tone told us we could not get on board now. Answer, "We must." Mate refers us to captain. Captain sent for. Captain Sutherland, kindly and willing if he can. At last

decision taken: ship's crane to put her on board as she is passing through dock entrance in the morning. I resolve to stay and see her safe on board. The doctor and the canon take farewell of me, and drive off to the station to go to Calais and catch the steamer.

I trust the doctor appreciates how I thank him for acting as first voyage pilot, and I hope the canon will have pleasant recollections of his first motor-car experience, and even find an apposite allusion or two for teaching illustration. He is precentor of his cathedral, and can testify to the happy harmonies of his first power-traction journey, and how sweetly the "Good Girl" hurried along. For that is her name, I said to my friends after her performance, and as I had so called her in my mind the name is hers as long as she holds together. The captain kindly gave me his bunk till three o'clock. Roused up in the grey of the morning, I found the "Good Girl" already in the slings beside the dock entrance, saw her carefully hoisted in, run under the hurricane deck and made fast. May all motorists find as careful a captain and auxiliaries! Then to bed in the house of Mr. Murray, the keeper of the Seamen's Institute, he and his kind wife doing all they could to make me comfortable. How the wind whistled through the chimneys! I thought of my two friends in the Dover packet, and felt no inclination to break the Tenth Commandment by coveting their berth.

On the third day after reaching Dunkirk Dr. Turner and I met at Leith. Found no serious damage done, although the stevedores, who would not allow the crew to put the car on shore, broke a mud-guard. *De minimis not curat autocaristicus*. Mrs. Turner joined us in Edinburgh, and we drove on, and arrived at Coll Earn, my summer quarters in Perthshire, safely—56½ miles, the "Good Girl" justifying her name up to the last as regards make and running powers. We did on the way from Edinburgh find the axis on which the exhaust levers lock to be cracked, and a local engineer found trouble in getting it out to replace it, as it was too hard in some parts. But this will not happen again, as we improved the form and tempering of the pin, so that, should it ever give way again, the removal will not be difficult.

If my "Good Girl" will only behave as well during the Glasgow week as she did on her first journey to an unknown land her guardian will be proud of her, and he will hope that others will admire her, for, like Rebekah of old, her person does not, he fondly thinks, belie the charms of her character.

THE Pall Mall Cycle and Motor Company, of 149, Ebury Street, London, S.W., have introduced a motor-bicycle on the lines of the Minerva. The firm inform us that they have introduced a number of improvements, and, believing that there is going to be a big demand for motor-bicycles, they intend to keep a full staff engaged on their manufacture during the winter months.

THE Board of Agriculture notify that the Ordnance Survey have completed the publication of the map of England and Wales on the scale of four miles to the inch. This is a general map of the country, and is likely to be useful to motorists and others who require a considerable area of country on one sheet. It shows all the principal roads, railways, rivers, towns, villages, large woods, and numerous altitudes. The map is published in twenty sheets, each measuring 22½ inches by 15 inches. Another edition of this map is being prepared, of counties or groups of counties, on thin paper.

ONE of the latest Midland cycle manufacturing firms to put a motor-bicycle on the market is the Quadrant Cycle Company, of Birmingham. The machine is known as the Quadrant Autocycle, and is driven by a small petrol motor carried below the bottom tube of the frame, the back wheel being driven by a band working on light pulleys. Both wheels are 28 inches in diameter. A powerful front rim brake is fitted, in addition to the Quadrant back-peddalling band brake, so that the control of the machine is absolute. The bicycle portion of the machine is specially built throughout, every part being made stronger as compared with the pedal-propelled bicycle to enable it to withstand the extra weight and speed.

THE BIG EVENT OF 1901.

THE GLASGOW RELIABILITY TRIALS.

ALL eyes in the motor world in this country are now centred on Glasgow, where the 500 miles trial of reliability, organised by the A.G.C.B.I., with the co-operation of the Scottish Automobile Club, commence on Monday next. We have already published the programme and objects of the trial (see issue of July 20th last), but we may mention briefly that the cars will take radial journeys daily from Glasgow, returning to the starting point each evening, and that systematic arrangements have been made for the realisation of the Automobile Club's main object, which is to establish the reliability of the motor-car of to-day. Each car will carry an official observer, who will be provided with minute instructions, and will be authorised, moreover, to restrain the driver, if need be, from indulgence in excessive speed, under pain of disqualification. A definite limit, in fact, has been assigned as the absolute maximum, and though it is not altogether a crawl, it will be far removed from racing. If the time-sheets show in any instance that this maximum has been exceeded, the competing car will be ineligible for a prize, no matter how good its perform-

(parts of motor-vehicles) there are five entries. Four of these were detailed last week, so that we have only to mention that the fifth entry is a set of New York tires, which are fitted to an M.M.C. voiturette. All the competing cars were to be in Glasgow on Friday, the 30th inst. To-day (Saturday) the Judges' Committee will hold special tests to ascertain whether the trial vehicles are fitted with sufficient brake power, and specially whether the brakes are so constructed that they will prevent the vehicle from running backwards if stopped on a steep up-gradient.

A Club dinner of the members of the Automobile Club of Great Britain and Ireland and of the Scottish Automobile Club and friends introduced by them is to be held in the Windsor Hotel, Glasgow, to-night (Saturday), at 7 p.m., at which it is hoped that all who are to take part in the competitions will make an effort to be present and avail themselves of the opportunity of mutual introduction. The Right Honourable Sir J. H. A. Macdonald, K.C.B., Lord Justice Clerk of Scotland and President of the Scottish Automobile Club, will occupy the chair; a number of the vice-presidents, most of the honorary members of the S.A.C., and others will be present.

Quite a number of new cars will make their *debut* at the trials next week. We have not been able to obtain particulars

THE LANCHESTER 10 H.P. TONNEAU CAR.

ance in other respects. Any stoppages that may be made by any of the cars will be duly recorded, and subsequently analysed by the judges. There will also be three hill-climbing trials.

The total distance to be covered is about 530 miles. On Monday, September 2, the journey will be from Glasgow to Mount Vernon, Bathgate, Edinburgh, Lanark, and Glasgow, 116 miles. The other days are apportioned as follows:—Tuesday—Glasgow, Greenock, Ayr, Kilmarnock, Glasgow, 107½ miles. Wednesday—Glasgow, Lennoxton, Stirling, Callander, Aberfoyle, Glasgow, 96½ miles. Thursday—Glasgow, Stirling, Dunblane, Greenloaning, Kirkintilloch, Glasgow, 95½ miles. Friday—Glasgow, Dumbarton, Whistlefield, Arrochar, Tarbet, Ardlui, Crianlarich, Tarbet, Alexandria, Glasgow, 115½ miles. The hill-climbing tests will take place at Lennoxton, Greenloaning, and Whistlefield. The first-named hill rises 950ft. in four miles, 750ft., however, occurring in the first two and a half miles. Whistlefield Hill is very steep, rising over 300ft. inside a mile.

A full list of the forty-one cars in the manufacturers' section, and the eleven vehicles in the members' privately-owned section, entered for the trials, was given in our last issue. In Section 3

of all of these in time for the present issue, but append a description of several herewith:—

The illustration given above shows the 10 h.p. car entered by the Lanchester Engine Company of Birmingham. The engine, of this firm's well-known balanced type, gives an absolute freedom from vibration. It is of 10 h.p., and is air cooled by forced ventilation, no water being required. The governing of the motor speed is automatic, and is capable of instant control from the driver's seat, giving at will a varying motor speed of from 400 to 1,000 revolutions per minute. The ignition is effected by an electric current, generated by a magneto alternator of special design, dispensing with the need of batteries or accumulators. The sparking plugs are arranged to be instantaneously detachable, and can be removed, examined, and replaced in a few seconds. No wire connections are employed, the electric current being conveyed to the ignitors by a brass bar completely insulated at its point of support, so that all possibility of short currents and failure is avoided. The car is fitted with three change-speed gears, giving a liberal choice of speeds. No chains are used on the car, which has a worm

drive; this the company state they have found, after long tests, to be the most perfect and efficient method of transmission. Two powerful brakes are fitted; the gears and brake are actuated by two levers, which, when forward, drive ahead, and backward apply the brakes. The brake actuated by the low gear lever acts as a reversing gear if the application is continued after the car has come to rest. Tiller steering is fitted, the Lanchester Company believing that this method when once tried will be preferred to the wheel form of steering, which, however, they are prepared to fit if required. The petrol tank, which is provided with indicator gauge, has a capacity of ten gallons, permitting a run of over 250 miles without re-filling. Automatic lubrication is fitted throughout, there being a central tank of sufficient capacity for a 300-mile run. The oil is distributed to all parts of the motor by a system of tubes, and the supply automatically ceases when the engine is stopped. The car, which is fitted with a body of the popular *tonneau* type, has an extended wheel base and wide gauge, securing safety and comfort in running. The method of suspension is also a new departure by which, it is claimed, the speed may be maintained with perfect ease over the roughest roads.

It has been known for some time that the Enfield Cycle Company, Ltd., of Redditch, were at work on a new type of motor-car. We are now able to give an illustration of the "Royal Enfield" vehicle, which will be ready for delivery for the new year. The engine is of the two-cylinder type, water-cooled, and is built on the well-known "Ader" system, a description of which was given in our issue of May 11th last. The water

THE ROYAL ENFIELD CAR.

circulation is maintained by means of a pump driven by friction off the clutch face. There are three speeds and reverse, the change wheels sliding on a square shaft on the well-known *balladeur* system. Power is then conveyed to a differential gear shaft having at its extremities the usual chain pinions. To take up all shock in starting, the engine is fitted with a special spring drive, which is rather difficult to explain without illustrations, but we understand it is effective in reducing all shock. A very important detail in connection with the engine is a patent arrangement for throttling the gas supply at the moment the clutch is thrown out, to prevent the engine racing. This greatly facilitates changing the speed, and does not require any manipulation of the gas or ignition levers to effect changes quickly. It acts practically in the same way as a governor. The carburettor is also made under "Ader" patents. It is entirely automatic in its action, and is kept at a constant level. By this means it soaks a series of wicks held in brass cages through which the air is drawn. The air becomes saturated with vapour, and is passed to the engine by means of a mixing valve. The body of the car is a *tonneau*, but of course any pattern, such as the double phaeton or the spider car, can be fitted. Underneath the back seats are special compartments for tools, etc. The front seat contains the petrol reservoir, induction coil, and accumulators and there is also room for spare air tubes, etc. A special feature in the steering is the manner of fixing the front axle to the framework. The usual side springs in front are dispensed with, one spring only being fitted across. This spring

is fitted to the frame in the centre of the front cross bar, and attached to the axle are four tie rods, two on each side, which pass back and fasten on another swivel joint midway in the frame. The action of the front axle when passing over a rough road is to rise and fall entirely independent of the frame, which remains horizontal. The road wheels are fitted with artillery hubs and wooden spokes, and can also be fitted with tangent wire spokes and bicycle hubs if desired. The rear wheels are 36 in. and the front 28 in. in diameter. The front bonnet is entirely detachable. The lubrication of the change-speed, bearings, pump-bearings, differential gear, etc., is by means of grease lubricators fitted to the dashboard. Sight-feed oil-lubricators are also fitted to the dashboard, to lubricate the engine.

The Daimler Motor-Car Company, Limited, have three cars entered for the trials—two of the new pattern light cars and one 18 h.p. four-cylinder *tonneau*. The new Daimler light car is fitted with an improved *tonneau* body, constructed to carry four persons, including the driver. The engine is a standard 7 h.p. Daimler, fitted with both tube and electric ignition. The gear box is constructed almost entirely of aluminium, and is provided with three speeds and a reverse, giving eight, sixteen, and twenty-five miles an hour at a motor speed of 720 revolutions per minute, and eight miles per hour on the reverse. The gear wheels of the two lower speeds are made of steel and manganese bronze; those of the top speed being of steel. The gear wheels are extremely wide for a light car, and it is estimated that they will stand upwards of 20,000 miles of wear before it is necessary to have them renewed. From the gear box the power is transmitted through a longitudinal shaft, on the tail end of which is a bevel pinion gearing on a bevel wheel on the rear live axle. The usual form of differential gear is contained in an aluminium casing. On the forward end of the longitudinal shaft is a combined universal joint and brake-drum of special construction. The usual sprocket brakes are also fitted. The clutch between the engine and the variable speed gear is a single one of large diameter, and is constructed to avoid putting too sudden a strain on the shafts and gears, and yet will, it is claimed, never slip, except when required. The whole of the controlling, accelerator, and advance sparking levers are conveniently arranged under the steering wheel, within easy reach of the driver's hand. The water tank and coolers are arranged just in front of the motor and partly within the bonnet. The road wheels are of equal size, 32 in. in diameter, and are fitted with 90 mm. (3½ in.) pneumatic tires. Weldless steel tube of ample strength has been exclusively used in the construction of the frame. The weight of the car complete is 10½ cwt.

The car entered by Messrs. J. Parr and Co., Ltd., of Leicester, is driven by a 5 h.p. engine, and has accommodation for four passengers. The speed can be varied at will up to twenty-four miles per hour, a reverse motion being also fitted. When required to carry two passengers only the back seat may be detached and replaced with luggage carrier, or by removing four bolts the whole body can be removed and replaced with a light delivery van for business purposes. Two sets of powerful brakes are fitted, one set of band brakes operating on drums on the driving wheels by a foot lever, and the other, a powerful emergency brake, operating by a hand lever on a drum on the balance gear. The brakes can be applied when the car is moving either backwards or forwards.

In addition to their 5 h.p. and 10 h.p. vehicles, the Wolseley Tool and Motor-Car Company, Ltd., will have a 20 h.p. car in Glasgow during the trials.

The Progress Motor Co., Ltd., find it impossible to get their new car—which will be their 1902 pattern with motor in front—ready in time to take part in the trials. We shall give a full description with illustrations of the new vehicle in a few weeks.

LORD IVEAGH has just received delivery of a Serpollet steam car. It is the first of its kind in Ireland.

J. C. MEREDITH, Limited, Summer Lane, Birmingham, stock all parts, such as tremblers, contact screws, etc., in connection with De Dion, Ariel, Aster, Decauville, Darracq, Minerva, Werner, and Motosaeoche motors.

CONTINENTAL NOTES.

By "AUTOMAN."

IN an interview with M. Georges Prade, of the *Auto-Velo*, M. Henry Fournier speaks of the car in which Captain Laycock met with his serious accident the other week. It is the 20 h.p. Mors, which belonged to Count Cahen d'Anvers, and in which he met his death. Fournier, then quite unknown to fame, was also in the car at the time with the unfortunate Count, and had a very narrow escape. Fournier left Southampton last week by the "Deutschland," bound for New York. Having driven the fastest automobile, he naturally chooses the fastest Atlantic liner. He has taken out with him to America a 40 h.p. Mors car, similar to the one on which the Paris-Bordeaux and Paris-Berlin races were won, and which was presented to him by the brothers Mors on the occasion of his victorious entry into Berlin. Tod Sloan is going with Fournier, and has become the owner of the Mors car piloted by M. Brasier in the Paris-Berlin race, and which arrived fourth. The Buffalo-Erie race seems to be one of the objects of Fournier's trip, but he also gives it to be understood that several propositions have already been made to him to start an agency in motor-cars in New York.

THE SANTOS-DUMONT MOTOR-BALLOON IN COURSE OF PREPARATION.

In a letter to a contemporary, Mr. Sidney H. Hollands, of Coventry, comments on M. Santos-Dumont's accident and providential escape, and brings up the old controversy of heavier than the air or lighter than the air, or, as he aptly puts it, gravity versus levity, on which subject the Duke of Argyll, a great authority on aeronautical subjects, held and propounded the doctrine that nothing but gravity or heavier than the air could possibly succeed in the way of flying machines. Mr. Hollands goes on to speak of the use of gravity in the soaring of birds, and ends up by wishing to hear of M. Santos-Dumont's conversion to the gravity theory. In an interview I had with him just before he met with his last accident M. Santos-Dumont explained to me his ideas on this controversial question, and told me that he first began with lighter than the air, and was soon converted to heavier than the air, which is the opinion he still holds, backed up now by a larger practical experience of mechanical flight than any living man. Contrary to the statements to be seen almost every day in the Press, the Santos-Dumont No. 5 was heavier than the air, and was raised from the ground by purely mechanical means. Before the engine was put in motion it rested on the ground, and if the engine was stopped when in the air it sank towards the earth in a

vertical direction. It was, therefore, heavier than the air. The balloon is only used to reduce the weight of the whole and thus make the conditions more birdlike, for it would be impossible for human ingenuity to construct a machine whose power would have the same comparison to its weight as is the case with a bird. But M. Santos-Dumont goes further and claims that the shape of his balloon makes it act as an aeroplane. Owing to the horizontally elongated form of the envelope it is easier for it to go through the air horizontally than vertically, therefore it has a tendency to float. With regard to the flight of birds, M. Santos-Dumont does not hold the opinion generally expounded, that is that the birds are aided in their flight by the wind, and is convinced that birds do not tack like ships. He rather leans to the view that the bird chooses for itself the currents of air that suit the general direction of its flight. That the wind is a series of puffs and eddies, and not a solid body of air moving along, is a well-established fact, and it is also a fact that a bird's visual power is far greater than a man's, and who can tell, says M. Santos-Dumont, whether or not the bird's eye is constructed in such a manner that it can actually see the air moving and choose the eddies favourable to its direction. Then, again, it is an undoubted fact that the wind is in fan-shaped stratas, so that if twenty small balloons are sent up together from the same spot they will take twenty different directions

M. SANTOS-DUMONT (THE CENTRAL FIGURE OF THE GROUP) AT THE AERO-CLUB AT SURESNES.

according to the altitude they reach. A bird may therefore sustain itself in the air just above the strata of the wind which is near to the earth, and in a strata which is more favourable to its flight, and thus it may seem to us to be flying dead against the wind when in reality it is only flying across the wind. There is also another point that is not generally understood with regard to M. Santos-Dumont's system, which is, I believe, quite novel and unique, that is the fact that to ascend or descend he does not throw out ballast or let out gas, but by means of a balance weight he simply points or inclines his machine (balloon, keel and all) upwards or downwards, and the propeller does the rest. His system has frequently been compared to Count Zeppelin's, but there is no similarity between the two—as the latter experimenter throws out ballast to rise, and is therefore lighter than the air.

MR. GRIFFITHS, in an article on this subject in a daily paper, comments in a similar manner to Mr. Hollands on M. Santos-Dumont's system, and wishes also to see the young Brazilian change his plan. Mr. Griffiths, however, finishes up his article by saying that M. Santos-Dumont's system will never succeed until a tallow candle can be pushed through a deal board, over-

looking the fact that to perform this interesting experiment you need only fire the candle from the barrel of a gun, and it will easily traverse a deal board.

M. HENRY DEUTSCH, as I have already mentioned to the readers of the *Journal*, was constructing a flying machine on the same system as M. Santos-Dumont, but much larger. Owing, however, to the criticism of the *New York Herald* on M. Deutsch competing for his own prize, the latter gentleman decided to stop the construction of his machine and gave orders accordingly. Fortunately, however, M. Victor Tatin and the Committee of the Aero Club have induced M. Deutsch to modify his decision, and to hand over the construction and trial of his air-ship to M. Tatin, who will complete it, assisted financially by M. Deutsch, and who will enter it for the Deutsch prize.

M. MAURICE FARMAN, the well-known French *chauffeur*, is the latest to take to aeronautics, and went up last Sunday in a balloon cubing 800 meters.

AN International Automobile Club is about to be formed in Paris, with the object of constructing an immense motodrome for automobile races. Prince Drucki Lubecki, the Counts of Kermel and Briey are amongst the names of the Committee, and the club premises are to be somewhere near the Champs Elysées. It is intended that the A.C.I. shall be the meeting ground for all the affiliated clubs.

THERE are about fifty entries for the motor races at Deauville, which take place to-morrow (Sunday). The competing cars must start from the Châlet des Cycle at the Porte de Suresnes, in the Bois de Boulogne, Paris, between 9 a.m. and noon to-day (Saturday), and must reach the garage at Trouville between 6 a.m. and 10 p.m. this evening. Amongst the entries are Girardot, Lemaitre, Serpollet, Osmont, Teste, Demester, Cormier, and Rivière. Mr. S. F. Edge has entered a 50 h.p. and a 16 h.p. Napier, and Jenatzy has entered a car in which he hopes to do the kilometre in less than 30 seconds. By special permission, Mr. Edge will be controlled at Boulogne, and will run direct to Trouville instead of going to Paris and thence to Trouville.

QUITE a number of Scotch firms inform us that they have made special arrangements to cater for the wants of motorists during the coming trial week. Messrs. Calder and Armour, 14, Broomielaw, Glasgow, after consultation with the Scottish Automobile Club and the Secretary of the Automobile Club (London), have arranged to supply at the tramway stables—in which the competing vehicles will be stored—Carless, Capel and Leonard's petrol, and Pratt's motor spirit. Carts will deliver the spirit at the tramway stables on Saturday, August 31st, from 8 to 10 a.m.; on Monday, Tuesday, Wednesday, Thursday, and Friday next week from 6.30 to 8 a.m.; and Saturday, September 7th, from 8 to 10 a.m. Messrs. Calder and Armour also hold a stock of Price's motor-car lubricants. Messrs. Rennie and Prosser, Limited, 93 and 95, Mitchell Street, Glasgow, agents for De Dion-Bouton and Panhard and Levassor, are prepared to deliver petrol, oils, grease, etc., at the garage where the cars will be stored by six o'clock each morning. The firm is also in a position to supply all sizes of Clipper-Michelin tires at the shortest notice. Mr. W. H. Kingsbury, 61, Bath Street, Glasgow, will also have a large stock of spare parts on hand for different types of cars, as also D oil and other lubricants and greases. Messrs. Peter Lee and Sons, of 34, Trongate, Glasgow, will supply motor spirit, cylinder oil, axle, bearing, and other grease, etc., they having arranged for their carts to deliver the same every morning between 6.30 and 8 a.m. during the trials. Finally, the Kingsburgh Motor Construction Company, Limited, Granton, Edinburgh, write asking us to mention that they are prepared to supply petrol and to do any repairs during the trials. A stock of parts for Daimler cars is kept on hand.

CORRESPONDENCE.

A SUGGESTED CLUB FOR MOTOR-BICYCLISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. T. Underwood suggests in your issue of August 17th the formation of a club for motor-cyclists. This suggestion has been already anticipated by the formation of the Automobile Sporting Club, with headquarters at Burgos House, Sydenham Road, North Croydon, which will be opened on September 1st for the convenience of automobilists, cyclists, and lovers of sport in general. Those gentlemen who specially favour the motor-cycle will here be able to arrange runs either among themselves or in conjunction with riders of motor-cars or cyclists, and will have all the advantages of a well-appointed social club.—Yours truly,
R. J. CHOLMELEY, Secretary.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see among correspondence a proposal to form a motor-cycling club. I for one shall be pleased to join if the subscription does not exceed a guinea; it is the one thing that I have often thought should be formed, and I am sure many cyclists would buy motors if they thought there were chances of club runs, for of all things a cyclist hates most is riding by oneself. Many a time have I gone to seaside resorts on my Werner by myself for the reason that my machine is too fast for the ordinary bicycle. Trusting the proposal will receive many supporters.—Yours truly,
HENRY KENNETT.

ELECTRICAL IGNITION MATTERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one to whom the advantages of a personal visit to the recent Automobile Exhibition have been denied, allow me to thank you for your excellent show numbers, which to me have been second only to an actual visit.

I should like to say a few words on the much-discussed subject of electrical ignition. Speaking as an electrician I must say that it is a marvel, not that electrical ignition gives trouble, but that it works at all, by reason of the electrical abortions perpetrated at the hands of some "motor" engineers. The novice is in many cases instructed to short circuit his battery, either primary or secondary, as the case may be, through an "ampere-meter," which electricians have known as an ammeter from time immemorial. Then, again, many of the contact breakers—I beg pardon, "tremblers"—some of which do not tremble, are most unsatisfactory. Why a "wiping" contact is not used on the half-speed gear more often than the "touch and go" affair, with its flimsy and costly platinum contacts, is a mystery. The slight spark at "break" occasions no trouble, as the rubbing action of the contacts cleans off any oxidation, which, in the case of the "touching" contact, would be serious were it not for the platinum. A case in point is the switch used in lighting circuits. A very heavy spark is produced at "break," burning the contacts considerably. This, however, is provided for by the construction of the switch, which automatically cleans the contacts by the rubbing action it exerts when being turned "on" or "off." It is scarcely necessary to observe that the primary spark in connection with electrical ignition is infinitesimal compared with that encountered in dealing with heavy currents at a very much greater voltage.

While on the subject may I draw Mr. A. J. Wilson's attention to a slight error which has crept into the last edition of his admirable work on motor-cycles? He says, on page 41, line 42, *et seq.*:—"The route is from one end of the battery to the handle-bar, along inside the left half of the handle-bar to the switch on its end, back and along the frame to the automatic contact-breaker, thence to the induction coil . . . and back along the frame to the battery. In other words, both poles of the battery are to be "earthed" to the frame, which, on completion of the circuit by the switch, would result in a "dead short." Should this meet his eye, I trust he will pardon me for offering a friendly correction. A useful tip to protect terminals from wet, and much neater and handier than rubber tape, is to encase the wires throughout their length with rubber tube.

This is turned back at each end while the necessary contact is effected and then slipped over the entire terminal, not only keeping the wet out but raising the insulation of the entire wire.

I may say I am experimenting with an improved coil, but, as the present letter has run to too great a length, will hope to say a little more at a later date.—Yours faithfully,

Port Elizabeth, South Africa.

ROOINEK.

P.S.—Just as I have written this a belated mail, detained by “military operations,” brings me my copy of the *Journal*. May I say how heartily I concur with the Rt. Hon. Sir J. H. A. Macdonald? Surely the time is past when we depended on the Continent for the smallest bolt and nut. *Garages, chauffeurs, etc.*, are to the British mind monstrosities, and why must the good old word “fitter” or “mechanic” be replaced by *mécanicien*? Does this latter distinguish the finker or “motor” engineer from the genuine article? Let us by all means use good British material and dignify it by good wholesome Anglo-Saxon.

AERIAL NAVIGATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—No one can deny the interest displayed by everyone in the problem of aerial flight as being worked out by our neighbours the French, but has it not struck some of us that English capitalists, with their vast wealth, or even the Government itself, never offer a prize for anything? A good prize, such as the Deutsch prize, would stimulate inventors to reach many a desired end. Everyone will admit that it is through the energy of the French that the motor-car is with us, and further that it must benefit the human race. We are imitating the French every day in motor-car building, and soon we shall be pirating from the same nation ideas in aerial navigation, not because we have no inventors, but because our inventors are poor. Now, Sir, I have struck the nail right on the head. Who ever heard of a real inventor rich at the start? I might almost ask who ever heard of an inventor rich at all? As a class they are poor, and to patent an invention under such circumstances is the height of folly, for the patentee, as everyone knows, or ought to know, gets no protection from the Government. How, then, is he to fight a wealthy company, or how is he to fight anybody, for that matter? Let me quote an experience of my own as an inventor. My first invention consisted of an air ship, without any balloon attached, and I guaranteed it (under an indemnity) to rise direct in a vertical line, also to travel when at any reasonable altitude in any direction at will, and to return to the same place and come to rest in the same position as before starting. I approached all I could think of, whom I considered might, by reason of their wealth, finance me in the undertaking, and I failed. When I found, as was invariably the case, that the full working drawings were to be sent by post, not taken by hand, I dropped my invention, but had I had the slightest encouragement I have no reason to doubt that aerial navigation would have been achieved ten years ago.

My second invention was a safety appliance for railway working, and consists of an apparatus (quite inexpensive in itself) that will make collisions absolutely impossible, no matter what the conditions, even should the driver disregard the signals, or a train run away. I approached a wealthy railway company, was willing to agree to an indemnity as before, but here a complete specification of a patent was required, which amounted to the same publicity as in my former experience. Where, I ask, is the inventor's protection? If we must imitate the French, or any other nation, we might have the chivalry to admit it, though the confession does not say much for our boasted engineering skill. Instead of our being called a nation of shopkeepers I think it would be more appropriate if we were called a nation of imitators.—Yours truly,

H. W. WALTER.

A CORRESPONDENT writes:—“Can any of your readers give me experience of working of the Twin tire, how it wears, and whether it skids in mud?”

REGARDING the proposed club for motor-bicyclists, Mr. C. Stanley Sadgrove, of 149, Ebury Street, S.W., writes that he would willingly become a member of the club should it be formed. Further, he is in a position to introduce other members.

AN ENGLISH MOTOR-BALLOON.

SO much attention is just now being centred on the question of motor-balloons that no excuse is needed for publishing some particulars of the work of an English experimenter—Mr. Frederick Buchanan, of Cosham, Hants—whose invention partakes of the nature of an air-ship, or mechanical bird, rather than a balloon. Mr. Buchanan's machine is heavier than air, but he has adopted the principle of the balloon as an assistance in preventing it being too heavy. The machine is as nearly as possible bird-shape, and has an ornamental bird's head affixed to the bow to assist the illusion, which is at the same time shaped to throw off or reduce the air resistance. The balloon part inflated is the portion above an imaginary horizontal line drawn through the centre. The actual air ship is in the portion below the line. Mr. Buchanan regards the balloon part, however, merely as a protection, and for no other purpose than to assist buoyancy in the same way as a life-belt is now used by a swimmer. The lower part, that is, the actual air ship, contains the car and machinery, in a framework of bamboo and canework, with portholes admitting air fore and aft. This framework—the whole ship, in fact—is surrounded by a covering of waterproof sail cloth, which by its curved shape reduces the air resistance which the open ship would inevitably meet. The air ship, which is all but ready for a trial trip, lies in a shed at the rear of Mr. Buchanan's residence. She is 120ft. long, with 12ft. to 14ft. beam, and will weigh, when the balloon is attached and everything on board, about 23 cwt. The present petrol engines in the ship are of from five to six

DIAGRAM OF BUCHANAN'S NEW AIR-SHIP.

horse-power, with two cylinders; but these have not given satisfaction, and consequently a new set is in course of construction by Messrs. Spencer Bros., of Highbury, to Mr. Buchanan's designs. They will be of from twelve to fourteen horse-power, with four cylinders, and will, it is expected, drive the ship at between thirty and forty miles an hour. The ship is steered by a powerful rudder, which works from every angle—up, down, or sideways—at the will of the engineer. It is driven through the air by two powerful propellers, one on each side of the vessel, and constructed on an ingenious plan, enabling them to give an ascending, descending, or steering power. They are, in fact, the wings of the bird, and act in conjunction with the tail rudder. The blades of the propellers are grooved on their surface transversely, the effect of which, the inventor claims, is to give them exceptional power of gripping the air. Mr. Buchanan is an elderly man, who has spent twenty years of his life and expended nearly £10,000 upon the working out of his scheme. He holds that this bird-like vessel dives head downwards and rises head upwards, and sails through the air with the action of a bird, and at greater speed than ever previously achieved. As far back as 1884 Mr. Buchanan submitted a model of his invention to the military authorities at the Royal Engineering School at Chatham, and Colonel Gordon, R.E., a brother of General Gordon of Khartoum fame, reported on behalf of a committee of inspection that they considered the machine would accomplish all that was claimed for it. But the War Office will not help in the development of private inventions, and for want of capital Mr. Buchanan has up till now been unable to perfect his ideas. Meanwhile, the Deutsch prize is still to be won, and Mr. Buchanan is full of confidence. His countrymen will wish him luck in his enterprise.

THE DUPONT TWO-SPEED GEAR FOR MOTOR CYCLES.

FOR some time past there has been a general tendency to fit motor-tricycles and quadricycles with a clutch; later still attention has been devoted to the question of equipping such machines, particularly quads, with a two-speed gear. Several devices of the kind have from time to time been introduced, and we are able to illustrate and describe that known as the Dupont. This gear consists of a main shaft, J (Figs. 1 and 2), upon which is mounted freely the main gear pinion I. This shaft and pinion replace those ordinarily in use. The change-speed consists of the case G, containing the bevel pinions K, K¹, K², and K³ (Fig. 2), which are mounted as follows—K and K² free upon the cross axis LL (Fig. 2), which in turn is held in the blocks PP, while K¹ is firmly keyed to the motor shaft J and K³, which is fitted with a long bearing, revolves freely upon the shaft J, but is keyed to the female clutch A by the key or feather N. A continuation of the gear box G forms the male portion of the clutch B, and the pinion I is also secured to G. The portions A and B are kept engaged by means of the spring E mounted concentrically upon the motor shaft J, whilst the clutch A can be kept stationary,

when not engaged with B, by means of a band brake (not shown in illustrations). In proceeding to fit the gear it is necessary to disconnect the engine from the frame, take the flywheels apart, leaving the cross-head pin attached to the flywheel on the pinion side, and, having removed the existing pinion shaft from the flywheel, see that the coned end of the shaft J and the key fit perfectly in the female cone of the flywheel. Having ascertained this, proceed by placing the correct half of the crank case over the end of J, after which replace the flywheel. Tighten up and replace the nut locking-plate, and swing the whole between the centres of a lathe to see that the flywheel is true with the shaft J. After seeing that this is correct, replace the engine connecting-rod and second flywheel on the crank-pin,

tighten up the nut, and replace the whole in the lathe and true up the flywheel just replaced with the flywheel already fixed to the shaft J. When both flywheels revolve truly finally tighten up and replace nut locking-plate. The two halves of the crank case should now be rebolted together, seeing that the crank-shaft has a slight amount of end play (about one sixty-fourth of an inch). Remount cylinder and combustion head and refix engine to frame, now see that the new pinion meshes correctly with the large gear wheel and that the shaft J is parallel with the driving-wheel axle. At the outer end of shaft J will be found two small recesses, the outer of which locates the position of the ball-bearing sleeve, whilst the inner recess indicates the position of set screw of collar F (Fig. 2). Having adjusted up the ball bearing in the correct position on the shaft, place the clip with the swinging

arm over the axle casing, and bringing the arm into position with the ball bearing casing, mark off the holes in the former and drill for size of bolts and secure in position. When fixed see that the shaft revolves freely.

It will now be necessary to fix the clip, to which is attached one end of the fork by means of the female portion of the clutch A is disengaged from the male portion B on to the axle casing. Place the runners on the pins in the fork, and, holding them centrally in the recessed portion M, mark off the hole in the other end of the fork arm from that already drilled in

the clip, for the bolt which will form the fulcrum upon which the fork arm will swing. The side of the fork arm upon which the incline is formed is to be nearest the gear case G. Having fixed the arm in position, slide the clip along the axle casing until the lever, which swings on the pin formed on the clip, and to which one end of the band brake is attached, is clear of the straight portion of the fork arm at the bottom of the incline by one-sixteenth of an inch to allow the spring F to press the clutch A well home, and tighten the clip in this position. If the lever is now swung so as to ride up the incline it will be found that the female portion of the clutch is withdrawn from the male portion, and the spring E at the same time compressed, and in this position the free motor is obtained. To allow of the lever riding up the

FIG. 1.—GENERAL VIEW OF GEAR.

FIG. 2.—SECTIONAL VIEW OF GEAR.

A, female cone of clutch.
B, male cone of clutch.
C, fabric clutch grip.
D, clutch thrust ball bearing.
E, clutch spring.
F, clutch spring stop.
G, clutch box enclosing gear.

H, disc plate screwed to G, and cut to fit into teeth of motor pinion I.

I, motor pinion loose on motor-shaft J.
J, motor shaft.
K, bevel pinion keyed on motor-shaft J.
K¹, K², bevel pinions carried by clutch-box G on trunnion spindle L L.
K³, bevel pinion fast on clutchshaft J, by feather N.

L L, trunnion spindle carrying bevel pinions K K².
M, clutch collar for striking arm.
N, feather making bevel wheel K³ fast to female portion clutch A.
O, disc closing open end of clutch box G.
P, carriers carrying trunnion spindle L L.

incline easily it is advisable to round off the edges engaging, so as to obtain a smooth action.

The operating handle may now be fixed, in any convenient position, to the top tube of the machine, and the rod to connect it to the top end of the lever on the clip made to the correct length. To obtain this length place the pin in the handle in the forward recess (*i.e.*, nearest the handle bars, and which will afterwards be the position for the top speed), and with the bottom end of the lever on the clip just at the bottom of the incline on the fork arm and clear of it; bend the ends of the rod to fit in the holes in the ends of the handle and clip levers. It may be found necessary to crank or set this rod to clear the rider's leg owing to the operating handle and the lever on the clip not being in line. When this rod is fixed in position on the operating handle, being placed in the mid or upright position, the end of the lever on the clip should have reached the straight portion at the top of the incline on the fork arm, and should be resting on it for about one-eighth of an inch, and the female portion of the clutch A should be clear of the male portion B, whilst the band brake should be quite clear of A to allow of its revolving freely. On the operating handle being locked in the back recess the band brake should grip A fairly tightly, and if this is not the case it must be adjusted to do so. The gear should now be ready for testing. See that all the bearings are lubricated and the gear box G filled with grease by means of the small screw shown in Fig. 1. Jack up the driving wheels and start the motor by means of the strap and pulley provided, keeping the operating handle in the upright position. In this position the motor shaft J, driven by the engine, rotates the bevel pinion K1, which in turn rotates the pinions K and K2, and these cause K3 to rotate in the opposite direction, carrying the female portion of the clutch A with it. But as A is not engaged with B no motion is transmitted to the pinion I. Owing to the centrifugal force set up in G, and the slight amount of friction due to J and A travelling in opposite directions, there is a tendency for the shaft J to carry the whole gear box G round with it, and this may be sufficient to transmit some motion to the road wheels even on the level road unless the brake is applied. In placing the handle in the forward position (*i.e.*, the top speed) the female portion of the clutch A is allowed to engage with the male portion B, thus preventing A from rotating in the opposite direction to J, and the whole gear is rotated in the same direction as J, and at the same speed. On placing the handle in the back position (*i.e.*, the low speed) the two portions of the clutch are again disengaged and the band brake caused to grip the portion A, thus preventing it from rotating. The motion of the engine shaft is then transmitted through the pinion K1 to the pinions K and K2, but owing to K3 being held fast by the band brake on A the motion is transmitted through the cross axis LL to the gear box G, carrying the pinion I with it, but at half the speed of the shaft J. When thus properly fitted the gear runs beautifully, the speeds being changed by a slight movement of the lever without the slightest shock or jar to machine or rider. With the Bowden wire fitted to change the speeds the action is even more delightful. The sole agency for the Dupont gear is held by the United Motor Industries, Limited, 40, Holborn Viaduct, who have already supplied a considerable number of them.

THE motor-cars supplied to the Austrian army are destined to perform more duties than that of transport. By a simple belt arrangement the motor drives a dynamo which generates electricity for various purposes.

ACCORDING to the *Irish Cyclist*, probably the first automobile in Ireland was Hancock's "Era," afterwards named "Erin." It arrived in Dublin on the 6th January, 1835, having left London on board the ss. "Thames" on the 30th December. It only ran for eight days, "sufficient to effect the purpose of its visit;" though what this was is not stated. It was reshipped to Stratford. Before being taken over to Ireland it had carried some 4,000 passengers between the City and Paddington, and later on ran to Marlborough and back.

HERE AND THERE.

It is reported that the King of the Belgians is establishing a private motor garage at Ostend.

A SCHOOL for teaching the handling of automobiles has been established in Berlin. The fee is £2 10s. for ten lessons, which are supposed to be sufficient to insure competence.

MESSRS. ALLEN BROTHERS, of 496, Kingsland Road, N.E., supply Pratt's motor-spirit, lubricating oils, greases, and accessories for motor-cars and motor-cycles. Repairs are also undertaken at the same establishment.

As Mr. W. Goodchild and Mr. C. Poston, of Romford, were riding in a motor-car one day last week a dog was caught in the steering gear, and the car overturned. Mr. Goodchild was severely cut about the head and face.

WE learn that Mr. Dan Albone, of Biggleswade, is building motor-bicycles for Lord Alwyne Compton, M.P., the Right Hon. Graham Murray, M.P. (Lord Advocate for Scotland), Mr. George Kemp, M.P., and several other well-known gentlemen.

THE Birmingham Motor Manufacturing and Supply Company, Limited, have taken some fine showrooms at Broad Street, near to Five Ways, Birmingham, and will shortly have on view their latest direct-driven car, particulars of which we hope to publish later.

THE sole agency in Great Britain for the "Kelecom" petrol motors made by Messrs. Antoine and Co., of Liege, has been secured by the Motor Fittings and Engineering Co., of North Road, Brighton. The engines are made in various sizes from 2½ h.p. to 10½ h.p.

AT Tiddington, on the evening of Sunday, the 18th inst., a motor-car belonging to Mr. C. T. Crowden, of Leamington, collided with a Stratford cyclist on the road between Stratford and Tiddington. The cyclist was severely cut and bruised, and his machine much damaged.

WE regret to announce the death at Perth, on Wednesday, the 21st inst., of Mr. Rowland John Murray. For some time deceased, who was only twenty-six years of age, was connected with the Caledonian Cycle and Motor-car Company at Aberdeen, but relinquished his position on being appointed to the Scottish Motor Company in Edinburgh, of which he was a director at the time of his death.

AT a recent sitting of the Ripon City Bench, the mayor called the attention of Inspector Booth to the reckless manner in which some cabdrivers drove their vehicles, and asked that they be cautioned. Mr. Whitham (clerk) suggested motor-cars as well. The mayor said motor-cars should be included. Members of the Bench complained of the speed at which motor-cars were driven through the streets.

DURING the recent manœuvres Mr. Archibald Weir, of Ottery St. Mary, placed his De Dion double phaeton car at the disposal of the military authorities, which proved exceedingly satisfactory. Mr. Weir, in referring to the subject, writes, "I hear that in the Aldershot manœuvres the general and staff concluded that my phaeton was the car best fitted for the work. It did particularly well across country, and never failed to start in an instant."

AN unfortunate accident recently befell Mrs. Shaw, the wife of Mr. T. F. Shaw, the borough member for Stafford. Whilst driving to Stafford Station her horse took fright at a motor-car which was driven by the Earl of Shrewsbury, who was proceeding to Ingestre Hall. The animal bolted along at a rapid pace despite every effort on the part of the coachman to rein it in. Mrs. Shaw and the coachman were thrown from the trap, the former being badly shaken and sustaining slight concussion of the brain. We are glad to learn that Mrs. Shaw is now out of danger and is making good progress towards recovery.

A NEW motor-bicycle is about to be put on the market by the Progress Cycle Company, Limited, of Coventry.

COMPLAINTS have reached us from Ormskirk that one evening last week a gentleman drove his motor-car at top speed through the town and past the church into Southport Road, to the danger of the lives of many cyclists.

CALLING at the works of the Century Engineering Company, Ltd., of Cumberland Park, Willesden, a few days ago, we found them very busy. They are now turning out three of the Century tandems per week; one was just being despatched to a customer at Durban at the time of our visit.

THE annual sports in aid of the Poplar Hospital, organised by the Danes Cycling Club, were held at the Memorial Recreation Grounds, Canning Town, E., on Thursday afternoon. Included in the event was a motor pursuit race, while Mr. T. Maltby, junior, gave an exhibition ride on his De Dion spider.

MR. JAMES PAINE writes to the *Bridgwater Mercury* to warn drivers of motor-cars that the law does not allow them to exceed a pace of more than twelve miles an hour, and that they "may rest assured that I shall do my best to see that the law is enforced." Evidently some painful experiences are in store for motorists going Bridgwater way, but as to what they are likely to be we do not know.

MOFFATT AND EASTMEAD, LIMITED, has been registered with a capital of £2,000, to acquire the business now carried on by Moffatt and Eastmead, Limited (in liquidation), and to carry on the business of makers of lifts, engineers, etc. The registered office is at 32, Green Street, Blackfriars, London, S.E.

THE RT. HON. A. J. BALFOUR'S 7 H.P. LIGHT PANHARD CAR.

BUSINESS is just now very brisk with the Roadway Autocar Company, judging from the following *resumé* of the deliveries to be made during the next few days. To the Duke of Westminster a 16 h.p. Mors, to Lady Rosslyn a 6 h.p. Mors, to Mr. H. V. Holden, of Ashford, Kent, a 24 h.p. Mors, to Mr. H. Livesey, of Tunbridge Wells, a 16 h.p. Mors, and some four or five Renault voitures. Altogether a very respectable total for one week.

MESSRS. DE DION BOUTON, LTD., recently supplied one of their "Mylord" cars to Mr. A. E. Hambro, a director of the Bank of England. This gentleman has a 12 h.p. Panhard, but the De Dion has proved so satisfactory that within a few days his nephew, Mr. H. C. Hambro, of Seale, Surrey, ordered a De Dion double phaeton. A similar car has also recently been delivered to Mr. Reginald West, a director of the Leeds branch of the Bank of England.

REFERRING to the paragraph in our last issue in regard to a delivery of a number of cars made to Mr. D. M. Weigel, the Panhard and Levassor Company, of Regent Street, S.W., write us stating, "that Messrs. Panhard and Levassor are not supplying cars to Mr. Weigel in view of the fact that we are their sole British agents. If the cars were delivered they were supplied to Mr. Weigel through one of the Paris agencies. At the same time we would point out that our deliveries of stock are far in excess of the so-called deliveries you mention as being the biggest sent to England."

A MILE motor-cycle handicap is to be included in the Lincoln cycle sports to-day (Saturday).

MR. C. FRISWELL is, we hear, leaving London to-day (Saturday), for Glasgow, on one of the latest types of 16 h.p. Mercedes cars.

DURING the present year a part of the London to Oxford main road is to be remade by the Bucks County Council at an estimated cost of £1,000.

WE hear that Messrs. Brown Brothers, Ltd., are experimenting with a chain-driven motor-bicycle, the engine of which is fitted with a free clutch.

A SUSSEX rector has been writing to the county papers, enthusiastically declaring that the automobile is opening out a new era for rural England.

IN the autumn manoeuvres of the Swiss Army, which take place from September 4th to the 20th, motor-cars are to be used both for the transport of men and material.

ACCORDING to a telegraphic despatch from Cape Town, General French has permitted the use of a railway motor-cycle, which is being built, and which will be capable of doing forty miles an hour.

MESSRS. J. M. WADE AND CO., of the Victoria Works, Felixstowe, have excellent accommodation for storing motor-cars. They also stock oils and greases, and undertake repairs of every description.

M. BUCHET, of Paris, has succeeded in producing a 40 h.p. petrol motor which only weighs 8 lbs. 13 oz. per horse power; he hopes to further reduce the weight to 6 lbs. 11 oz. per horse power in an engine of 60 h.p. he is at present engaged upon.

AT a meeting of the Sculcoates (Hull) Rural Council on Tuesday, it was decided to draw the attention of the East Riding County Council to the excessive speed of motor-cars in the district, and ask them to take some steps to control the speed of these vehicles.

THE Cinque Ports Engineering Company, of 14, George Street, Hastings, to whom we referred in our last issue as storing petrol, inform us that they undertake repairs of all sorts to motor-cars, which are done on the premises. The company are official repairers to the De Dion Bouton Company.

FRISWELL, LTD.'S, next motor-car auction, owing to the Glasgow trials, will not be held until September 17th. In the meantime a most extensive stock of second-hand vehicles is being offered for sale by private treaty at 1, Prince's Road, Holland Park, W., these ranging from motor-bicycles up to a 9 h.p. Napier car.

AT the last meeting of the council of the Institute of British Carriage Manufacturers, the Secretary was instructed to obtain certain information in regard to the speed of motor-cars on country roads, and to bring it forward at a subsequent meeting of the council.

AS the number of motor-cars in and around the town of Wexford is steadily increasing, Colonel Magrath of Bann-aboo, Wexford, has written to the local papers stating if owners of horses wish to get their animals used to motor-cars he will be glad to aid them, an offer which we trust will be taken advantage of.

ON Saturday morning last Dr. Newton was driving his motor-car along the High Street, Tonbridge, when, turning a corner, he ran into a horse and cart. The horse began to plunge, with the result that the two hind wheels and the axle of the motor-car were bent, and the horse was thrown down. Fortunately neither the occupants of the trap nor the motor-car were injured.

GENERAL ANDRE, the French Minister of War, and his suite have been visiting the powder works at Vonges and the forts at Langres in a fleet of five motor-cars furnished by Messrs. Cottereau, of Dijon. In the forthcoming French manoeuvres General Brugère will direct the operations from a 24 h.p. Serpollet steam car, piloted by Captain Genty.

THE "Locomotive" Company of America inform us that they are making arrangements for one or two of their cars to be in Glasgow (apart from the two on trial) for the special purpose of

giving trial runs to any persons who are interested in the locomobile. Appointments can be made either by writing to the London office or to Mr. W. M. Letts, at the Grand Hotel, Glasgow.

WE are glad to hear from Mr. Frank Morriss, of King's Lynn, that business in the automobile industry in his district is just now exceedingly good. Mr. Morriss tells us that the past week has been a record one with him, no less than five Daimlers having passed through his hands. As showing the demand for good second-hand cars, he mentions that he recently had sent to him two vehicles, which only stayed two days in his depot.

In addition to motor-quads and tricycles, the Enfield Cycle Company, of Redditch, are now making a "Royal Enfield" motor-bicycle. The frame of this machine has been specially designed for the purpose, and is fitted with the Royal Enfield Flexible front fork, a desirable feature on a motor-bicycle, as it eliminates the vibration from the hands and arms. The fork is of course much stronger than the one fitted to the ordinary Flexible bicycle. For the drive a tandem back hub is fitted and specially strong back stays and chain stays. The engine is a Minerva of the latest pattern.

MESSRS. FRISWELL, LTD., of Holborn Viaduct, E.C., have now received several specimens of the latest type of Peugeot voiturette. The car, which is fitted with a two-cylinder motor of 8 h.p., comprises several modifications, notably the fitting of equal sized wood wheels and the substitution of wheel for lever steering. A feature of the engine is that it is fitted with both tube and electric ignition, which can be used either independently or simultaneously. In the new arrangement no trembler is employed, but instead there is a make and break device on the half-time shaft, this being used in connection with a special high-tension coil. The new electric ignition apparatus is very neatly fitted, and is so attached that by removing two small nuts the whole of it can instantly be detached.

FROM Herr M. Krayn, of Berlin, we have received a copy of the "Automobil-Kalender und Handbuch der Automobilen Industrie, 1901-2." As the title clearly indicates, this is a handbook for the use of German motorists, and although the first year of publication it extends to no less than 556 pages. The first part consists of a diary, after which 100 pages are devoted to mechanical formulae. Explosion motors, carburettors, ignition apparatus are dealt with in the next part, after which are chapters descriptive of the leading types of petrol, electric, and steam cars. A useful portion of the book is that in which a list is given of the places where the batteries of electric vehicles can be charged in Germany—a list which attains proportions which we should like to see equalled in this country. Next come a *résumé* of the regulations relating to motor-cars in the various European countries, a list of clubs, and much other useful information. Although printed in German, being primarily intended for German motorists, the book will afford much useful information to any English automobilist contemplating a tour in the Fatherland.

ARRANGEMENTS are in hand for the holding of an international exhibition in Wolverhampton next year. The guarantee fund already amounts to over £30,000. The Earl of Dartmouth (the Lord Lieutenant of the county of Stafford) is president, and the vice-presidents include a large number of the nobility, members of Parliament, the mayors of neighbouring towns, and prominent manufacturers of the Midlands, Lord Barnard has granted part of the site, and an area of over thirty acres is made up of a portion of the beautiful park, including a lake, belonging to the town. Mr. H. A. Hedley, the general manager of the Glasgow Exhibition, and Messrs. Walker and Ramsey, the architects of part of the buildings of that undertaking, are now engaged in maturing the plans of the beautiful halls in which the exhibition is to be held. In these provision is made for the display of specimens of the finest modern machinery, assurances of exhibits from many leading engineering firms having already been obtained, as well as from manufacturers in other branches of industry. Negotiations are also in progress with several of the Colonial Governments with a view of exhibiting the resources of their countries.

FURIOUS DRIVING CASES.

—8—

At the Barrow Magistrates' Court, on the 16th inst., Leon Vint again appeared in answer to a charge of furiously driving his motor-car in Dalton Road to the danger of passengers on Tuesday, August 6th. A plea of not guilty was tendered. Police-constable Duckworth stated that about 3.15 p.m. on the date in question he was on duty at the corner of Dalton and Abbey Roads, when the defendant passed in his motor-car at a furious rate. He was driving about 15.3 miles an hour. Defendant stated he had no witnesses to call, and a fine of 40s. and costs was imposed.

At Chertsey Petty Sessions, Count Seilern, of Farnham, was summoned for driving a motor-car at excessive speed at Egham on July 31st. The defendant, who attended with his solicitor, Mr. Staplee Firth, pleaded not guilty. All witnesses were ordered out of court. P.C. Day, stationed at Virginia Water, stated that at 4.20 p.m. on July 31st he was near the Wheatsheaf Hotel, when he saw a motor coming from Sunningdale at a furious pace. He went out in the road and held up his hand. The car was stopped. Count Seilern gave his name and address, and said he was only going about fifteen miles an hour. There were several cabs and cyclists in the road, and they were undoubtedly in danger. The Chairman: What do you estimate the pace at? Witness: Over twenty miles an hour. John Aldridge, baker, Middle Hill, Englefield Green, corroborated the constable's evidence. Count Seilern stated that he had driven a motor-car for about three years. He had never had an accident or complaint until last week. He then got two summonses, one for Chertsey and one for Farnham. On the day in question at Virginia Water he had a lady with him in front, and his Swiss *mécanicien*. His motor had not been running well that day, and he was not driving furiously down the hill towards the Wheatsheaf. He had the brakes on, and he was sure he did not exceed a speed of from ten to eleven miles an hour. It was not a fact that he drove away at a high speed after speaking to the constable. When a policeman was behind him he was always particularly careful. (Laughter.) Mr. Firth, in addressing the Bench, protested against the acceptance of evidence which was merely guess-work. He said all policemen seemed to have decided on putting excess speed at twenty miles an hour. He contended that a man could not guess the speed of an object moving in a direct line towards him, as was the fact in this case. He pointed out to the Bench that he knew from his own experience that the police in Surrey were getting most reckless with regard to their evidence on motor driving, and it had happened over and over again lately that the magistrates had to dismiss cases of this kind because they had found that in certain parts the police went out on expeditions to trap motor-cars and take names and addresses, however slow they were going. The Bench imposed a penalty of £5 and costs.

At the Thames Police Court, Arthur Weeks was summoned for driving a locomotive to the common danger in Wellesley Street, Stepney. The evidence of a police-constable and of Mr. H. W. Dyne, a licensed victualler, was to the effect that the defendant turned the corner of Wellesley Street into Hare Street at an excessive speed, the constable giving it at fourteen miles an hour. There were a large number of children about the streets, which were very narrow. The motor-car took the corner so sharply that it tilted on two of its four wheels. The magistrate said that to drive motors so quickly brought them into great disrepute, and set people against them who would not otherwise be prejudiced. The defendant would be fined 20s. and 2s. costs.

At St. Neot's, Arthur Wood, of Streatham Hill, was charged with driving a motor-car at more than twelve miles an hour at Buckden, Hunts, on August 13th. A constable said he saw defendant driving the car at a pace which worked out at twenty-six miles an hour. Defendant was fined £7 10s. and costs.

At Coventry, Charles Kingston Welch, Park House, Warwick Road, Coventry, was fined 10s. and costs for driving a motor-car at a speed exceeding the legal limit. The police evidence was that the car was travelling in the straight mile on the Kenilworth Road at the rate of from twenty-five to thirty miles an hour. In defence, it was urged that the defendant was an experienced driver, and, being on a straight road, there was no danger. The Earl of Craven, who was on the Bench, referring to the evidence as to the speed, said he should like to know how it was arrived at, as he would be sorry himself to say that anyone was going at the rate stated.

At Barmouth Petty Sessions, Eric Ibbetson, Duffryn, was fined £5 and costs for riding a motor-tricycle through the streets at what was described as a terrific speed. Defendant's plea was that he could stop the motor dead if necessary.

At Chelmsford, F. J. T. Horsey, of Finchley Road, London, was charged with driving a motor-car at a greater speed than twelve miles an hour. The counsel for defendant said that nobody believed motor-cars kept within the twelve miles an hour limit. There was a very great personage living at Sandringham who, according to the papers, covered the distance from King's Lynn at seventeen miles an hour. The Clerk: I think it right to say in favour of His Majesty that he can do no wrong. The defendant was fined £5 and £1 18s. costs.

In reference to the above case we have been requested by Mr. Horsey to state that the name of a third party was introduced into the case without his knowledge or sanction, and had he been able to be present in Court such an improper proceeding would have been prevented.

At Portsmouth, Harry Humphries, of the Cycle and Motor-Car Works, South Street, Chichester, was summoned for having, on August 11th, driven a motor-tricycle in Commercial Road and Landport Terrace, Southsea, at a greater speed than twelve miles an hour. Mr. J. M. Bew, solicitor, of Chichester, appeared for the defence. It transpired in evidence that on the Sunday afternoon in question the defendant was watched by a couple of constables (P.C.s Pratt and Sturges), when he was going at a high rate of speed, and by following him upon bicycles, to which "meteoroscopes" were attached, they found he was running at a pace of over sixteen miles an hour. The driving, however, was described as being carefully performed, the defendant keeping wholly upon the tram lines, while the ordinary traffic was small. The defence was that the rate of speed was not beyond ten or eleven miles an hour, and the defendant in that statement was corroborated by Mr. Rogers, of Farnham. The magistrates intimated that they felt bound to accept the evidence of the police, but they inflicted only the small penalty of 15s., including the costs.

At Beaconsfield, Arthur Rackhaw, motor-car driver for Mr. Louis Fleischman, of Burnham, was summoned by the Bucks police for driving his motor-car at a greater speed than twelve miles an hour. A police-constable stated that he saw the defendant driving 1 mile 210 yards in two minutes six seconds, which worked out at 31 miles 1,725 yards an hour. Deputy Chief Constable Sutton said that the defendant passed him on the way to court at sixteen miles an hour. The Bench inflicted a fine of £5 and £1 costs.

Two motor-car drivers were fined, at the Huntingdon Police Court, on Saturday last, for furious driving. Frederick Ryde, engineer, of Ealing, who was said by a constable to have driven a quarter of a mile in thirty-five seconds, was fined £5 and costs, and Ean Francis Cecil, of Stocken Hall, Oakham, a lieutenant in the army, was mulcted in £10 and costs, the constable stating that he saw defendant drive half a mile in one minute on Sunday, July 28th.

At Chertsey, Charles Fournier, a Frenchman, was summoned for driving a motor-car at a greater speed than twelve miles an hour, at Thorpe, on August 6th. P.C. Pickett said he saw the defendant, who was with the owner of the car, driving down Staines-lane at eighteen miles an hour, just before eight o'clock on the evening in question. Witness stopped the car and said to the defendant, "You are going rather fast," but the owner of the car intervened, remarking that they were not proceeding faster than was allowed, and that there was nobody in the road. Witness saw the defendant first against the Fishing Temple. The car went half-a-mile in one minute seventeen seconds. By Mr. Spyer, who appeared for the defence: Witness was not specially told off for the duty. He had never had a similar case before. The defendant stopped directly witness held up his hands. He stopped within twenty yards, while travelling full speed. P.C. Edwards, Egham, corroborated. Mr. J. M. Brown, who was in the car, was called for the defence, and stated that he thought the car was proceeding at the rate of about ten miles an hour. The defendant said he had had considerable experience in driving motor-cars. He was not going eighteen miles an hour. If that had been the pace at which he was going he would have run over a policeman. Fined forty shillings and costs.

At Bournemouth, Ernest Starr was summoned for driving a motor-car to the danger of the public. He pleaded not guilty. P.C. Rose said that on the 10th inst. he saw defendant driving a motor-car at the rate of about 15 miles an hour toward the Square. Witness shouted to him to stop, but he took no notice and drove straight on. Soon after, when defendant was returning from the Square, witness asked him why he did not stop when called upon to do so, and defendant replied that he did not see witness. Superintendent Foster said there had been several complaints from residents against drivers, this one in particular. Fined £1, including costs. A further charge was brought against defendant by P.C. Sumner for furiously driving on Thursday, the 15th. The constable stated that defendant was driving in the Old Christchurch Road on the wrong side and nearly ran into a horse attached to a carriage. The Bench convicted, and a fine of £1, including costs, was imposed.

At Bournemouth, Bertie Oran, motor-car driver, was charged with furiously driving a car in the Old Christchurch Road on the 16th inst. P.C. Sumner said he saw defendant driving a motor-car in the direction of the Arcade at a rate of about 13 miles an hour. Defendant passed between a cab and a bus and nearly collided with the cab. When defendant was on his return journey witness stopped him and asked him why he went down the town at such a rate. Defendant replied that he was not going very fast; only about eight miles an hour. Fined 5s., and 7s. costs.

At the Guildford Petty Sessions, Mr. C. N. Williamson, of White Hall, Hampton Court, was summoned in respect of furiously driving his motor-car. A Mr. Honey, a farmer, was the complainant, and stated that when driving on the Ripley Road with a young restive horse he saw a motor-car coming. He put up his hand, but the driver of the car took no notice except to go faster, and this caused the horse to dash off the road into the ditch, overturning the cart and all that was therein, leaving everything in a pretty mess. He swore the car was going over twenty miles an hour. His man supported the master's evidence, and gave as a reason for judging speed that he had been out on service in South Africa, and learnt how to judge speeds there. The farmer said he calculated a furlong on the road, and that Mr. Williamson covered the furlong in twenty-two seconds. He

admitted to Mr. Staplee Firth, who defended, that this was guess work, but insisted that it was practically an infallible calculation. He spoke too soon, for he was at once challenged to give a demonstration in court of guessing twenty-two seconds. Mr. Firth gave him the word to go. It was noticed that the majority of the Bench took out their watches, and much was the amusement when this champion witness declared that the twenty-two seconds had expired, when in fact only eight seconds had elapsed. He also admitted that he intended to claim for damages in a civil action. The Bench dismissed the case.

At Farnham Police Court, last week, Mr. Staplee Firth, solicitor, made an application in the case of Count Seilern, of Frensham Place, who on the 8th inst. was fined £10 and costs in two summonses for driving his motor-car at excessive speed. He said that the summonses were only served on the 5th (Bank Holiday), and on the 6th the Count came to London to consult him. As the Count had to go to the Isle of Wight, and he (Mr. Firth) was engaged in the High Court on the 8th, it was impossible to get up the evidence in one day, and he wrote on August 6th to the magistrates asking them to adjourn the hearing. He was astonished on receiving from the magistrates' clerk a letter, in which he said that the magistrates had determined to proceed with the hearing, and, after hearing three witnesses in each case, had fined the Count £5 and costs in each case, for which he would send a cheque. That placed Count Seilern in a very awkward fix. He should have been able to prove, and he thought anyone could have done if the case had been properly thrashed out and heard, that there was no evidence on which the Court could convict. Besides that, the Count had been put down, as the chairman expressed it, as being concerned in "the worst cases he had ever heard of," and that in his absence. He asked for an adjournment of the hearing. The Chairman: The Bench cannot grant your application. Mr. Firth: As a matter of personal convenience to me, as I shall be in Scotland at that time, will you adjourn it to the 12th? The Chairman: You have our decision, and that is sufficient.

LEAVING WITHOUT NOTICE.

At Bournemouth County Court, The Bournemouth Motors, Limited sought to recover from William McArdle £6 13s. 6d. wages in lieu of notice and damages caused by the defendant leaving his employment without giving notice. Mr. Chilton, who appeared for the plaintiffs, said the defendant was employed by the plaintiff company as a motor-car driver, and left without giving notice on a Monday afternoon, having been paid his wages up to the previous Saturday. The details of the claim were £1 10s., a week's wages in lieu of notice, and £5 3s. 6d., loss of profit in consequence of the plaintiffs' inability to fill the defendant's place. Francis Joseph Bell, managing director of the plaintiff company, said defendant was employed by the company, and taught the business of a motor-car driver, and remained in its service for about a month. He then left, but came back, and at his application was re-engaged at 30s. per week. He had only been employed a short time when he failed to turn up to work, and witness saw him subsequently driving the motor-car of another company. It was, of course, difficult to get a licensed motor-car driver at a minute's notice, and the car was idle for ten days. In making the claim he took the books and found that the average takings of the car for a week were £11 3s. 6d., and the working expenses were about £1 a day. Cross-examined by Mr. Tattersall, witness said that there was no specific agreement that a week's wages should be paid in lieu of notice. £1 10s. had been paid into Court. The defendant McArdle, called by Mr. Tattersall, admitted that he left without giving notice. He had paid £1 10s. into Court in lieu of notice. He left on the Monday, and he saw the car out the next day, driven by a man named Parsons. With regard to the profits, his experience was that if a car made £3 a week gross profit it was a very good week. The net would not be more than 30s. His Honour gave judgment for £3, including the sum paid into Court.

MR. ELMER APPERSON recently made a trip in one of the standard Haynes-Apperson two-passenger carriages from Kokomo to Chicago, covering the distance of 205 miles in thirteen hours, or at an average of a little less than 16 miles per hour. Those acquainted with the roads in that section of the country consider that the performance is a very creditable one.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, SEPTEMBER 7, 1901.

[No. 131.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

KING EDWARD left Homburg on Thursday last for a short visit to the Danish Court, *en route* for London and Scotland. His Majesty has derived much benefit from his stay at Homburg. During the early part of his visit he seldom went out except upon a motor-car; but later His Majesty's health so far improved that he was able to play golf. King Edward is, however, too enthusiastic an automobilist to abandon his favourite form of exercise,

even for one of a more athletic nature, and from first to last scarcely a day passed without His Majesty taking one and sometimes two runs on a motor-car. So much interest did the good people of Homburg evince in His Majesty's going and coming that it was found necessary on more than one occasion, in order to avoid a popular demonstration from the crowd assembled outside Ritter's Park Hotel, to send the car away empty. On the dispersal of the crowd the car would return and His Majesty depart without ostentation. Queen Alexandra, during her stay at Fredensborg, has also taken frequent rides on an automobile, often visiting Copenhagen on shopping expeditions.

Motor-Cars in Manœuvres.

WRITING to *Country Life* of his experiences of both the cavalry and cyclist manœuvres, the Hon. C. S. Rolls remarks that in the first of these the military mind was suspicious as to the capabilities of the motor-car. That it could travel across country was doubted till one or two runs of this nature had established its right to the advantages claimed in that respect, and added enormously not only to the ubiquity of the commanding officer, but also to the precise information forthcoming. Perhaps the most thrilling episode of the whole period was that of the officer who travelled twelve miles, rushed the enemy's outpost, drove right into their camp, got the information he was sent to get, and was away, returning at top speed by another route before anyone had time to recover from the astonishment which his presence caused and give chase or cut him off. As illustrating another useful phase of the motor-car in military operations, Mr. Rolls says of the cyclist manœuvres: "Sudden information was received that Lord Roberts, the Commander-in-Chief, wished to see the whole of the Cyclist Corps on parade at Queen's Ground at 8 a.m. This order was quite unexpected, and did not reach us till about 7.30, at which time various companies of cyclists were somewhat widely scattered about the district, having been out since six o'clock; accordingly, the General was driven back to the parade, and motor-cars were sent out to collect as many of the cyclists as could be found, and they succeeded in bringing in almost all, though one or two sections, which were found in outlying districts, arrived somewhat late. This feat could not have been accomplished by any other means."

The Speed of Motor-Cars in Scotland.

A NEW Order which has been made by the Secretary for Scotland with regard to the speed of motor-cars will give great satisfaction to Caledonian automobilists. The effect of the Order is to raise the limit of speed for light locomotives and motor-cars in Scotland from ten to twelve miles an hour. It is well known that the Locomotives on Highways Act of 1896 placed a limit on the speed of light locomotives, the section relating to pace reading: "No light locomotive shall travel along a public highway at a greater speed than fourteen miles an hour, or than any less speed that may be prescribed by regulations of the Local Government Board." It is also well known that this moderate maximum was reduced to twelve miles an hour in England under the powers given by the Act. In Sub-section 10 a reference to the Secretary for Scotland is substituted for a reference to the Local Government Board, and thus it came about that the reduction of the limit to twelve miles an hour, which was made in the case of England, suffered a still further curtailment in the case of Scotland, where the arbitrary and inadequate maximum of ten miles an hour has hitherto been in force. Thanks to the efforts of the Automobile Club the maximum limit of speed has now been raised to twelve miles an hour and the regulation as to pace thus assimilated with that in force in England.

What the Motor-Car is doing for France.

THE great activity which during the past few years has characterised the automobile trade in France has caused Mr. Thornwell Haynes, the United States Consul at Rouen, to prepare an elaborate report on the subject. Mr. Haynes intimates very plainly that the manufacture of automobiles is doing more, directly and indirectly, to stimulate business, and, consequently, to add to France's general prosperity, than any similar industry in which the people of that nation have ever engaged.

Appearances.

THE appearance of the participants in the 1,000-miles trial when they arrived at Bristol, after the first day's journey, was the cause of much gay writing in that section of the press opposed to automobilism, and recent pictures of racing *chauffeurs* in the Continental press have occasioned similar disparaging comment. One little journal which is said to be concerned with scraps of science deplors the coming of the motor-car as an anti-artistic force in this country, and urges that when the automobile comes into its rightful inheritance there will be little opportunity for the display of the present fashionable accoutrements associated with driving. Fashion is a changeable habit and can soon accommodate itself to new conditions, and this peevish objection is not likely to impede the progress of the new movement. But it illustrates the point that the prevalence of racing on the Continent is responsible for some of the prejudice excited in more conservative England.

The Wiseacres and Slow Coaches of Dundee.

SCOTLAND is rather backward in motor-car matters, and the Glasgow trials should do something to dispel native ignorance on the subject. We are led to write thus bluntly because of the attitude of the Dundee magistrates towards Messrs. Irving Brothers, of that city. They applied for a licence to run a motor-car on special occasions, and a route between the High Street and a local flower show held on Magdalen Green was mentioned. After some discussion it was suggested by the Bench that the vehicle should run via the Esplanade, as the route proposed was generally lined with people in the evening. Ultimately it was decided that the matter should be left to the chief constable and the applicants. This is a very absurd way of dealing with the matter. The magistrates cannot prevent a score of private motor-cars using the route suggested by Messrs. Irving, and we hope every motorist passing through Dundee will make a trip that way. Why then should a business firm be excluded? The fact that the route is one along which people walk in crowds testifies to the public need, and it is hoped one result of the present trials will be to show the people and magistrates of Dundee, in common with the rest of Scotland, the value of the motor-car in the rapid transport of people. If motor-vehicles were used in busy thoroughfares it would be an advantage, for the streets would be considerably clearer of traffic owing to the lessened space required by automobiles and the accelerated pace at which they move—when compared with those horse-drawn methods of the nineteenth century which still survive. But, after all, these Dundee slow-coaches are pretty wide awake, for they nodded their heads, and the Lord Provost concurred, when Chief-Constable Dewar said he objected to the motor-cars running in opposition to the Corporation tramways.

THE HON. LEOPOLD CANNING TOURING ON HIS CENTURY MOTOR-TANDEM.

The Folly of a Horse Driver.

A LEADING Yorkshire paper has been opening its columns to the plaintive wails of a Shipley gentleman, who had three frights in one day while driving "a young horse that had never seen one of these (motor) carriages." All we can say is that the man who does not accustom his horse to a motor-car before trusting him on the road is woefully behind the times. No horse should be allowed on the public highway—unless the driver is willing to take the risk—without a course of elementary education. And no equine curriculum is, nowadays, complete unless it includes the automobile.

Local Helpers.

INDIVIDUAL motorists throughout the country can do much to allay popular prejudice by sending brief and lucid letters to the local press whenever undue or unfair prominence is given to accidents happening to motor-vehicles. Much good work has already been done by this means, and we are always

pleased to see the persistence with which some gentlemen educate the editors and readers of country newspapers. Mr. Archibald Ford has just had an excellent letter in the Liverpool papers on the subject, in which he shows how generally accidents to horse-drawn vehicles are ignored—because of their common occurrence—while the novelty of the motor-car is the newspaper excuse for chronicling mishaps, etc., in connection with its progress. Often this arises from the inexperience of the driver, or the desire of novices to go beyond the legal limit and similar causes unconnected with the mechanism of the car. These are points which should always be made clear in local papers whenever trivial incidents are exalted into catastrophes.

For Week Ends.

EVIDENCE of the popularity of the motor-car among pleasure seekers has been found during the present summer by the absence of cars for hire at the leading firms in London. Between Thursday and Tuesday the number of automobiles available for hire has been altogether inadequate to the demand, and not a few private owners, who have not wanted their cars for the week end, have found a source of profit in letting them to friends and other people who have advertised for motor-cars for week-end trips. This is a branch of the industry likely to prove lucrative in the near future, and one that Metropolitan firms will do well to regard with attention and care. Cars have not only been booked weeks in advance but inquirers have been offering excellent prices.

The Tour of an Electric Car.

THE powerful electric car of the British and Foreign Electrical Vehicle Company successfully completed its tour to the North on Friday last week. We met Mr. Theodore G. Chambers in the garage in the tramway stables in Glasgow on Saturday, and got from him a few particulars of the trip. In our last issue we left the car on its way from Lancaster to Carlisle, which was reached on the Tuesday evening. Here trouble was experienced in getting the batteries recharged, an operation which was not completed till late the next day (Wednesday), causing the party to be out travelling all the night. Thursday found the tourists at Sanquhar, where they were entertained by Mr. McConnell, the proprietor of some collieries in the district, and the batteries recharged. Another night journey ensued, Glasgow being reached about five o'clock on Friday morning. The British and Foreign Company are naturally proud of the achievement, for it is the first time such a long journey has been attempted and completed by an electrical vehicle.

The Speed of Motor-Cars.

THE question of the speed of motor-cars is still receiving the attention of the town, county, and district councils throughout the land. At a meeting of the Canterbury County Council last week the chairman asked the town clerk if they had any bye-law to limit the speed of motor-cars while passing through the city. Without wishing to throw cold water on a new invention, he had seen several examples of rapid travelling which were dangerous to the public, and especially to children. Councillors Godden and Burren gave instances of reckless travelling through the city, and urged that steps should be taken to bring the drivers under control. Alderman Cross proposed that a bye-law be framed to limit the speed of motor-cars to eight miles an hour in the city, but it was eventually agreed that the town clerk should look into the law on the subject and report at the council meeting next week. On Monday the Darlington Rural Council decided, in consequence of the frequency and serious character of motor-car accidents, to bring before the Local Government Board the desirability of enforcing registration of such vehicles and compelling drivers to carry both in front and at the rear of their cars a conspicuous number which would assist identification in case of accident.

Beverley Reasonable.

At a meeting of the Beverley Rural District Council, on Saturday last, the Chairman, in moving the adoption of the minutes of the Highways Committee, stated that as Chairman of that Committee he had received numerous complaints with respect to the alleged furious driving of motor-cars in the district. It appeared to him that the District Council had nothing whatever to do with the matter. They had in that Riding a well-paid and very efficient chief constable, and an efficient police force, capable of looking after the interests of those who had to use the highways, and of enforcing the laws for the regulation of the traffic. He would like to say that as this new means of locomotion had come to stay, and ultimately, in his opinion, would benefit all classes, it behoved those who at present drove them to do so in such a way as not to raise public opinion against them to such an extent as would retard the development and general use of these vehicles.

The Postmaster-General on Motor-Cars.

LAST Sunday, by the kindness of Lord and Lady Londonderry, some twelve hundred cyclists attended a church parade at Wynard Park, Stockton-on-Tees, the residence of the Postmaster-General. At the conclusion of the service the company assembled at the cricket pavilion, where a vote of thanks was passed to Lord and Lady Londonderry for their kindness in throwing open their beautiful grounds for the parade. His Lordship, in a characteristic speech, said he was extremely pleased to welcome them. He proceeded to remark upon the development of the cycle and motor-car for business. He believed that motor-cars, as they improved, would be found not only of the highest convenience, but economical in use. He was having one built for himself, but it would not be geared beyond sixteen miles an hour. He was filled with consternation at the furious speed at which motor-cars were driven, and thought they should not be allowed to proceed at a greater pace than a pair of horses could be driven at.

Amusing but Annoying.

IN the course of a letter to a Liverpool newspaper a northern automobilist relates a few of the incidents of his travels to show through what befogged lenses the general public regard the slightest movement on the part of a motor-car. When touring in a remote part of Cheshire he found, while passing through a village, that a small screw, scarcely half an inch long and of no importance, had been lost from somewhere in the region of one of the axles. The motorist called at the local cycle repairer's and had it replaced, afterwards continuing on his journey. Imagine his surprise on seeing in a country paper, the very next Saturday, a paragraph of goodly length, headed in large type, "Motor-car Accident," and a description of himself (name and all) as having had a breakdown and put up for repairs at this identical shop in that particular village! The same motorist relates the following story:—"Someone said to me the other day, 'There is a fine red motor-wagonette just gone along, but it's round the corner there; they've had a breakdown and are mending it. They can't get it to go.' I hastened to view the disaster, and there I beheld the owner of the car filling up his water tanks!"

Where to Draw the Line.

A CORRESPONDENT informs us that while out with a friend the other Sunday the exhaust valve of his motor-trike broke. They were passing through Colchester at the time, and seeing a cycle shop open (a C. T. C. repairer) they naturally entered it, hoping to have the matter put right. Whilst waiting they distinctly heard someone say, "Whatever they want, say we have not got it." A girl came out, and when asked for an exhaust valve, gave the answer they had overheard. Asked if they did business on Sundays, the girl replied, "No, only hiring-out trade on Sundays." The trike was towed by a Pieper car to

Chelmsford, where it was left in the capable hands of Mr. Knight. Our correspondent advises motorists to carry any spare parts that may go wrong, for should they be stranded at Colchester they may know what assistance to expect on a Sunday. If the cycle repairer in question has a lingering regard for Sabbatarian principles, to draw the line at selling parts, as a set-off against hiring-out, is a curious way of arranging the matter with his conscience. A reference to a certain portion of the Scriptures, which deals with an ox in a pit, might help him to a more equitable judgment.

The Yorkshire Automobile Club.

THE members of this club will hold a short run to Knaresborough to-day (Saturday). Leeds members will meet at the City Square at 2 p.m., and Bradford members at Mannington Park (Lister Monument), at the same hour. The two detachments are timed to meet at Pool Bridge at 3 p.m., whence the start for Knaresborough *via* Follyfoot will be made fifteen minutes later, arrangements for the return journey being made *en route*. The committee have heard of various cases of members not attending the runs because they thought that they would be outdistanced by the larger cars and cycles. They ask us to point out that this cannot occur, as stoppages are frequently made along the route, preferably outside towns and villages, to enable members to reassemble. It is hoped therefore that all who can possibly be present will endeavour to do so. Suggestions from members as to destination and route of any future Club runs will be cordially welcomed by the Committee.

M. DANNAT ON HIS 50 H.P. MERCEDES CAR.

Horses and "Diabolical Phenomena."

ALTHOUGH not particularly partial to the automobile, Sir Edmund Monson, our Ambassador to France, has rendered a service to owners of motor-cars by giving the results of his observations in Paris and in France. He calls motor-cars "monsters" which produce the impression of a "diabolical phenomenon," and justifies his superlatives by the glaring colours in which they are painted, the excruciating noise which they make, and the asphyxiating odour which they emit. And then he is observant enough and sufficiently fair minded to say that "neither my own horses nor those of any of my acquaintances have ever, as far as I know, had their equanimity disturbed by these offensive apparitions; and at this little seaside town (Houlgate, Calvados), where the proportion of motor-cars to the number of the inhabitants and visitors is even more striking than at Paris, and where the utmost recklessness, as I know to my

cost, is shown in driving them at express speed along the narrow streets, neither the saddle nor the carriage horses show any restiveness or alarm at their vagaries. My belief is, that as soon as the use of the motor-car becomes more general in England it will be found that horses will be as indifferent to them as they now are to the railway train." Seeing, therefore, that the shying of horses may be attributed to the nervousness of drivers, why attempt to obstruct the coming of the motor-car?

Against Furious Driving.

WHILE we always deplore harshness in dealing with motorists whose conviction depends on the unsupported evidence of a police constable, we, in common with all motorists who are concerned with the future of our pastime, equally deplore the folly of those drivers of automobiles who show no regard for the feelings of pedestrians and the nerves of passengers in horse-drawn vehicles. We expect ordinary good manners from every class of traffic on the road, and, to justify our expectation, must display similar sensibility ourselves. Such should be the attitude of motorists. Scorching along the public highway to the horror of nursemaids and the danger of elderly persons is to be condemned—whether in the case of cyclists, motorists, or horse-drivers. Some of our contemporaries delight in recording the cases of furious driving recorded against automobilists. Why do they not give similar attention to the hundreds of cases every week against drivers of ordinary traps and carts? We have become so accustomed to the latter that their frequency does not frighten; it is the novelty of the motor-car prosecution that gives its interest to the newspaper reader.

Automobile Sporting Club.

WITH the objects of the Automobile Sporting Club, which is being established at Burgos House, Sydenham Road, North Croydon, all motorists will agree, but is there not the fear that the title may create some confusion with the premier authority in Whitehall Court? The club is intended for automobilists and lovers of sport generally in the Croydon district, and the house stands in its own grounds, with stabling, cycle, and motor-car accommodation. Luncheons, dinners, etc., will be provided, and reception rooms provided for the convenience of lady visitors. The headquarters are near four railway stations, and within easy reach of Epsom, Sandown, Hurst Park, Gatwick, and Lingfield, so that its location should appeal strongly to sporting men. The club will be conducted on the proprietary system. The general committee includes His Highness Prince Aiyah, Captain Gerrard Buller, Colonel George Montagu Hicks, Viscomte d'Olivera, and the Hon. Charles Blake; while Mr. R. J. Cholmeley, B.A., is the secretary, to whom the annual subscription of one guinea should be sent.

The Stop-Watch

VARIOUS have been the means to which the police have resorted in their persistent and irritating efforts to secure convictions against motorists. From placing trunks in the road, to the use of field-glasses, telephones, and stop-watches there are many devices to be selected for adoption; and most of them commence with the assumption that the automobilist is a person to be proceeded against. Having that end in view, the police should have little difficulty in securing evidence. After toiling up a hill, the motorist may find a steep descent along a straight, unfrequented road, down which he goes at a rapid pace, pulling up when on a level road again. But half way down the hill a constable may have been lying in waiting with a stop-watch (as is used in the county of Surrey), and at the bottom of the hill is a brother officer. Subsequently, comparing notes and watches, it is easy to prove excessive speed with a resultant conviction. And the police pride themselves on their excellent intelligence. But is it justice?

Carriage Builders and Motor-Cars.

THIS is a subject that has been freely written about in our columns, and a recent reference in the *Coachbuilders' Journal* leads us to again recur to it. Our contemporary is urging those who have hitherto supplied vehicles intended to run behind horses to give heed to the requirements of the age, and not to allow the motor-car industry to jog along without their help. This is very good advice, and has been anticipated by the carriage builders of the United States, who were quick to realise the value of the automobile industry. Even within the last few months a great improvement is noticeable in the body-work of motor-cars, and only the other week did we refer to the altered appearance of the coachbuilders' parade—viz., Long Acre. Hence our contemporary is right in its advice to coachbuilders, the enterprising members of which trade should at once recognise the possibilities that are within their reach if they will run with the times—or, to be more correct, the automobile.

"Killed by a Motor-Car."

SUCH was the startling headline which caught our eyes in the *Islington Gazette* recently, and beneath it we read with distress the following:—"On Saturday information was forwarded to Dr. G. Danford Thomas, corner for Central London, of the death of John Waters, aged four years, who on Friday afternoon ran from the pavement at King's Cross directly in front of a motor-car, and before the driver could pull up the machine, was knocked down and received severe injuries. The child was picked up and taken to the Royal Free Hospital, Gray's Inn Road, where, on being examined by the resident medical officer, life was found to be extinct. An inquest will be held in due course." Naturally we watched with a sad interest for the details which the inquest might divulge, and read the following with a sigh of relief a week later:—"Mr. Walter Schroder held an inquest at the St. Pancras Coroner's Court with reference to the death of John Waters, aged four years. Evidence was given that deceased's mother left home, telling her elder son to put the deceased to bed. The boy took the deceased out, and being joined by another boy, the three went on a toy 'motor,' consisting of a straight board on four perambulator wheels. They went into Rosebery-avenue, and whilst descending a gradient the 'motor' collided with a van belonging to Messrs. Pickford and Company, and overturned. The hind wheel of the van passed over the deceased and the third boy. Deceased died soon after his admission into the hospital, from the effects of internal injuries, whilst the third boy was found to have received severe injuries to his arms. The Coroner said that he did not know these playthings were called motor-cars, but it was evident that they had adopted the latest fashionable term. The Jury returned a verdict of 'Accidental Death.'" There be motor-cars and motor-cars, and the enterprising news-hunter of the *Islington Gazette* should even without technical knowledge be able to discriminate between the egg-box on discarded perambulator wheels and the genuine article, presuming of course that he is a man of average intelligence. The motor-car proper has sufficient prejudice to contend with on its own account without being saddled with the sins of the home-made infanticide appliance.

MR. EDGAR SMITH, of 5, Broad Street, Halifax, has been appointed local agent for "Mayfair" voiturettes. Mr. Smith also keeps a stock of accessories, Carless Capel's petrol, greases, etc., and is opening works for the repair and storage of cars.

THE three gentlemen injured in the recent accident near Doncaster, Major Cradock, Captain Laycock, and Captain Wilson, are, we are pleased to say, making satisfactory progress. Captain Laycock has been out a little during the past week. The other gentlemen will not be able to go out for some considerable time. Major Cradock, who was by far the most seriously injured, is only progressing slowly, though he is as well as can be expected.

The Big Event of 1901.

THE GLASGOW RELIABILITY TRIALS.

GENERAL VIEW OF THE GLASGOW EXHIBITION.

EN ROUTE FOR SCOTLAND.

ON Tuesday last week, when we retired to rest, the prospect of motoring on the morrow seemed remote indeed—the rain was pouring in torrents and the forecasts were all against an immediate amendment in the state of the weather. However, on awakening the next morning, a cloudless sky was seen, and, by previous arrangement, our car arrived punctually at six o'clock. Fifteen minutes later we were all on board, and a start was made, *via* the Hampstead Road and Heath, for Barnet, which was reached at 7.5 a.m. The morning, albeit bright, was extremely raw and thus early the force of the wind was felt. Welwyn Church was reached at 7.50, Baldock at 8.33, and Biggleswade at 8.57. A stop was made at Dan Albone's for breakfast, and while waiting we had a run through our host's factory, which we found fully employed in the manufacture of motor-bicycles. These seem to have struck the popular fancy, for we learnt that the proprietor has a large number of orders on hand. The works are well adapted for those in need of repairs, and the facilities for recharging batteries are such as will commend themselves. At 10.15 another start was made, and a stiff head-wind soon made itself felt. The cold was extreme and, what with troublesome horses and frightened drivers, travelling was the reverse of pleasant. The sixty-fourth milestone from London was reached at 11.15, and the eighty-second milestone at 12.15 p.m., the wind in the open country around Wansford almost blowing the car to a standstill. At the ninety-sixth milestone, reached at 1.14 p.m., a stoppage was made to change batteries, the motor, which had not been "pulling" over grandly all the morning, having slowed considerably. At two o'clock we reached Grantham (110 miles), where a stoppage of fifteen minutes was made. At 3.15 we were 130 miles from London, and ultimately arrived at Retford at 4.5, where a stop for refreshments was made at the White Hart, an inn to be commended to all passing through that district. We left at 5.15 p.m., arriving at York at 8 o'clock. York we should imagine to be one of the worst lighted cities in the Kingdom, and it was with difficulty that the Station Hotel was found. The races being on, a private villa was recommended, whither we made our way. The place was certainly clean, but the charges for apartments (two rooms)—21s.—we certainly

considered extortionate. Stabling at the Windmill for the night cost 3s. 6d.

The morning was opened by our *mécanicien* (Budd) grinding in the exhaust valves, which were in a bad state, and by ourselves rambling round the old city, therefore it was not till between three and four o'clock in the afternoon that our journey to the north was continued. The day was lovely—a marked contrast to the previous one—and our route lay through Northallerton to Scots Corner, the road being good as well as pretty. At Scots Corner, which we had some difficulty in finding, the character of the roads changed into a long, narrow lane, switchback in conformation, and for miles neither habitation nor human being were seen. At Greta Bridge a halt was made, the beautiful meeting of the waters—Tees and Greta—being well worthy a visit. Beyond here is a long hill with a very steep portion, and on this the motor stopped. The sprag, fortunately, held, and, although for a moment things seemed uncomfortable, we were enabled, ultimately, to reach the top. Bowes, (279 miles from London) we had intended to be our stopping place for the night, and four miles from that bleak and inhospitable village—scene of "Dotheboys Hall"—the roads were simply a mass of ruts and stones. When we reached Bowes our hearts sank within us. There was only one inn, and that we would not stop at. The character of the cottages did not commend themselves any more than the appearance of the villagers. "Poor Smike" seemed reproduced in many a ragged urchin, and when the rain began to descend matters were felt to be in a desperate plight indeed. "What to do?" and "Where to sleep?" these were the questions. Darkening clouds were gathering and the pitiless rain was descending. For miles previous to entering Bowes, buildings forming what looked like a gigantic city had been seen, and from the frequency of the sign posts pointing to Barnard's Castle it seemed that must be the haven; so our car was turned, and, descending the hill, we saw a sign post—four miles to Barnard Castle. The car, after the attention to the valves, had been pulling better—forty-six miles in two hours—and so, after all, the four miles back did not worry us much, although the rain was pouring hard. As a matter of fact, the journey was all down hill—and such a hill! The time taken was phenomenal, and our hearts sank as we realised we should have to return by the same route in the

morning. One portion of the hill seemed almost vertical—it must have been about one in six. It looked steeper than the famous Porlock Hill. At the bottom of the hill was a bridge over a river, and at the corner an inn. A woman stood at the door, and as there was a right and left turning, neither seeming to lead anywhere, and the town being invisible, we inquired where it was. "I don't know," in the vernacular of the district, was the response. We did not like the look of the bridge, which was short, narrow, and rose to a point in the centre. We, however, risked it and immediately entered a dirty narrow street, with common lodging-houses on either side and half-naked inhabitants lying about in all sorts of disgusting attitudes—in fact it was a region of the most squalid poverty we had ever seen. At the end of this street we came to the bottom of another precipitous hill, and as there seemed no alternative we began climbing it, inquiring occasionally whether there was any hotel in the place. The people all being apparently deaf, the car was stopped and enquiry was made in a shop, when we were told, with a look of astonishment, that there was the "King's Head." This we made for, and although, as we were afterwards informed, it was the inn where Dickens had written "Nicholas Nickleby"—well, we never want to set foot in the town again.

Shortly after nine o'clock on Friday morning we made a fresh start, the rain still falling heavily. Our brakes had been specially looked to, and descending out of the town we turned into the narrow lane—there being only just room for the car to go through—crossed the bridge, and commenced the ascent to Bowes. We had not travelled far before the motor stopped. All had to alight, and ultimately ignominiously push the car up the hill—a most unpleasant task for ladies, with the rain pouring and the surface of the road thick with greasy mud. However, Bowes was again reached, and our journey—over the Skiddaw—to Brough continued. For thirteen miles the surface is about the worst in the kingdom, we should imagine. To call it a road is ridiculous. It is a grass track, and we felt it was considerate of the authorities to place stone posts for some miles to mark the track, otherwise wayfarers would be lost on the hills. The rain poured and drove, the hail descended and stung, the wind nearly blew our breath away; but still, after all, we did not mind it much. The car kept steadily on, and we were weather proof, thanks to Burberry's gabardines. Our journey for the day was a short one, and the rain could not keep on forever; as a matter of fact, it stopped just before entering Carlisle, a distance of forty-two miles. Here we stayed two hours, visiting the cathedral where Sir Walter Scott was married. The afternoon turned out lovely, so our wraps were laid aside and a most beautiful run was enjoyed.

At Gretna Green a halt was made at the post office for a paper, and we learnt that there was only one post a day, which arrived at 5.45 in the morning. The *M.C.J.* had consequently not arrived. Our next stoppage was at Ecclefechan, where a visit was paid to the shrine of Carlyle; after which we proceeded to Lockerbie, where we stayed the night. The "King's Arms" was the name of the inn, and we can assure our readers that the remembrance of that inn is as an oasis in the desert of our memory of swindling landlords. Our readers can safely stay there and rely upon securing such creature comforts as are most welcome to travellers in these little isles of ours. We deeply regretted departing in the morning, and trust that, if the Fates are kind to us, at least a week out of our brief existence will be spent there on some future occasion. The name of the place is a pleasant memory to us.

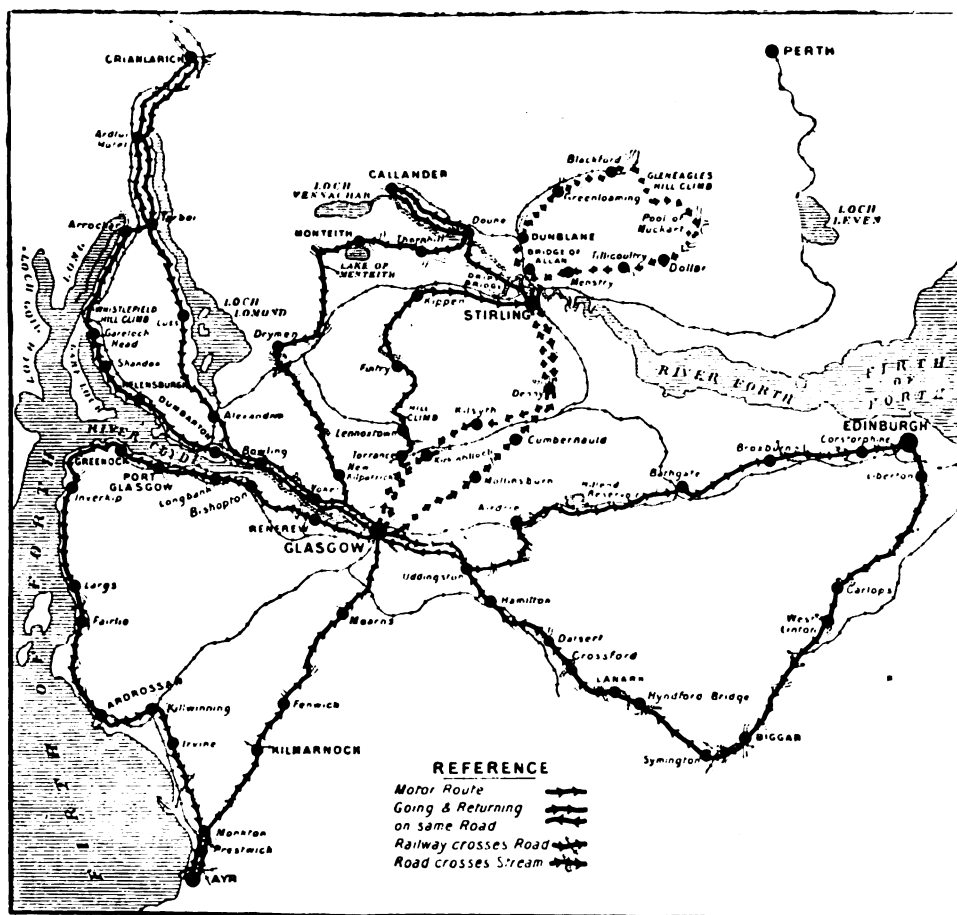

Saturday morning opened gloriously fine, and found us rambling over the beautiful hills. It was late when a start was made, and the crisp, invigorating atmosphere made our hearts glad within us. The car was pulling indifferently, but we made progress, and the ride over Beattock Summit and on to Abington, through continuous hills, was much enjoyed. At Lesmahagow—where quite a number of motorists on their way to Glasgow had strayed—we had luncheon, and afterwards proceeded to Glasgow, where we found that most of them had arrived.

IN GLASGOW.

Before dinner we proceeded to the garage in Kelvinhaugh Street, after having sampled our rooms, which were found according to arrangement. The accommodation is of a most ample description, the premises having formerly been a tram-car shed.

They are well lighted by electricity, and there is every facility for cleaning, etc. At the time of our visit there were forty-three cars in the shed, and the general attention of the visitors seemed to have been concentrated on two new Star cars, which had been entered at the last minute. During the afternoon the cars which are taking part in the trials were tried as to the efficiency of their brake power on a steep hill by Lieut. Col. Holden, Chief of the Ordnance Department at Woolwich. The tests took place in Hill Mansion Road, Langside, where they were made to run backwards down the steep incline and stop at a given signal. All stopped satisfactorily except a Serpollet steam car, which, owing to the accidental bursting of a tube, was withdrawn; and a light Daimler car in which, owing to the brake acting too suddenly and jamming the gear, the wheels were stripped.

On Sunday the garage presented an active scene—men and masters all being busy. The judges were also continuing their labours, while many of the competitors—the day being

MAP OF ROUTES.

gloriously fine—indulged in spins in various directions. The following "Notices" were placed on the board on Sunday:—

- No. 22. 8 h.p. Humber will not run.
- No. 21. 5 h.p. Humber will carry four instead of two persons.
- No. 32. Teras car will have only four seats, not six.
- No. 8. The second 10 h.p. Wolseley car is withdrawn.
- No. 34. The Progress car is withdrawn.
- No. 2. M. M. Co's. Light Carriage has affixed to it the New York Co.'s tires (P.5.), entered for trial.
- No. 31. Lanchester car withdrawn.
- No. 39. Hollanshire car withdrawn.
- No. 38. Stirling car withdrawn.
- No. 6. Light Daimler car withdrawn.

ANNOUNCEMENT BY THE JUDGES' COMMITTEE.

LATE ARRIVALS OF VEHICLES AT THE STORAGE BUILDING.

Rule 58 provides that competing vehicles should be at the Storage Building, Glasgow, on Friday morning, 30th August, at 10 a.m., and that, otherwise, they may be disqualified.

It will be seen from the list shown hereunder that (a) nineteen vehicles were in the Storage Buildings by 10 a.m. on Friday; (b) seven more vehicles were there by noon on Friday; (c) seven vehicles arrived between noon and 9 p.m. on Friday; (d) eight vehicles had not arrived at 8 a.m. on Saturday morning. It is known that competitors who complied with the regulations would have been glad of the opportunity of delaying, even for a few hours, the departure of their vehicles from their works and that these few hours might have enabled them to put their vehicles into more satisfactory condition than is at present the case. Competitors who delayed departure from their works at such a time as would have enabled them to comply with the regulations have thus an advantage over those competitors who adhered to the regulation. The Judge's Committee have the right to disqualify and forbid the running in the trials of vehicles which arrived in the storage building after ten a.m. on Friday. The Judges' Committee have decided not to make awards in respect of vehicles which arrived after twelve noon on Friday. The Judges' Committee are, however, prepared to consider any representation in writing that may be made by a competitor whose car did not arrive by that hour as to the non-responsibility of the competitor for the failure, but such representation, in addition to stating the cause of detention, must state at what time the car last left the competitor's premises before its arrival in Glasgow, and such statement must be verified.

Arrivals before or at timing, Friday, August 30th, at 10 a.m.:—Cars Nos. 5, 6, 7, 9, 10, 11, 12, 13, 14, 17, 18, 19, 20, 27, 28, 32, A5, A6.

Arrivals by noon on Friday:—Nos. 21, 23, 24, 26, 29, 30, 41.

Later arrivals on Friday:—4 p.m., No. 1; 9 p.m., No. 2; 4 p.m., No. 4; 12.30 p.m., No. 33; 5.40 p.m., No. 35; 6.0 p.m., No. 36; 6.30 p.m., No. A8.

Saturday, after 8 a.m.:—Nos. 3, 15, 25, 31, 37, 39 (withdrawn), 40, 42, 43.

In Section II., not entering for certificates:—A1 arrived at 11.30, p.m. Friday; A2 at 6 p.m.; A7 at 6.30 p.m.; A10 5.40 p.m.; A11 at 8 a.m.

Not arrived by 8 a.m. Saturday:—A3, A4, A9.

SECTION III.

P. 1.—The 12 h.p. Panhard to which Dunlop tires are affixed, had not arrived by 8 a.m. on Saturday.

P. 2.—The M.M.C. No. 3 had not arrived by 8 a.m. on Saturday.

P. 3.—Ignition being fitted on Friday to No. 7.

P. 4.—Ignition fitted to car No. 14, which was up to time.

P. 5.—Tires fitted to car No. 2, which arrived 9 p.m. Friday.

THE INAUGURAL DINNER.

IN connection with the trials an inaugural dinner was held in the Windsor Hotel, Glasgow, on Saturday evening. The Right Hon. Sir J. H. A. Macdonald, Lord Justice-Clerk of Scotland, occupied the chair, and Mr. Norman D. Macdonald, the Chairman of the Scottish Club, Mr. James R. Nisbet, and Mr. Robert J. Smith, C.A., officiated as croupiers. After dinner, the chairman proposed "The King." He said it was a great thing for those connected with the motor-car movement to know that the head of the State took an interest in it and enjoyed the sport. The chairman then gave "The Queen, Duke and Duchess of Cornwall and York, and other members of the Royal Family." He remarked that it was encouraging to those who favoured electric traction to know that the motor-car of the Queen was driven by electricity. He hoped that many ladies would follow her example.

Mr. John H. Gretton proposed "The City of Glasgow," which was acknowledged by Bailie Cleland.

Ex-Bailie Simons proposed "The Trials, Exhibition, the Automobile Club of Great Britain and Ireland, and the Scottish

Automobile Club." With reference to the trials, he remarked that when Mr. Johnson, the secretary of the parent club, came to Glasgow, he naturally came to the speaker as the Chairman of the Sports Committee. It was clear to him that these automobile trials were a desirable thing to have, and that they should do everything possible to further this interesting work. That was the reason why, without any hesitation, the Sports Committee were at once able to arrange for these tests, which he hoped would be of great advantage, and be thoroughly subservient to the objects which the clubs had in view. They could not in this country have those exciting break-neck contests which had been held on the Continent. From a utilitarian aspect he believed the trials of speed and duration would be more conducive to the benefit of the movement than the more exciting ones. He coupled the "Exhibition" with the name of ex-Bailie Shearer, that of the "Automobile Club of Great Britain and Ireland" with Lieutenant-Colonel Holden, and that of the "Scottish Club" with Mr. Norman D. Macdonald.

Ex-Bailie Shearer said their object in the Exhibition was to spread abroad the knowledge of the position that Glasgow and the West of Scotland occupied in the manufacturing, engineering, and other enterprises; and he trusted that those who were interested would recognise that Glasgow was a splendid centre for the new and rising industry of the construction of motor-cars.

Lieutenant-Colonel Holden, in his reply, said that one of the speakers had referred to the growth of electric traction in Glasgow, but he would like to say that electric traction must not

THE PARR 5 H.P. CAR.

grow too fast or take up too much room, else little room would be left for the automobiles. With reference to the action of the War Office in this matter, he would like to say that the War Office had a difficulty in starting that sort of thing. A number of gentlemen came forward and offered their services and their cars to the War Office without any restriction if they would only try them; and several gentlemen had actually gone down to Aldershot with their cars, and had created a most favourable impression. They had started the interest of the military authorities in automobiles. That referred to passenger vehicles; but he was glad to say that the military authorities were about to interest themselves in heavier vehicles; and in that respect the recent trials at Liverpool had been of the greatest value. A committee which was sitting at the War Office attended these trials a few months ago, and, as possibly all knew, specifications were being formulated, and a prize was being offered for lorries mechanically driven, and he trusted that the manufacturers and inventors of this country devoting themselves to this work would be found at the head of every nation. As regarded the Glasgow trials, he believed the tests would do more to spread automobilism in Scotland than the previous trials at Richmond or the 1,000 mile Trial of last year.

Mr. Norman D. Macdonald, in replying for the Scottish Automobile Club, said he could not resist the temptation to give them a hint of what he proposed to say in a paper at the coming meeting of the British Association. He would point out that the citizens of Glasgow had just put down their electric trams at the

very time when it was beginning to dawn upon the public of this country that electric trams would have to be taken up. He was not saying one word against the efforts the Corporation had made in respect to electric traction, or the splendid results that had flowed therefrom; but what he meant was this, that the tram-cars were run on fixed rails in the middle of the streets, and that that was an absurd method of moving traffic. If the streets of Glasgow were filled with automobiles taking the traffic instead

THE M.M.C. VOITURETTE ON THE WEIGHING MACHINE.

of the cars, there would be a much larger traffic at a much greater speed and with more safety.

Mr. T. W. Staplee Firth gave "The Chairman," and spoke of the dogged way in which Lord Kingsburgh had stuck to his faith in the future of the motor car.

The Chairman, in acknowledging the toast, said he did not believe that in Scotland any automobile was ever driven at a rate of more than ten miles an hour. Very few motorists had been prosecuted, for, like canny Scotchmen, they only drove beyond the legal limit when there was nobody looking. (A laugh.) It was quite true in a sense, as had been said to him that day, that very fast running upon roads by cars built for very fast running improved the breed. But they would allow him to suggest that the place where they improve the breed of horses by racing was not upon the public roads. To improve the breed of horses had something to do with blood, but there was no blood whatever—nothing but petrol—in the inside of a motor-car. He would advise his young friends to have a little discretion. It was not wise, in the interests of automobilism, for some of them to tear along as they did—rolling and rumbling and making a fearful noise raising clouds of dust, so that nobody could follow them. Another thing that required to be considered was the want of good feeling that was shown to other people upon the road by some of the automobilists. He had made up his mind that if ever any case in connection with an automobile came up on appeal he should tell his colleagues that he should not sit upon that case. He could not give a righteous judgment, as he was almost sure he would go against the automobilist, as an extreme desire to be conscientious sometimes was the most misleading thing in this world. He would like to make a suggestion to those who were interested in the automobile industry. The people they had to please were not extreme sportsmen; they were the citizens of this country, and they must use all their efforts to produce that which would please the average citizen who did not wish to risk his life every day. If those who were deeply interested in this as a commercial speculation—because all these things had two sides, one a commercial and the other a social—kept these two things before them, he could assure them that in this country there was a vast future

before them. He was quite certain the day was coming when the large sums of money that had been going abroad for the past few years would no longer go there, but that the citizens of this country, when they came to take up automobiles—as they would do—would be able to build and turn out successfully motor-cars which would give satisfaction on the road to the drivers and also give satisfaction to the public who had no motor-cars. The chairman concluded by proposing the health of Mr. Johnson, the secretary, who replied. The company then separated.

THE FIRST DAY.

The first day's trial was from Glasgow to Edinburgh and back, a distance of 116½ miles. Among the forty-one carriages which left Finnieston on the stroke of eight o'clock on Monday morning could be found almost every type—voiturettes, light carriages, six-seated cars, a Century motor-tandem of light construction, wagonettes, and dogcarts. Elaborate and well-devised arrangements had been made for the run. Police were stationed at nearly every city crossing and at every hamlet, regulating the traffic and controlling the crowds that gathered everywhere along the route. No incident occurred in the town procession, the Scotch horses, contrary to the expectations of the English visitors, being in no way frightened. Many cars joined unofficially in the run. The Rt. Hon. Sir J. H. A. Macdonald, who is president of the Scottish Automobile Club, in his elegant Delahaye, travelled over the course. After passing through the city at a moderate pace, they drew up at the third milestone east of Glasgow, and thence proceeded on their way at minute intervals. During the run the order of procession was repeatedly altered, cars dropping out through tire punctures and other causes. All along the route the automobiles were regarded with wonder and, in many cases, with enthusiasm. Edinburgh was reached two hours twenty-eight minutes from the Glasgow control, the New Orleans (No. 16) making St. Andrew Square at 11.2 a.m., and most of the vehicles had lined up before 11.30. After luncheon at the Royal Hotel the automobilists proceeded on the return journey by Straiton, West Linton, Biggar, Lanark, and Hamilton, joining the outward track at Uddingston. On the moor country a fair rate of speed was maintained, notwithstanding the steep gradients. The famous Lanark brae offered an unequalled opportunity for testing the brake power of the machines. All came down the sudden turnings of the road with ease and safety. Seen from a distance it was a most extraordinary sight as the sun shone on

IN THE "GARAGE" IN KELVINHAUGH STREET, GLASGOW.

the long *queue* of cars that seemed to crawl like flies on the spaces of the inclines. At Lanark and Hamilton the streets on either side were lined with spectators. First to arrive at the milestone which marked the Glasgow control was the 9 h.p. Napier car, driven by Mr. C. Edge. The Hon. C. S. Rolls's 16 h.p. Panhard's machine, however, was first to arrive at the Exhibition, passing Queen's Gate at 4.57 p.m.

Other cars were in hot pursuit, and formed into line as they arrived. At half-past eight there was only one vehicle to come in, and an hour later the muster was complete. With lamps blazing strongly and having on board many ladies, the cars paraded through the Exhibition grounds, and so successfully ended the first day of the trials. The M.M.C. voiturette No. 1 (single cylinder voiturette) on Monday carried Mr. Shrapnell Smith as observer, and had as passengers a representative of *The Glasgow Herald* and a mechanic. The runs, both out and home were absolutely non-stop and close to the official minimum times. The car led the procession from the Tramway Stables to the outward control in Glasgow, and reached Edinburgh seventh. The "Auto-sparker" was not tested this day. The marks for the run were awarded as follow:—

SECTION 1—MANUFACTURERS' VEHICLES.

Class A.—No. 1, Motor Manufacturing Company's 6 h.p. voiturette; No. 16, New Orleans 7 h.p.; No. 28, Hozier Engineering Company's Argyll voiturette; No. 30, De Dion-Bouton 4½ h.p. voiturette—300 each; No. 9, Wolseley Tool and Motor-car Company's 5 h.p. Wolseley—298; No. 12, Roadway Autocar Company's 4½ h.p. Renault; No. 37, Stirling's Motor Carriage Company's 4½ h.p. Stirling Parisian phaeton—295 each; No. 33, Century tandem—280; No. 20, Locomobile steam car—253; No. 29, Parr and Co.'s 5 h.p. carriage—251.

Class B.—No. 2, Motor Manufacturing Company's 6 h.p. two-cylinder light carriage; No. 5, Daimler Motor Company's 6 h.p. light car; No. 36, Mo-Car Syndicate's 7 h.p. Arrol-Johnston dogcart—300 each. No. 41, Enfield Cycle Company's 6 h.p. Royal Enfield—299; No. 11, Roadway Autocar Company's 6 h.p. Mors—288.

Class C.—No. 3, Motor Manufacturing Company's six-seated car; No. 18, Auto-Carriage Company's 10 h.p. Bardon; No. 35, Mo-Car Syndicate's 8 h.p. Arrol-Johnston six-seated car—300 each; No. 26, Panhard and Levassor's 7 h.p. light Panhard—287.

Class D. No. 13, Roadway Autocar Company's 10 h.p. Mors; No. 14, Geo. F. Milnes and Co.'s C.P.C. car; No. 23, Motor Power Company's 9 h.p. Napier—300 each; No. 32, W. T. and S. E. Botwood's 14 h.p. "Teras" (Gobron-Brillié)—293; No. 7, Daimler Motor Company's 18 h.p. Daimler—292.

SECTION 2.—PRIVATELY-OWNED VEHICLES.

No. 3, 16 h.p. Panhard, owned by the Hon. C. S. Rolls; No. 7, 12 h.p. Daimler, owned by Mr. J. D. Siddeley; No. 8, 7 h.p. light Panhard, owned by Mr. Harvey Du Cros, jun.; No. 11, 7 h.p. New Orleans Company's, owned by Mr. William Exe—300 each; No. 10, Arrol-Johnston, owned by Mr. R. A. Whytlaw, jun.—285; 7½ h.p. Albion car, owned by Mr. Walter Creber—284.

Appended are accounts of the performances of several of the cars, prepared either by the observers or passengers on the same.

ON THE M.M. CO.'S CAR, "No. 3."

A bright and glorious morning, with just the degree of mist hovering round, which in Scotland at this time of the year gives promise of a fine day, and an ideal day it turned out, though the motorists would have preferred less dust in some parts of the route. The first cars to move away from the storage premises were within a minute from the official time of departure; unfortunately, the car on which I was placed had only arrived from the works late on the previous night by train and had not previously been run, so what with making minor adjustments, filling up with petrol, and waiting for a late passenger, it was 8.10 a.m., or ten minutes late, before we got away, and but few cars remained behind. Our car carried six in all, and though of but 7 h.p., very soon showed signs of a capacity for moving which promised to make up such of the lost time as the regulations permitted.

On the journey to the outward control nothing of interest was observed; the Glasgow "setts," or paving-stones, are proverbially bad, and on our car being shod with solid tires, and heavily laden, we felt the effect somewhat. Five late starters drew up at the control two minutes after we arrived, and in leaving the control we had Mr. Rolls' 16 h.p. Panhard (A3) as our

pilot. From Glasgow to Holytown (9½ miles), on a choppy road, nothing more important than a little passing and repassing occurred. The first car we passed was Mr. Burns' 6 h.p. Daimler wagonette (A5), swerving badly, then one of the late entry Stars. Just after taking the turn for Holytown, Mr. Manville's 12 h.p. Daimler (A9), in company with another Daimler, was observed to be in trouble, apparently from the circulation pump. Two miles further we overtook the 5 h.p. Humber (No. 21), going very slow, and very soon after this found the 18 h.p. Daimler (No. 7), entered by the Daimler Company, pulled up for repairs evidently connected with the tires. Then in turn we passed an Albion car (A6), and the British and Foreign electrical car (No. 40), which was stopped for some reason or other. The next car overtaken was the 6 h.p. Mors (No. 11), following close on which both the Locomobiles (Nos. 19 and 20) were pulled up together for water.

Yet two more cars were destined to fall behind us ere Bathgate was reached, these being the two Arrol-Johnston cars of 7 and 8 h.p. respectively (Nos. 35 and 36). The only companions we had on this stretch were Mr. Exe's New Orleans (A11) and the Star, both of which kept pace for a considerable distance.

Between Bathgate and Edinburgh (16½ miles) we first caught up with the Royal Enfield voiturette (No. 41), and immediately after came across one of the three Wolseleys involved in tire complications. The next car passed was 4½ h.p. Stirling (No. 37), which had been in sight some time and was going very well. At the Edinburgh control our own car was close on minimum time, our nearest attendants being the Star, Enfield, and Stirling, all three cars having gone well for some time. The bulk of the first arrivals were away from Edinburgh at the earliest moment possible after the expiration of luncheon time, our car being somewhat late in starting. But little of interest occurred for some time, though we passed a few of the smaller powered cars. After the climb out of Edinburgh the view was magnificent, and the roads continued to improve to the next stage at Biggar, twenty-eight miles from Edinburgh control.

Biggar to Lanark and thence to Hamilton (twenty-four miles) proved the tit-bit of the run in the way of scenery and diversity of view. The road is undulating but smooth, with some steep hills, notably the one after Lanark. Beyond passing a 7 h.p. light Panhard with inner tube of tire out, a 7 h.p. New Orleans, also stopped on account of tires, and a Renault car stopped for some other reason, we saw nothing of any others. The rest of the journey was uneventful, no car being sighted except the M.M.C. voiturette (No. 1) as we passed through Hamilton. At the inward control to Glasgow, and near to the Exhibition, however, the New Orleans and the M.M.C. (No. 1) caught us, through traffic obstruction, and we entered the Exhibition grounds together.

The M.M.Co.'s car on which I travelled made no stop but the compulsory one at Edinburgh and at the controls until we got blocked with traffic in Glasgow on the return journey. Although the vibration from the solid tires was at times unpleasant, the running of the car was an unqualified success by reason of the fact that it did all asked of it, and, whilst fulfilling the Club's conditions, took its load of six persons from place to place without fault or failure in accordance to order.

T. H. H.

ON THE "C.P.C." CAR.

I was somewhat late in my application for a seat for the week's drives, but I thought that chance had favoured me more than I deserved when I saw to what cars I had been allotted on the various days. On Monday I was accommodated upon one of the Marienfelde cars of Messrs. Milnes and Co. As I had seen it, and several like it, before the coachwork was added, and had therefore had an opportunity of examining the construction of usually hidden parts, I was much interested in seeing how it turned out. The difficulty of writing any account of the day's experiences is that there were no incidents of a mechanical nature, and that the programme arranged by the Club admitted nothing more than a cursory view of the country traversed. We were among the last to get off in the morning, owing to our position in the stables. However, the engine started up

with a couple of turns of the handle, and ran all through as well as she started. She proved herself quick in picking up after a stop; the magnetic ignition was efficient, so was the cooling, although the slight leak which I noticed might become a nuisance with so little water carried. The speed-changing seemed a bit difficult at times, and the second gear was not so silent as the others. So much for the car. The road in the outward direction seemed to me considerably more bumpy than I remember its being years ago, but that was from the cyclist's point of view, and I believe that the automobilist is more dependent upon the quality of his road than the cyclist, though the contrary might be supposed. It is difficult not to compare Edinburgh with Glasgow, when one sees them both in one morning. Nature has, of course, done very much for the eastern city, but I do think man has done almost his worst for the western.

We had a tire down soon after starting after lunch. We were not going particularly fast, but internal warmth loosened an old patch. French chalk, as an observer reminded us, keeps tubes from heating as well as from sticking; only you must have plenty of it, as much as the cover will hold when the tube is in place. The observer said the rule was that no passenger might lend a hand; I thought it a very beneficent rule myself at the time. However, our friends got a new tube in without any difficulty. After that we did not halt till we reached the Exhibition grounds. We managed the Lanark hill all right—it is certainly a nasty one. Most of the cars appeared to be going faster in the stage following this than at any previous point, owing, perhaps, to two or three of the more powerful machines happening to get together at this point. The road was on the descent and very tortuous, and the clouds of dust impenetrable. It made quite an exciting bit. One can't have everything, but it seemed a pity to go past the Falls of Clyde and Hamilton Palace without stopping. Throughout the run people were most kindly, and greeted the cars as they went by. The police did their duty with the best of humour. One constable who was taking numbers and notes told me it was done for the use of the press.

ARUNDEL WHATTON.

MR. MANVILLE'S 12 H.P. DAIMLER (A9).

Mr. and Mrs. Manville and a servant arrived on their 12 h.p. Daimler at Glasgow on Saturday afternoon, after having had a run of about 800 miles, an experience which Mrs. Manville described as embracing some of the finest scenery in England, Scotland, and Wales. Notwithstanding this long journey and the short time which elapsed between their arrival and the commencement of the trials, Mr. and Mrs. Manville were all ready for the first day's run, and were amongst the first arrivals at the official starting place. Mr. Staplee Firth was the judges' observer on this car for this particular day. The car arrived at the outward control at Glasgow in the ordinary course, but before the first twenty miles had been reached there were unmistakable signs of trouble. The engines had become so hot that the outer covering of one of the sparking plug wires fired. A stop was inevitable. The mischief was difficult to discover, and the difficulty was increased by several friends who were experts giving advice which proved to be incorrect. It had been discovered at an early part of the investigation—as is evident from the foregoing—that the water circulation was defective. Ultimately Mr. Manville, acting on his own impulse, attacked the pump, and it was found that the small set pin which holds the bottom valve in the pump in position had disappeared. The result was that the water was draining away at the lowest point, and that the dislocation of the valve made it impossible for the water to circulate. The pump was detached, and a search was made for anything in the shape of an engineer's shop, but the best apology for one that could be found was the village blacksmith, by whose help a small shouldered pin was shaped from a rough piece of iron. The pump was replaced, and very soon the car was speeding on its way to Edinburgh, a distance of some thirty-eight miles, after a delay of 2½ hours. We understand that the performance of the car throughout Monday's run, with the exception of the mischief caused by a single piece of defective iron, was highly satisfactory, and gave great pleasure to its occupants.

ON THE 7 H.P. LIGHT PANHARD, No. 26.

On Monday I was acting as observer on the 7 h.p. light Panhard, which was driven by Mr. C. Jarrott. Having made my way to the stable and found the car, we took our place in the procession, and left for the Outward Control. During the run through the traffic Mr. Jarrott showed how perfectly this car can be managed, as in a procession of motor-vehicles, keeping close together and considering the space taken up by the electric trams, the car has to be under perfect control. Or if the car in front has to pull up suddenly you are into it without the slightest warning. The car in front ran into the back of the one before that, and our car was pulled up immediately. The points in the car which struck me most were the magnificent brake power, a test of which we had on Lanark Hill, the swiftness of running such a light car with so powerful an engine, and the hill-climbing powers. In the course of our run we had only one trouble with the motor, the pipe to supply petrol to the carburettor getting stopped up; this was remedied in a very short time, and our other stop was caused by a puncture.

ON THE 9 H.P. NAPIER, No. 23.

This car, the production of the well-known firm of Messrs. D. Napier and Sons, of Lambeth, is generally of their standard design, developing 11½ h.p. on the brake. There are, however, a few detail improvements over those previously turned out, the principal one being that of governing the engine by throttling the mixture and obtaining an impulse every cycle instead of reducing the number of impulses as originally. The gearing is also an improvement on earlier designs, in that one lever suffices for the four speeds forward and one reverse. The car had of course no opportunity of showing its true form until well outside the Glasgow control, but after waiting eight minutes at this point for other cars to start at regular intervals, immediately settled down to its work at a steady pace fully up to the legal limit. The villages through which we passed appeared in all cases to be holiday making, the streets being lined on both sides; between which a passage was excellently kept by the local police, who heartily entered into the spirit of the trials and rendered all assistance in their power. The latter appeared to be in all cases provided with bicycles, so that one has to be careful of speed in these parts.

Our car was now beginning to exhibit its superior qualities by the methodical way in which it gradually forged ahead, and rapidly bettered its position in the procession, as after a most enjoyable but uneventful non-stop run we eventually ran into Edinburgh third, thus having bettered our position by about nine places. We here took up our position in St. Andrew's Square, where the cars were critically inspected by many enthusiasts, and it was a matter of some difficulty to get to one's car when the time came for our return journey. The attention required during the luncheon interval consisted solely in lubrication and a little water for cooling. We started out at 12.45 after lunch in the same position in the queue of cars as we had entered the inward control, and were ably directed to the outward control by the police, who kept an excellent course. After reaching the outskirts of the city our pace was again regular, and the two cars which started in front of us were soon passed. We were now travelling in fine style through most beautiful scenery, the sun shining on the heather-covered mountains in the background, giving an exceptionally fine effect. The roads throughout were very hard and smooth, but unfortunately a little dry, thus causing considerable dust.

Judging by the experiences of others, the roads must have been very plentifully strewn with nails and other enemies to tires, but we were exceptionally fortunate in getting right through without troubles of this description. Sundry cattle and sheep were met with which did not appear to relish our approach and necessitated a few "slows" to enable them to get off the road. After examining our brakes and successfully negotiating the corkscrew hill into Lanark, we followed the Clyde for some miles, country mansions dotted about on its banks adding considerably to its beauty. The run home into Glasgow was as

enjoyable and successful as the outward trip, and we finally ran into the Exhibition grounds, after having secured premier place, without any adjustment of the smallest description being necessary, the latter reflecting much credit on the makers, considering that the car had only run 100 miles before the trials.

R. H. S.

THE SECOND DAY.

There was little wind, the dust was not troublesome, and the rain which threatened in the morning kept off all day. The days programme was a run to Ayr and back, via Renfrew, Port-Glasgow, Stevanston, and Monckton. Although differently composed, the procession, which left Kelvinhaugh Street at eight on Tuesday morning, again numbered forty-one vehicles. There was a larger proportion of ladies among the travellers than on the previous day. The Glasgow control ended at the Govan tramway terminus, and here the cars pulled up. Three of them had already damaged their chances by involuntary stops within the first few miles. Control was cleared about nine o'clock. Full advantage was taken of long, smooth tracts in this district, and here the speed limit was at once touched by most of the cars. The Inchinnan Bridge over the river Cart was safely negotiated, and soon the head of the procession was more seriously tried by the narrow, awkward streets of Port-Glasgow. Punctures were more plentiful on this route, and several cars were in difficulties between here and Largs. First to pass into the Ayr control was the Hon. C. S. Rolls's 16 h.p. Panhard, which crossed the bridge at 12.18, closely followed by other cars, the last arriving about half-past two. The breakdown of two vehicles was reported here, and those in charge of the powerful 18 h.p. Daimler were stated to have been forced to seek assistance owing to a tube defect. Many fine performances were recorded on the uphill run to Fenwick, and once on the smooth down track every car was put on the full speed permitted by the rules. The Hon. Mr. Rolls's Panhard maintained its advantage, and first reached the Glasgow control. Two minutes later P. 1, a 12 h.p. Panhard car entered by the Dunlop Company for tire trials, came in. Unfortunately, Mr. Rolls's car broke down in the street and could not be driven further, so the honour of first entering the Exhibition lay with the Panhard car. At 8.15 thirty-seven vehicles were in the grounds. Good performances were plentiful. In the section composed of cars declared at a selling price of more than £500 four out of the five machines entered earned full marks.

The marks for the day's run were awarded as follows:—
Section I.—Manufacturers' vehicles—Class A.—No. 12, Roadway Autocar Company's 4½ h.p. Renault; No. 16, 7 h.p. New Orleans; No. 28, Hozier Engineering Company's Argyle voiturette; No. 30, 4½ h.p. De Dion voiturette; No. 37, 4½ h.p. Stirling Parisian phaeton—300 each. No. 1, Motor Manufacturing Company's 6 h.p. voiturette; and No. 27, Motor Car Company's 5 h.p. Decauville voiturette—297 each. No. 9, 5 h.p. Wolseley, 294; No. 19, Locomobile steam car, 278; No. 20, Locomobile steam car, 265; No. 33, Century tandem, 260; No. 24, Clarkson and Capel 5 h.p. light steam carriage, 258.

Class B.—No. 11, Roadway Autocar Company's 6 h.p. Mors, 297; No. 36, 7 h.p. Arrol-Johnston dog-cart, 292.

Class C.—No. 2, Motor Manufacturing Company's 6 h.p. two-cylindrical light carriage; No. 10, 10 h.p. Wolseley; No. 35, 8 h.p. Arrol-Johnston 6-seated car—300 each. No. 26, 7 h.p. light Panhard, 297; No. 3, Motor Manufacturing Company's 6-seated car, 293; No. 18, Auto-Carriage Company's 10 h.p. Bardon, 275.

Class D.—No. 13, Roadway Autocar Company's 10 h.p. Mors; No. 14, George F. Milnes and Co.'s C.P.C. car; No. 15, the same manufacturers' C.P.C. car; No. 23, 9 h.p. Napier—300 each; 18 h.p. Daimler—133.

Class F.—No. 4, Motor Manufacturing Company's 1-ton van, 6 h.p., 107½ miles in 9½ hours.

Class G.—No. 40, British and Foreign Electrical Vehicle Company's car, 69 miles on one charge, with no stop.

SECTION II.—PRIVATELY OWNED VEHICLES.

No. A 5, No. A 6, No. A 7, No. A 8—300 each; No. A 11, 7 h.p. New Orleans—297.

SECTION III.—PARTS OF MOTOR-VEHICLES ENTERED BY MANUFACTURERS.

No. 1, Class B (tires), Dunlop Pneumatic Tyre Company's set of Dunlop tires affixed to a 12 h.p. Panhard car; No. 5, New York Tyre Company, a set of tires affixed to an M.M. Company's voiturette—300 each; No. 4, Class G (ignition devices), Simms-Bosch magneto-electric ignition and interrupting timing gear, entered by the Simms Manufacturing Company, affixed to vehicles 14 and 15—300.

ON THE "C.P.C." CAR.

The route to-day was over one of the finest stretches in the country, embracing delightful scenery and well-nigh perfect road surface for the bulk of the journey. In consequence of the compulsory retirement of some of the vehicles some little difficulty was experienced in rearranging seats, and a few late comers were unable to find a "mount." The Humber voiturette on which I was to have travelled was unable to start through some slight trouble, and at the last moment I was offered a seat on one of the two Geo. F. Milnes Company's C.P.C. cars, two of which were running in the trials; and in this I was particularly fortunate, for I found myself on one of the finest and fastest cars engaged. The start was a punctual one, and we left the storage building about tenth in order of procession. The first thing to be noted was the difference in running over the Glasgow paving when mounted on pneumatic tires as compared to the solids of the day before, and the outward control to-day was a fairly long one—five and a quarter miles. Proceeding through Renfrew and Bishopton, and so on to Greenock and Gourrock, the road offering no opportunities for "getting away," chief interest was centered in the mingled wonder and enthusiasm of the dense crowds of spectators lining the streets, particularly at Greenock, for the men were just returning from breakfast. After getting clear of the trams at Gourrock (27½ miles from start), the open country was reached, and a glorious panorama was unfolded with every bend in the road. The Clyde-side resorts at the opposite side of the water stood out clearly, and Ben Lomond in the background was now visible, but the morning was distinctly dull with promise of rain. Great enthusiasm on the part of the people continued to be displayed all along the road through Wemyss Bay, Fairlie, and other Clyde-side resorts, and up to Kilwinning nothing of any importance had come under observation.

The section D to E on the programme, from Gourrock to Ayr control, (40½ miles), offered fine opportunities for scorching, practically the whole of this distance being a smooth, well-kept road, with lovely views on the right. On leaving Gourrock we passed a cluster of small voiturettes all going fairly well, and soon after overtook one of the Daimlers with Mr. Critchley on board, going very badly, while further on the Motor Manufacturing Company's voiturette was seen pulled up for repairs. Meanwhile our own car was behaving grandly, the engine working with that peculiar, smooth, humming sound which denotes perfection of working, and on the top speed the silence of the car was remarkable, practically nothing of the exhaust being heard, and whenever our "official observer" gave us permission to "go on" it was clear that the car could answer. Indeed, with respect to most of the cars as well as the one I was on, it was a case on this journey of being held back by legal restrictions and the Automobile Club's regulations for the trial; in fact, the cars which escaped misfortune were controlled to run on time to a nicety, our own car completing the various timing sections with greater regularity than most express trains, for it was seldom we were more than half a minute away from official time. On the 40½-mile run from Gourrock to Ayr control the pace of the car was regulated to such a nicety that at each half hour the required milestone was in sight, and at the end of this non-stop run the watches showed us as ten seconds away from time. The only cars in trouble which were passed by us on this stretch were Mr. Cordingley's 10-h.p. Napier and the Royal Enfield voiturette; Mr. Harvey du Cros's Panhard was also stopped, though nothing in the way of repairs seemed to be going on.

The arrival at Ayr was very uniform as far as the "first flight" cars were concerned, but the long forty-mile run had eliminated many of the under-powered smaller vehicles, and after making a stay of over an hour at Ayr for luncheon, we met several of these only just arriving, the following amongst others: Mr. Exe's New Orleans, which had run so well on Monday; the two Arrol-Johnston motor-cars; a Locomobile; the Century tandem; and the smaller Bardon. The run back was uneventful so far as our immediate surroundings were concerned, our nearest attendants being the De Dion voiturette and the little Stirling, which had done so well on the first day. The order of arrival at the Exhibition should have made our car third in rank, but the actual order of the cars as drawn up for inspection placed the three Panhards first. At 3.50 a cluster of six cars arrived, after which there was a long interval, and some fifteen were very late for some reason or other. T. H. H.

ON THE "POWERFUL" ELECTRIC-CAR.

On the first day of the trials, namely, Monday, the car ran to Edinburgh, where the battery was charged for four hours at the Heriot-Watt College, by the courtesy of Professor Francis E. Baily, and returned to Glasgow in the evening, doing a total of 100 miles or more. On Tuesday, at a distance of about thirty-five miles along the route, the driver declared his intention of returning to Glasgow, and the car reached the Exhibition at 4.15 p.m., having covered seventy miles at an average speed of twelve miles an hour throughout the journey. The voiturette at the start on Tuesday registered 104 volts, and at the finish 96.

THE THIRD DAY.

Wednesday's run was to Callander and back *via* Torrance, Fintry, and Thornhill—a distance of 99½ miles. The route was a hilly one, and advantage was taken of this to hold a hill-climbing competition up Fintry Hill—a rise of 843 feet in three miles, equal to an average gradient of 1 in 19.1. Thirty-four cars started from Glasgow, the morning being cold, with some rain. The hill-climb was taken by the majority of vehicles in good style. A stop was made at Callander for lunch, and in the afternoon the weather improved. The first car got back to the Exhibition at Glasgow at a quarter past three, while the others were all in by half past six. Notwithstanding bad roads, the day's results were very satisfactory.

THE OSTEND RACE MEETING.

(From Our Own Correspondent.)

OSTEND, Monday, 9.30 p.m.

AUTOMOBILES are not very much *en evidence* here," was our reflection at the end of last week, and the villainous *pace* which forms so much of the available highway in Belgium seemed enough to account for it, though we were rather surprised at so few cars being visible. But the last day or two has altered the state of affairs, and many of the competitors and their friends have already arrived, though the foreign contingent are yet to come, many being probably still on their way from Deauville. While looking out for the arrivals at Sluyter's garage (with many false alarms owing to the habit of carrying horns being prevalent with rubber-tired carriages, to say nothing of cyclists and the numerous steam trams) the unmistakable sound of the exhaust announced the arrival of a racer, which proved to be M. Brulé's Mercedes, with a broken *chassis* due to the rough roads. Jenatzky had already arrived, but no news was to hand of M. Serpollet, who had started, with Mme. Serpollet, for Ostend by road after his success at Deauville, and much interest was expressed in the chances of Messrs Mayhew and Edge putting in an appearance.

A visit to the track on Sunday, when it was the scene of some trotting races, did not suggest the prospect of records being broken, it being of grass, and though 2½ kilomètres in circumference, somewhat sharply curved for automobile speeds. Being inclosed, however, there is no likelihood of sport being spoilt, as at Deauville, by the encroachment of spectators on the course. Rivierre is also among the arrivals, and another victim of the bad roads, the frame of his Mors having broken in somewhat the same manner as Brulé's, necessitating a patch up, by the way, with wooden blocks. M. Sluyter's surmise that the state of the high-

ways might account for many of the absentees may prove only too correct; it is, however, consoling to learn that a sum of five million francs has been voted for their improvement, though the results cannot be expected for a couple of years.

Tuesday, 8 p.m.

The weather, which had been doubtfully inclined, proved propitious for to-day's races, though a fresh north-east breeze, blowing down the 1,000-mètre straight, was evidently felt by the lighter cars. A large attendance showed the interest taken in the events, and the paddock was filled with a fashionable crowd, the greatest interest, in the lamented absence of the Napiers, being perhaps aroused by Truffault's curious 12 h.p. voiturette, a vehicle resembling the Pennington war chariot more than anything, with its front wheels in forks, and the driver's seat consisting of a pneumatic cushion on a bracket at the extreme rear, the intermediate frame, with two-cylinder engine in the centre, being a complex framework of tubes, with no trace of carriage-work about it. It proved, however, out of the running against the more legitimate voiturettes, being no doubt handicapped by the roughness of the turf, which must have been a severe ordeal to all the vehicles concerned. The first event, a cycle race of 16 kilos. 200 m. (six laps), was a ding-dong struggle between Gasté and Demester, won by the former in 16 min. 3.5 sec., by 15 sec. from the latter, followed—*longo intervallo*—by Bucquet on a Werner bicycle, two local men who also started having fallen out at an early stage. The next, a race of 27 kilos. (10 laps), for cars under 650 kilos., brought out a large field, including Ribeyrolles (20 h.p.), Baras (20 h.p.), Théry (16 h.p. Decauville), Page (16 h.p.), Olliver (6 h.p. Serpollet), S. Luc (De Dion voiturette), Jules Fischer (12 h.p. Vivinus), Truffault (12 h.p.), Darracq (12 h.p. Darracq), Deschamps (12 h.p. Deschamps), L. Nannarf (5 h.p. Fabrique Nationale), Sluyters (ditto), Debueger (4½ h.p.), France (6 h.p. Mors), Houzoul (3½ h.p. Pieper), De Beukelaere (5 h.p. Fabrique Nationale), and Demester. Owing to the large number of competitors this was run in heats, the winners being—first heat—Darracq, Olliver, and Nannarf; much cheering being elicited by the steady plodding of the latter's 5 h.p. car, which secured third place against many of the flyers that were put *hors de combat* by the rough course. Second heat—Deschamps, Page, Fischer, Demester. The final was a good race between Darracq and Deschamps, won by the former in 26 min. 57 sec. In the race for cars over 650 kilos. (distance 40½ kilomètres, 15 laps), M. Serpollet (12 h.p.), D'Aubrey (12 h.p. Pieper), Baron de T'Serclaes (Bolidé), Baron de Crawhez (20 h.p. Panhard), A. Brull ("Naughty Girl" Daimler (sic), which proved to be a Mercedes), and Baron de Caters (24 h.p. Mors), were the competitors. Serpollet was slow in getting off, while Crawhez and De Caters, with Brull, started at a good pace. After several laps De Caters got the lead, and kept it till the finish; while the Bolidé succeeded in passing Crawhez, and the "Naughty Girl" had to stop a lap from home with valve trouble. The final times were:—De Caters, 45 min. 13.5 sec.; de T'Serclaes, 49 min. 13.2.5 sec.; and De Crawhez, 56 min. 43.3.5 sec.

De Crawhez had been delayed by a stoppage at the tenth lap, while Serpollet had to fall out at the fourteenth lap, after one or two stoppages and re-starts.

WHILE Mr. Anderson and party were motoring in Ayrshire near the foot of Dalvennan Brae one of the steering wheels came in contact with a loose stone, which caused the car to swerve and take the steering handle out of Mr. Anderson's hand, with the result that the car was upset and the occupants thrown on the road. One of the ladies had her arm fractured, and the other occupants were more or less bruised. No damage was done to the car.

THE United Motor Industries, Limited, understand that a firm in Yorkshire are selling a lubricating oil in bulk purporting to be "D" lubricating oil. They ask us to warn motorists against buying any oil in bulk under the name of "D" lubricating oil as genuine. "D" lubricating oil as sold by them is supplied to the public and to agents in tins only, containing one litre, two litres, and five litres respectively, and bearing the name and London address of the firm.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE question of a motodrome still agitates the minds of Parisian automobilists, and longing eyes have been cast upon one of the race courses, which, amongst other advantages, possesses the essential of being close to the gates of the Capitol. The realisation of the project depends entirely upon the willingness of the owner of the chosen site to come to terms with the promoters of the scheme.

M. TAUPAT, who since severing his connection with the Dietrich company has been in charge of a mission to the French Soudan, with the object of establishing an automobile transport in that country, writes from Madagascar, where he is as enthusiastic an automobilist as ever. There is already a strong automobile movement in the island, there being at present fourteen motor-cars, five motor-tricycles and quads, and two motor-bicycles.

MILITARY automobilism is the order of the day, even in Switzerland. In the general orders for the autumn manoeuvres, August 4th to September 20th, instructions are given for the employment of five cars. Three of these are detailed for staff purposes, one wagon capable of carrying 1,000 kilogrammes will be attached to the 3rd battalion of Carabiniers, and another, with a capacity of 2,000 kilogrammes, is placed at the disposal of the transport corps.

It is not generally known that M. Santos-Dumont, who has so far come nearest to winning the Deutsch prize of 100,000f., has himself offered a prize of 4,000f. According to the conditions of the Deutsch prize, M. Dumont drew as a reward for his work in aerial navigation last year a year's interest on the principal, amounting to 4,000f. This sum he has placed at the disposal of the Aéro Club for the foundation of a prize bearing his name, to be awarded to any member of the Aéro Club who, between May 1st and October 31st, 1901, will start from the club ground at Saint-Cloud, travel round the Eiffel Tower, and return to the point of departure (at the end of any time whatever) without having touched the earth, and solely by such means as he may have on board his air-ship or balloon. If the prize is not gained during 1901, it remains open till the solution of the problem. The prize cannot be won by its founder nor by any competitor using a balloon or air-ship designed by M. Santos-Dumont.

THE accident at Lisieux, in the north-west of France, is causing serious injury to the automobile movement, and threatens to bring most drastic restrictions into force. An unknown automobilist ran over and killed an unfortunate employee of the Octroi at Lisieux and escaped at full speed, leaving the man dead on the road; and in spite of the searching, not only of the police, but of the public and of all right-minded automobilists, no clue can be ascertained as to the identity of the perpetrator of this foul deed. The General Council of Calvados is recommending a law to prevent any firm making motor-cars capable of travelling more than eighteen miles per hour, and also requiring the greatest possible speed of all existing cars to be reduced to the same figure. A Press campaign is also going forward on this subject. No amount of law-making will, however, prevent a ruffian from committing a crime, and it is to be sincerely hoped that more reasonable counsel will prevail and that the author of the trouble will be discovered and punished as he deserves.

THE echoes of the great Paris-Berlin race continue to reverberate. The latest echo is the question of Jenatzy and his *voiture mixte*. Jenatzy has been suspended by the A.C.F. for attempting to run in the race without having paid his entrance money or being regularly *poinçonné*. It seems, however, that there is another explanation to his conduct, and Jenatzy has lodged a protest against a decision which, he says, was taken in his absence and without him being asked to give an explanation. Jenatzy further says that, having entered for the race and

deposited, as was required, a sum of money in the hands of the A. C. B., he put his regulation number on his car and started for Paris, but, unfortunately, he had a broken spring, and arrived at Paris too late. His way back to Belgium lay over part of the same route which was gone over by the competing cars. He forgot to take off his number, but informed the controls as he passed that he was not competing. This is Jenatzy's explanation, and the matter stands in abeyance for the present.

THE meeting at Deauville was a victory for steam, and M. Leon Serpollet's friends will all be glad to see him coming to the front again after his misfortunes in the Paris-Berlin race. Strange to say, his little 6 h.p. car beat the 12 h.p. and got the record. The most remarkable performance was that of Osmont, on a 9 h.p. De Dion tricycle, who lowered the petrol record for the kilomètre *lancé* by one second, though he still leaves Béconnais holding the record of the mile. The course was hardly long enough, the road not good enough, and the weather was dull and cold. Mr. F. Edge had two cars entered—a 16 h.p. and a 60 h.p.—but scratched them both.

EVERY day unearths some new experimenter with flying machines as yet unknown to fame. Lyons can now boast of one, a M. Pomperen-Piraud, a maker of models used by painters and sculptors. For years he has been studying the anatomy of the bird, and trying to imitate it in the light materials which he uses for his own business. His object was to make a flying machine with wings articulated like a bird's, but he has given up this plan as impracticable, and is now substituting fans.

RUMOUR has it that Mr. Maurice Farman is about to begin the construction of a flying machine in combination with the Prince of Arenberg, who is supplying the sinews of war. The readers of this journal will remember that I mentioned last week Mr. Farman's balloon ascent. The descent took place under very exciting circumstances, in the middle of a thunderstorm, and the aeronauts were dragged some distance along the ground. Fortunately nobody was much the worse for the experience. It seems that shortly after going up it began to thunder, and, notwithstanding the fact that the valve was opened many times, the balloon was drawn up into the thunder clouds to a height of 1,100 metres. It was soon decided that they must come to earth again, but as the storm was then at its height there was considerable difficulty in getting safely anchored, and in the bumps over the ground, ballast, instruments, provisions, and everything else was thrown out. Mr. Farman, in telling the story to the *Auto-Vélo*, finished by a word of advice to all aeronauts—"On hearing the first thunderclap, come down at once if you don't want to risk your life."

MR. SANTOS DUMONT is ready for another aerial journey. It is just three weeks since his accident, and in the three weeks much has been done. Apart from a few unimportant details, such as a summons from the proprietor of the house where he came down and where he broke a few paltry slates, for which the proprietor was not even polite enough to request payment, the flying machine No. 6 is ready. The stroke of the engine has been lengthened, water cooling has been added, a new balloon has been constructed, the entrance fee for the Deutsch prize has been paid, and now any day—perhaps whilst these words are at the printer's—the world may hear that the plucky Brazilian has rounded the Eiffel Tower and won the prize.

THERE is even the possibility of a collision in the air between two flying machines, for M. Rose has paid his entrance fee also, and purified his hydrogen. He, too, is ready, and expects daily to make his trial ascent. I do not think, however, that M. Santos Dumont has much to fear in this direction. It would indeed be marvellous if an inexperienced aeronaut in an untried machine wrested the coveted prize from the man who has built already six air-ships, five of which have been more or less successful.

THE MILE SPEED CONTESTS AT DEAUVILLE.

A GOOD deal of interest was taken out of the mile speed contests at the meeting at Deauville on Sunday last by reason of the bad weather. The first event was for motor-bicycles (pedalling). There were nine entries in this class, including one lady. The result was as follows:—Cissac (on Chapelle bicycle), 1 min. 48 3-5 sec.; Bucquet (Werner), 1 min. 55 sec.; Lesaint (Werner), 1 min. 58 3-5 sec.; Berny, 2 min. 10 sec.; Jolivet, 2 min. 25 2-5 sec.; Mme. Jolivet, 2 min. 43 2-5 sec. Cissac's time is a record, the previous best having been to the credit of Bucquet (1 min. 56 3-5 sec.). Event No. 2, for motor-cycles (non-pedalling), brought out six entries. Cissac again proved the winner, covering the mile in 1 min. 49 3-5 sec., with Rivierre second in 2 min. 14 2-5 sec.

In Class B (motor-cycles) the first contest was for machines with only one passenger (the driver). Twelve entries were received; Osmont proved the winner, doing the mile on a 9 h.p. De Dion trike in 1 min. 15 sec.; Reith, on a 12 h.p. Buchet, was second (1 min. 25 2-5 sec.); and Gasté, on an 8 h.p. Liberator-Soncin, third (1 min. 26 2-5 sec.). Osmont's time for the kilomètre—38 1-5 sec.—beats record by one second, but his time for the mile was eight seconds outside record. In the two-seated cycle class there were four competitors, the result being: 1st, Osmont

and one for cars with more than two seats. The former resulted as follows:—Ribeyrolles (three trials) petrol, 1 min. 21 sec.; carburetted alcohol, 1 min. 21 sec.; pure alcohol, 1 min. 37 sec.; Baras, 1 min. 23 2-5 sec.; Teste, 1 min. 26 2-5 sec.; Collin, 1 min. 28 2-5 sec.; Tart, 1 min. 28 4-5 sec.; Théry (two trials): 1 min. 37 1-5 sec. and 1 min. 33 4-5 sec.; Gabriel (three trials): petrol, 1 min. 40 3-5 sec.; carburetted alcohol, 1 min. 39 2-5 sec.; pure alcohol, 1 min. 30 2-5 sec.; Page, 1 min. 41 2-5 sec.; Jacquelin (two trials): 1 min. 41 1-5 sec. and 1 min. 43 4-5 sec.; Mercier, 1 min. 44 1-5 seconds; Demester (two trials): spirit, 1 min. 48 2-5 sec.; carburetted alcohol, 1 min. 39 4-5 sec.; Edmond (two trials): 1 min. 48 sec. and 1 min. 41 3-5 sec.; Delahaye (two trials): 2 min. 6 3-5 sec. and 2 min. 7 1-5 sec.; Fouillaron, 2 min. 5 sec. No record was broken in this event. The tests for cars with more than two seats resulted as follows:—Page, 1 min. 38 sec.; Ribeyrolles, 1 min. 28 sec.

Class E (cars weighing over 650 kilos.) proved a disappointment, for although ten entries were received, including Mr. Mark Mayhew's 50 h.p. Napier, Mr. S. F. Edge with two cars (a 16 h.p. and a 50 h.p. Napier), and Girardot with a 20 h.p. Panhard, only one starter—Bardon, on a 12 h.p. Bardon car, who did the mile in 1 min. 48 2-5 sec.

Class F (steam cars), for which there were but three entries, excited considerable interest. The event was run off in three sections. First, in a 6 h.p. light car, M. Léon Serpollet covered the kilomètre in 37 2-5 sec., and the mile in 1 min. 18 3-5 sec., thus easily beating the record he set up at Nice. In a two-seated 12 h.p. car Serpollet next made another attempt at record, but was not successful, his time being 1 min. 26 sec. In the class for four-seated "steamers," Rutishauser, in a 6 h.p. Serpollet, set up new times, doing a mile in 1 min. 24 sec.

In Class G (combination electrical and petrol cars) the only entry was Jenatzy's 100 h.p. car. Owing to M. Jenatzy's trouble with the A.C.F., the car was driven by Baron de Caters, who covered the mile in 1 min. 20 sec. The result was disappointing, but over a longer course it is considered the car could cover the mile in much less time.

Immediately the contests were over a large number of the competitors set off by road for Ostend to take part in the races which were held there on Tuesday last.

GENERAL VIEW OF DEAUVILLE.

(9 h.p. De Dion quad), 1 min. 30 1-5 sec.; 2nd, Cormier (9 h.p. De Dion quad), 1 min. 39 1-5 sec.; and 3rd, Bardin (9 h.p. De Dion quad), 1 min. 44 1-5 sec.

Class C (for voiturettes weighing less than 400 kilogrammes) had nine entries, and resulted as follows:—(1) Truffault (12 h.p.), 1 min. 28 2-5 sec.; (2) Barbaron, 1 min. 32 2-5 sec.; (3) Denesle, 1 min. 37 3-5 sec.; (4) Oury (8 h.p. Renault), 1 min. 41 sec. Truffault's time is a new record, the previous best being 1 min. 40 2-5 sec.

Class D (light cars weighing between 400 and 650 kilogrammes) brought out the following long list of entries:—R. Darzens, 16 h.p. Clément; Théry, 16 h.p. Decauville; Page, 16 h.p. Decauville; Gladiator I., 16 h.p. Gladiator; Gladiator II., 16 h.p. Gladiator; Gladiator III., 16 h.p. Gladiator; Testé, 16 h.p. Panhard; Gobron-Brillié, 12 h.p. Gobron; Clément I., 16 h.p. Clément; Clément II., 16 h.p. Clément; Ribeyrolles, 20 h.p. Darracq; Baras, 20 h.p. Darracq; Edmond, 20 h.p. Darracq; Viguier, 12 h.p. Korn; H.-P. Deschamps I., 12 h.p. Deschamps; H.-P. Deschamps II., 12 h.p. Deschamps; Buchet, 20 h.p. Buchet; E. Jacquelin, 10 h.p. Jacquelin; A. Collin, 12 h.p. Sirene; Vital-Bouhours, 12 h.p. Darracq; Darracq IV., 12 h.p. Darracq; Oury, 10 h.p. Renault; Darracq V., 12 h.p. Darracq; Delahaye, 6 h.p. Delahaye; Fouillaron, 6 h.p. Fouillaron. The event was run off in two series, one for one or two seated cars,

THE Nottingham and District Automobile Club has decided to defend all members summoned for exceeding the legal limit where such excess of speed has taken place upon the open roads without endangering the safety of others.

MR. RUSSELL SKINNER, who represents the Locomobile Company of America, is now staying at the Spa Hotel, Tunbridge Wells, where he will be pleased to meet intending purchasers of motor-cars, and take them for trial runs.

OWNERS of motor cars, mechanics and drivers, should be glad to hear of the employment agency which has been started by the Motor Mart, of Euston Road, N.W., where drivers and engineers seeking employment can register their names free of charge.

A MILE motor-cycle handicap was one of the events of the Lincoln Bicycle Sports on Saturday last. Winners of heats were G. J. Wilkinson, Lincoln, 1 h.p. Stonebow bicycle; T. H. Tessier, London, 1½ h.p. Werner bicycle; G. Hunt, Nottingham, 5 h.p. Darracq tricycle; R. M. Wright, Lincoln, 2½ h.p. De Dion tricycle. In the cross heats Tessier beat Wilkinson, the driving belt of whose machine came off in the first lap; Wright beat Hunt, who gave up in the first lap on losing his switch. The final winner was R. M. Wright, whose time was 2 min. 36 2-5 sec.

A DEMONSTRATION of motor-cars, under the auspices of the Lincolnshire Automobile Club, was held at Billingborough on Saturday afternoon, and proved a considerable attraction. Cars were present from all parts of South Lincolnshire, and Dr. Cragg gave an interesting lecture on the working of different types. Colonel de Burton entertained the motorists and their friends to luncheon at Buckminster Hall, and the cars, after the lecture—which was well attended—paraded to Threekingham House, where Captain Cragg entertained the party to tea.

CORRESPONDENCE.

AERIAL NAVIGATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to "Automan's" comments in your last issue on my letter to your contemporary, allow me to say that I knew M. Santos-Dumont's vessel was *slightly* heavier than air. For purposes of true flight this is not sufficient, and for such purposes is practically the same thing as being only slightly lighter than air—i.e., the condition of the other gas-sustained vessels when loaded up to start. I think M. Santos-Dumont will recognise the truth of that statement and readily endorse it, that is, if he has made any experiments at all in *true* free flight. A gravity aerial vessel is understood to mean one *immensely* heavier than air—i.e., comparable with the birds, which are roughly six hundred times heavier than the air displaced by them.

When advocating the course of making the large sailing birds our models, I had this condition in mind (among others), and repeat my statement emphatically, that gravity is indispensable to their flight; and will add, that if materially lightened, they could not fly at all. This condition differs very widely from that of M. Santos-Dumont's gas vessel. The greatest living and deceased authorities on flight agree in the fact that the sailing birds do make use—and excellent use—of the winds for sustentation, as well as for propulsion, which only their gravity, in conjunction with the *tension on their pectoral muscles*, enables them to do. As I remarked, these birds are known to have very little muscular power, as compared with small birds, proportionately, and so allow the combined action of gravity and wind pressure to do the major part of their work for them, and fly passively. Without weight there can be neither momentum nor inertia, both properties being very essential to true flight.—Yours faithfully,

SIDNEY H. HOLLANDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Not having the capital myself to experiment with an aerial motor, perhaps one of your readers would like to do so on the following description of, I think, a very feasible machine. The usual cigar-shaped gas-holder, supporting a platform underneath; two motors side by side working independently of each other; each motor to drive a three-bladed fan on a horizontal principle, about fifteen feet apart, across the centre of the platform, for ascending. Bevelled wheels on the shafts would drive two stern fans for propelling the machine. Having independent motors, the one could be slowed down or increased in speed for turning the machine round. It would not be against the buoyancy to have one side higher than the other; a shifting ballast might be necessary in windy weather. No rudder would be required. To guard against the accident of one motor refusing to work, a clutch that would connect the two motors would be a safeguard, so that one could drive all four fans.—Yours truly,

HOPEFUL.

HOSPITALITY (?) AT OLD ENGLISH INNS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the interests of automobilism I venture to lay before your readers the following instance of the very unbusiness-like way which some innkeepers run their houses upon. I was out driving upon the evening of the 26th ult., in the neighbourhood of the well-known "Ferry Boat" inn at Tottenham, upon a belt-driven light car, when the connecting link of the belt-shifting gear snapped suddenly. Being dark at the time, pouring with rain, and close to the "Ferry Boat," we naturally thought we should be right for standing the car up for the night, especially as "mine worthy host" displayed a large signboard over three stables (which were empty) stating there was good accommodation for cyclists, pleasure parties, horses and traps, etc., etc. Imagine our surprise when we were curtly refused to be allowed to put the car in a stable for the night, and this after

explaining that it had broken down. We therefore had to push the car about half a mile further on until we came to the "White Hart," where we were willingly allowed to stable our car at a most reasonable charge.—Yours truly,

WALLER MARTIN.

MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been much interested in your articles on motor-bicycles, and I can quite understand the difficulties experienced by some riders when first trying such machines. All these difficulties, however, quickly disappear with a very little practice. I have myself been riding a motor-bicycle of the Minerva type, made by Ratcliffe, of Frinton-on-Sea, for the last six weeks, and I know of no more pleasant means of locomotion. I can safely say that anything more simple, neat, compact, or easy of management than the machine I have, it would be difficult to imagine. I am finding it 50 per cent. more powerful now that, with the use I have had, the working parts are all wearing to a face. I consider my machine is the best pattern to ride as an ordinary bicycle should the rider at any time find himself short of petrol. The extra weight is hardly noticed, being below and between the two wheels, which is the best position for carrying, as here it acts as ballast to a boat, reducing vibration and making the machine run perfectly true and straight with an entire absence of sway.

My machine does the maker credit, for although it has carried me many hundreds of miles, I have not had a single hitch with it since I started.—Yours truly,

J. W. MOSS.

THE ROOTS AND VENABLES CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a Roots and Venables oil-car which has recently had a new ignition tube fitted, with the result that it fired too soon until I put a collar round the lower part to shield it from the flame. It now fires correctly, but takes a lot of starting from cold—about eighty turns of the handle sometimes. Also I find the blow lamp a great nuisance. It is required to start the car, and also to keep the carburettor hot if car is stopping and engine also stopped. The small hole is always apt to clog up, or the pressure pump of same work badly.

The spokes I find give way frequently, one every thirty miles or so, no doubt granite setts have something to do with it. The solid tires are in good condition. The makers say they do not have trouble with spokes. I wonder if I went in for pneumatics if I should be transferring the bother from the spokes to the tires, and be no better off. I may say faulty spokes are always promptly replaced and properly tensioned. If your readers can help me at all with advice I shall be obliged.—Yours truly,

"ROOTABLE."

A GOBRON-BRILLIE motor-car, the engine of which is operated by alcohol, has lately been shipped from Paris to Tonkin.

DURING the International Engineering Congress, held in Glasgow this week, several papers of great interest to automobilists were read, including one by Professor Hele-Shaw, on "The effect of temperature on cooling water in high-speed automobiles."

CHARRON and Girardot, two well-known French motorists, left Paris last week for New York, via Havre. They have taken with them a 40 h.p. Panhard, a 8 h.p. racing voiturette, and a 10 h.p. light car.

THE German Minister of the Interior has issued an order prohibiting races of automobiles on all public highways, roads, and public places, and has instructed all the provincial authorities not to allow such races in future.

THE French Minister for War has given orders that automobiles shall be used as much as possible in the forthcoming Rheims review. All the military motorist engineers, both on the active and reserve lists, have been warned that they will be called upon to appear before the Czar, who desires to make a study of military automobilism.

HERE AND THERE.

THE Taunton Rural District Council has approved the Long Ashton Rural District Council's proposals regarding the pace of motor-cars, and that such cars should be licensed and numbered.

MR. G. WALMSLEY, of Guildhall Street, Preston, points out in a local paper that the town is on the direct route from the south to the lake district, and urges that as a reason for Prestonians to be tolerant to the motor-car.

A MOTOR-WAGONETTE, licensed to carry eleven persons, began to run this week from Scarborough to Filey, Forge Valley, and other resorts of visitors. On each trip the vehicle carries the full complement of passengers.

MESSRS. BAGNALLS, LTD., of 133, Steelhouse Lane, Birmingham, have taken up the agency in Birmingham and district for the Werner motor-bicycle; they will carry a stock of these machines, as well as of motor accessories.

IN Dr. Barton's airship, the patents of which are said to have been purchased by the British War Office, the propellers are driven by three light engines operated with ordinary motor-car spirit.

A MEETING was held on Wednesday last to consider the possibility of starting a motor-car service between Aston Clinton and Tring Station, and other places in that district of Buckinghamshire.

THE police in the Kenilworth division are very active in keeping a look-out for automobiles transgressing the legal speed limit, and motorists who pass through that portion of the county will do well to avoid the temptation to scorch, which the excellent roads offer.

AT the Lexden Brewster sessions recently held, Superintendent Ackers called attention to the serious danger caused by motor-cars in regard to horses left unattended outside both private and public houses. The Chairman said it was very much people's own fault. Why did they not have iron rings fastened on each side of their front doors?

THE British Power, Traction and Lighting Company, Ltd., of York, inform us that a speed trial of one of the new 6 h.p. P.T.L. Gardner-Serpollet steam carriages was made on Monday last on a straight stretch of road on the Wolds, when the car passed over a measured mile on the level, with a flying start, in one minute and eleven seconds. The trial was timed by several people independently.

A MOTOR-CAR containing two persons, whilst proceeding on Saturday afternoon along the Station Road, Newmarket, met a cart laden with scaffold poles, and in some unexplained manner the longest pole caught the front of the motor, smashing off the front seat and damaging the mechanism. The force of the impact smashed the scaffold pole, overturned the cart and horse, and threw out the driver. The motorists and driver of the cart escaped with comparatively slight injuries.

A MOTOR-CAR, driven by Mr. Arthur Hines, of London, accompanied by Mr. Robert Bloxham, of Leytonstone, Essex, whilst descending a steep hill at Harewood End, near Ross, on Sunday evening, came face to face with a pony and gig at a sharp corner in the road. Mr. Hines, with a view to avoiding disaster, steered the car straight for the hedge, but the pony took fright and sprang forward at the same time. The car ran violently into the pony, knocking it and the trap over, and throwing out the occupants of both car and trap, fortunately without serious results to any.

THE "Devonshire" is the name of a new motor-bicycle which has been put on the market by Mr. J. T. Walker, of 192, Brookhill, Sheffield. The engine, which is of 2½ h.p., is placed in a vertical position in the fore part of the frame behind the handle bar. The machine is driven by a special belt from a wooden pulley attached to the spokes of the back wheel by special clips. The carburettor is placed behind the saddle, and the pipes run under the top tube of the frame to the motor, so that in no way do the legs of the rider catch in any of the connections. The

front part of the machine is specially strengthened by duplex forks. The adjustment of the belt is effected by a ball-bearing jockey pulley which slides upon the bottom stay of frame. The complete machine weighs about 70 lbs.

MR. D. CITROEN, of 45, Holborn Viaduct, London, E.C., has issued a warning against purchasing fittings or motors infringing the patent for the Minerva motor for bicycles. Purchasers of such articles will be liable to an action at law, involving the payment of damages and costs and the forfeiture of the infringing article. All motors of the genuine Minerva manufacture are stamped with the registered trade mark "Minerva, Anvers," except in a few instances where cycle makers have obtained the permission to sell the Minerva motor under their own name.

THE Memorial Grounds at Canning Town were well patronised on Thursday, last week, to witness the fourth annual cycling meeting held under the auspices of the Danes Cycling Club, the proceeds of which will be devoted to the Poplar Hospital Fund. The programme included a motor-cycle handicap, also an exhibition ten miles ride on a 12 h.p. motor-racing spider by Mr. T. Maltby, junr. In the ten-mile motor-cycle handicap Mr. Maltby proved the winner, he covering the distance from scratch in 17min. 22.5sec., Mr. M. Moyle (1 lap start) being second.

A MOTOR-CAR accident, by which four people were injured, occurred in North-street, Brighton, one afternoon this week. Mr. Eric Chaplin, of Stafford House, St James's, London, was driving his motor-car up the hill when the connecting chain came off one of the wheels, and the car ran back into the busiest part of the town, at the junction of five streets. To avoid colliding with a bus laden with passengers, Mr. Chaplin ran his car on to the pavement at the corner of West-street. The pavement was thronged with people at the time, and several were knocked down. The injured were taken to the hospital, where two were detained.

THE United Motor Industries, Limited, of 40, Holborn Viaduct, evidently do not intend to let the grass grow under their feet, judging from the number of new lines they are introducing even at this period of the season, and also the very material alterations in prices which they are making in many directions. They have just issued two new lists of electrical parts, fittings and accessories, including fresh prices for the famous Bassée and Michel coils, for which they are the sole British agents. They are also getting out a new lamp list for the coming winter trade. Copies of both these lists will be sent on application.

A PARAGRAPH went the rounds of the daily Press last week, that the Worcester new motor fire-engine broke down while out on a trial trip, owing to a tube in the boiler bursting. The writer of the paragraph referred to the trial as a fiasco, and added, "The firemen had to return in cabs, while the engine was towed back by horses." Mr. C. T. Crowden, who is responsible for the conversion of the engine from a horse-drawn vehicle to a self-propelled machine, considers the Press criticisms have been very unfair, and likely to discourage advancement in this direction, and sends us the following particulars:—"The horse-drawn engine was constructed in 1883 by a well-known firm, and it has travelled about 300 miles since its conversion into a motor, and has faced all the hills and roads that it has been put on. The other Friday a twenty-four mile journey was taken over some of the hilliest roads, and the engine was then taken to the river to pump water. The trial was a pronounced success, and anything but a 'fiasco.' What really happened was the giving way of one or two boiler tubes, which stopped the supply of steam at once—an occurrence which might happen when pumping on a fire quite as easily as when travelling, and which takes place every day on the railway, and in the Navy. One may as well call the Navy 'a fiasco' because a boiler in one of the ships burst a tube. Fortunately this engine is so arranged that if a breakdown occurs horses can be attached at any time. The boiler was first made in 1893, and has failed twice in that period, through tubes giving out."

FURIOUS DRIVING CASES.

At Chertsey Arthur Du Cros, of Shepperton, was summoned for driving a motor-car at an excessive speed in Bridge Road, Chertsey, on August 18th. Mr. Samuel Flemming defended. P.C. Goobystated that at 6.15 p.m. on the day in question he was on duty in the Bridge Road, Chertsey, when he saw the defendant, driving a motor-car in the direction of Chertsey. He was proceeding at a reasonable speed, but after he had passed witness he put on a much greater speed. Witness timed him over a distance of 176 yds., which he accomplished in 20 secs., or an average speed of eighteen miles an hour. Witness did not see him any more on that day, but on the 19th he saw the defendant coming round Bell Corner on his car, and called to him to stop. Defendant took no notice but went on. Witness afterwards ascertained his name and address, and on the evening of the 20th he again saw the defendant in Guildford Street, and asked him to pull up, which he did. Witness asked him if he was driving a motor-car in the Bridge Road, on the 18th, and at first he said, "I don't know," but, after speaking to a man on his left, he said, "we were out with the children on Sunday night." Other witnesses estimated the speed at between sixteen and eighteen miles an hour. The defendant stated that on August 18th he was driving a motor-car in the Bridge Road. He went to Virginia Water, and returned the same way. The witness then proceeded to refer to the interview he had with the constable, who, he said, spoke very fairly to him. He (defendant) asked him how many passengers he saw in the car, and he said four, whereupon witness said, "it could not have been my car, as I had six." In reply to the Rev. H. J. De Salis, the defendant said that two ladies who were in the car had a child each on their knees. He denied that he went at an excessive speed on the day named. He went to London in his car, and passed fifty policemen practically every day, and had never been pulled up as to his speed. The constable had never said that he identified him (defendant) as the driver of the car. The magistrates retired to consider their decision, and on returning into Court, the Chairman said there was considerable doubt in the case, and the summons would be dismissed. The Bench then proceeded to hear another summons against the defendant for driving the motor excessively in Guildford Street on August 19th. P.C. Larby stated that on the evening in question he stood at the church end of Guildford Street, in company with P.S. Wright and Mr. R. F. Cooper, the relieving officer. He saw a motor-car coming towards them at a great pace, but when near witness the car made a great noise, as though its speed was altered, or the brake put on. The car was stopped by Sergeant Wright, who was on his annual leave. Mr. Flemming: Then I must ask that the case must be dismissed. Inspector Marks (who was in charge of the court): It does not matter; there are other witnesses: Mr. Flemming: But the sergeant took the charge. Mr. R. F. Cooper was then called, and stated that he was with Sergeant Wright and the constable. When he saw the car it was coming at a very rapid rate. He certainly thought that the car was proceeding at the rate of sixteen to eighteen miles an hour. The defendant stated that he had come from Bagshot. The governor of the machinery was not acting properly, and it made a great noise. Speaking of the meeting of Sergeant Wright, he said that he asked the sergeant the way to Chertsey Bridge. He (Sergeant Wright) then remarked, "But what rate do you reckon you came down there at?" and he told the sergeant to look at the gear to see that he was on the second speed, nine miles an hour. This case was also dismissed.

At Portsmouth, Charles Heffer was summoned for driving a motor-car in Broad Street, Portsmouth, at a speed exceeding twelve miles an hour, on August 8th. Mr. T. W. Staple Firth, of London, appeared for the defence. Constable Pratt stated that he saw the defendant proceeding at a rapid rate from Southsea Common along by the barracks to Pembroke Road. Witness, who was accompanied by Constable Sturgess, mounted on bicycles, gave chase, but although they went at the rate of eighteen miles an hour they could not catch the defendant. At Point, however, the defendant was obliged to stop, and the constables took his name and address. The defendant's companion said, "You would never have caught him if he had not stopped. We were going at twenty-five miles an hour." Witness was of opinion that the rate of speed was dangerous, and as the defendant proceeded along Broad Street several horses were frightened by the car. Witness estimated the speed by the aid of a "metroscope," which had been tested that morning and found to be correct. Mr. Firth contended that the constables should have tested the speed of the defendant for twelve miles. If they took a shorter distance, and alleged that he was exceeding the speed laid down by the Local Government Board regulations, the defendant should have been summoned for furious driving. For the defence, it was stated that the car was only geared up to about eleven miles an hour, and the reliability of the metroscope was questioned.—The Bench retired, and after a lengthy deliberation in private, said the question to be decided was one of pace, and they considered that the evidence of witnesses on both sides was very conflicting as judges of pace. There was an element of doubt in the case, and the defendant would have the benefit of it. The information was dismissed.

ALBERT FERRELL, of London, was summoned at Bourne Petty Sessions, Lincolnshire, for refusing to stop a motor-car when requested by the driver of a restive horse, and also for furious driving. The driver of the horse gave evidence as to the defendant refusing to stop when requested, and the police proved the furious driving of the car. The superintendent of police said he saw the motor-car pass his office, and before he

could get to the door it was almost out of sight. He at once telegraphed to a neighbouring town, but had a wire from the constable there to say that the car had already gone, the distance of nine miles having, according to the police evidence, been covered in ten minutes. A Bourne tradesman said when the car stopped in the town for a few minutes the driver told him that they had come from London that morning (a distance of nearly 100 miles) in three and a-half hours, and that the car could travel 60 miles an hour. Defendant did not appear. The chairman said the cases were as bad as they could be, and they would impose the maximum penalties—£10 and costs in the first case, and £5 and costs in the second—a total of £17. In the first case there would be a distress issued, and in the second imprisonment with hard labour in default of payment.

At the Kingston County Bench, Nevill Copland, of Teddington, was summoned for having driven a locomotive in Ewell Road, Tolworth, on the 19th ult., at a speed greater than was reasonable and proper, having regard to the traffic on the highway, contrary to an order of the Local Government Board. P.S. Richardson deposed that about 6.10 p.m. on Monday, August 19, he saw the defendant, who had no hat on, driving a four-wheel motor-car along the Ewell Road, Tolworth, at about twenty miles an hour. Witness ran into the roadway with the intention of putting up his hand to stop the defendant, but he had passed before this could be done, and turned into Kingsdown Road, which was a private road with a barrier across. Going up to the defendant witness asked for his name and address, and told him he would be reported for a summons for furiously driving his motor-car in Ewell Road. There was not much traffic about at the time, but had there been any the defendant could not possibly have pulled up. The Chairman: Why is the summons taken out under this section and not under the section for driving more than twelve miles an hour. This raises the whole difficulty as to traffic. Defendant: There was no traffic whatever about. Sub-Divisional Inspector Brice said that he was responsible for the summons being taken out under this particular section. It was the main road to Surbiton, and just at this spot it was very dangerous to drive at such a furious rate. The Bench decided to convict, and imposed a penalty of £2, Mr. Cockburn advising that any future summonses should be taken out under the other section.

At the Knaresborough Petty Sessions, Walter McCormack, motor-car driver, of Harrogate, was charged by the police with furiously driving on the York and Harrogate road at Allerton on August 24th. Police-constable Sweeting stated that owing to the prevalence of furious motor-car driving a distance of a quarter of a mile was measured on the road, and when the defendant's car came along it was timed and found to cover the distance in three-quarters of a minute. When he and another constable stopped the car and charged the defendant, who was driving, the owner, a gentleman whose name did not transpire, came up to the police and told them he would rather pay £10 than have the case appear in the papers. He offered the officers £1 each, and said he would send them £5 each if they gave their addresses. A sovereign was pressed upon one officer, who was unable to return it, but the other was able to prevent the owner from slipping a sovereign into his hand. Both officers gave evidence, the one producing the sovereign in evidence against the action of the owner of the car. There was no appearance of the defendant driver, and the chairman (Mr. W. Sheepshanks) commented on the attempt to bribe the police, which, he said, was a shameful thing, but the police were not to be bribed. Such a practice, he said, would defy the law and corrupt the police. The full penalty of £10 and costs would be imposed. In reply to an inquiry by Col. Ormsby, the Bench made the suggestion that the sovereign should be sent to the Police Orphanage Funds, the gentleman's address being unknown.

At Luttermworth, Harry Taylor, cycle maker, of Kettering, was charged with driving a motor-tricycle more than twelve miles an hour, at North Kilworth, on the 17th ult. Defendant pleaded guilty, but stated he had the machine under proper control, and could pull up in three yards. Superintendent Agar stated defendant was coming down the hill and along the flat by Mr. Entwistle's at quite twenty miles an hour. Defendant pulled up when he told him, and gave his name and address.—Fined £1, and 8s. 6d. costs.

MR. HUGH MOFFATT, of Coventry, was charged with furiously driving a motor-car at Severn Stoke on the 11th ult. P. C. Jeffs stated that he saw the defendant coming down Stoke Hill very fast, "like the wind," when he passed him, and the hill was a very dangerous one.—Fined £5, and 9s. 6d. costs.

At Sleaford police-court, Albert Ferrell, of London, was summoned for furiously driving a motor-car at North Kyme on August 13th, and a second summons charged him with furiously driving the car at Sleaford on August 14th. Mr. Richard Stow, of Haverholme, said the car passed him at the rate of 25 miles an hour. Mrs. Stubley, of North Kyme, said the car, when it was being driven at a dangerous rate, ran over and killed a sheep. Supt. Taylor said the car left Bourne at 10.25, and passed through Sleaford at 10.57, going at a furious rate. Defendant said the brake got out of order, and the car ran away with him. In the second case, Mr. Godson and Mr. A. C. Howard, solicitors, gave evidence as to the pace at which the car travelled through the streets of Sleaford. George Blackwell considered the car went at the rate of 39 miles an hour, judging by the time it occupied in going 200 yards. Defendant said he was a driver for Mr. Charles Ansell,

stockbroker, of London, but the pace stated had been greatly exaggerated. He had been fined at Bourne on Thursday, last week, and had to go to Norman Cross Court the following day. Fined £13, including costs, but time was allowed in which to pay.

LE MARCHANT, of Chobham Place, Surrey, was fined £5 at Guildford on Saturday for driving his motor-car at a greater speed than was reasonable and proper.

At Ashford (Kent) police-court, Horace O. Hall, of Tonbridge, and W. Fleming Blaine were fined £5 each for driving motor-cars at more than twelve miles an hour. Constables who were stationed on the road swore that Mr. Hall did a quarter of a mile in 35 seconds, or at the rate of 25.57 miles an hour, while Mr. Blaine's time was stated to be 40 seconds for the same distance, or at the rate of 22½ miles an hour.

At Norman Cross (Huntingdonshire), Albert Ferrell, of London, was summoned for furiously driving a motor-car on the Great North road on August 14. According to the police evidence, the defendant was timed to cover three-quarters of a mile in one minute. The defendant said the motor ran away from him. Superintendent Allen stated that defendant had been previously charged with furious driving. Defendant, who was fined £10 and costs at Sleaford the day before, was now called upon to pay £10 and 4s. costs.

At Aberdeen, James Getan, Vicomte de Thiene, a French nobleman, was charged before Sheriff Begg, with having, on the 1st of August, on Deeside road, at Cults, driven a motor-car at a speed of between twelve and twenty miles an hour. The policeman and another witness estimated the rate at which the car was running at about twenty miles an hour. The charge was found proved, and a fine of thirty shillings imposed.

At Derby, Henry Butler was summoned for furiously riding a motor-bicycle on August 24th. Police-constable Gledhill stated that the defendant rode at the rate of eight miles an hour across Pear Tree Road. In Roe Street he only avoided a collision with a woman who was crossing the road with a perambulator by jumping off the machine. Defendant asserted that he was not travelling at a greater rate than six miles an hour. He was fined £2 and costs. The chairman said it ought to be made known that the public had the first right to the road, and that cyclists and others must pull up and wait for pedestrians to cross.

At Harewood End (Rosa) Petty Sessions, Mr. Lorraine Barrow was summoned for driving a motor-car at an excessive speed. Mr. T. Hutchinson (Hereford) appeared for the defendant, who was said to be away in America. One witness said the car passed him at the rate of between forty and fifty miles an hour. It went by him like a flash of lightning. Police-Sergeant Lloyd said that when he spoke to defendant about the matter he said the pace could not be fifty miles an hour, but it was ridiculous to think he should only go at twelve miles an hour on a straight road. The chairman said the Bench thought it was a case which should be marked with a considerable penalty; three recent serious accidents in the district pointed to the danger. Defendant would be fined £10 and 19s. costs.

At Corwen police court, Captain J. Griffiths, of Llangollen, was charged by Police-sergeant Hughes with having driven a motor-car through Corwen furiously, and to the danger of life and limb of pedestrians. Sergeant Hughes said he was sitting in the police-station, which abuts on the highway, when he heard the sound of a motor-car, which appeared to be going at a furious rate. It flashed past, and he had no opportunity of arresting the driver's attention. Police-constable Lloyd said that complaints had been made to him of the furious rate at which the motor was going, and they went to the post-office and wired to Sergeant Roberts at Cerrigy-Druidion to intercept the car. The driver left Corwen at nine minutes past three, and, according to the time taken by Sergeant Roberts, he arrived at Cerrigy-Druidion at 3.36, having travelled the distance in 27 minutes. Police-sergeant Roberts said that he received the telegram from Corwen about 3.30, instructing him to intercept a motor, and Captain Griffiths arrived about 3.36. Defendant told him he had been driving his machine at the rate of twelve miles an hour. The Bench imposed a fine of £1 14s., including costs.

THE SPEED OF MOTOR-CARS IN SCOTLAND.

The following important order has just been made by Lord Balfour of Burleigh which alters the general regulations respecting light locomotives in Scotland. The effect of it is to raise the maximum limit of speed for light locomotives (motor-cars, etc.), in Scotland from ten miles an hour to twelve miles an hour. The order comes into force at once.

Whereas Article IV. of "The Light Locomotives on Highways (Scotland) Regulations, 1896," made by the Secretary for Scotland (hereinafter called the principal regulations) provides inter alia as follows:—

"Article IV.—Every person driving or in charge of a light locomotive when used on any highway shall comply with the regulations hereinafter set forth, namely,

"(2). He shall not under any circumstances drive the light locomotive at a greater speed than ten miles an hour."

And whereas it is expedient that the said article should be amended.

Now, therefore, I, the Right Honourable Alexander Hugh, Lord Balfour of Burleigh, K.T., His Majesty's Secretary for Scotland, do, in

pursuance of the powers given to me by the Locomotives on Highways Act, 1896, make the following regulations applicable to Scotland with respect to the use of light locomotives on highways:—

REGULATIONS.

1. The words "He shall not under any circumstances drive the light locomotive at a greater speed than ten miles an hour," occurring in Article IV. of the principal regulations are hereby revoked, and the article shall be read as if in lieu thereof the following words were inserted, namely:—

"He shall not under any circumstances drive the light locomotive at a greater speed than twelve miles an hour."

2. In all copies of the principal regulations which shall be printed after the date hereof Article IV. shall be printed as hereby amended.

3. These regulations may be cited as "The Light Locomotives on Highways (Scotland) Regulations, 1901."

Given under my hand and seal of office at Whitehall this twenty-sixth day of August, one thousand nine hundred and one.

BALFOUR OF BURLEIGH, Secretary
for Scotland.

NO LICENSE.

At Bournemouth. The Bournemouth Motor-Car Company was summoned for working a motor-car on August Bank Holiday without a license. Mr. W. H. Druitt prosecuted on behalf of the Bournemouth Corporation. P.C. Chick, in giving evidence of the serving of the summons, said he served it at the office of Mr. Bell, at the New Era Laundry at Pokesdown. An objection was taken to this course by Mr. Druitt, and the Bench decided to adjourn the case in order that a fresh summons might be issued.

MOTOR-CAR AND COSTERMONGER.

At Stockton County Court, John Richard Davey, hawker, and Sarah Jane Davey (his daughter) sued William Sheriton Edrington, retired engineer, Norton, for £30 10s. damages. According to the evidence for the plaintiffs, they were driving a horse attached to a hawker's cart at a walking pace down Billingham Bank, near Stockton. When defendant was coming up the bank on his motor-car, Mr. Davey signalled and shouted to the defendant to stop, but he took no notice, and did not slacken speed, passing plaintiffs at a pace which was estimated at 12 or 14 miles an hour. Mr. Davey's horse reared, and Miss Davey was thrown out, whilst the horse bolted down the hill, where the cart was overturned. It was contended that as plaintiff signalled the defendant should have stopped. His Honour said his experience was that they never did. For the defence it was contended that plaintiffs were coming down the hill at a trot, and that the motor-car stopped, after which the horse bolted, and the cart was overturned. The car could not go more than ten or eleven miles on the level, and not more than four and a half miles up that particular bank. It was suggested that plaintiff had been guilty of contributory negligence by not getting out and holding the horse. His Honour thought under the circumstances he would have gone into the next field and have left the horse to take care of itself. He gave judgment for £25 10s., which included £7 7s. for the daughter.

A MOVEMENT is on foot to start a Mid-Kent automobile club.

MESSRS. HUTTON, of Dublin, have now opened a depot at Montgomery Street, Belfast. This should prove a great convenience to motorists in Ulster.

Two motorists at Grenoble, France, are reported to be about to make an attempt to ascend to the summit of Mont Blanc in a motor-car.

DR. S. F. COLOHAN, of Dublin, last week drove out her Excellency the Countess Cadogan on his Daimler car. Lord Coventry was also on the vehicle, and a long run was taken from the Viceregal Lodge to the neighbourhood of Bray and back.

SOME experiments have been carried out by Professor Behrend at the Hohenheim Technological Institute on the use of alcohol in motors in place of petroleum. The motors used were of German make and 6 h.p. The first experiments were made with ordinary methylated spirits and later with alcohol containing varying proportions of benzine, a liquid which forms a satisfactory denaturing agent, being cheaper than those usually employed. Using methylated spirit the cost of working proved to be 1.43d. per horse-power per hour, while admixture of benzene to the extent of 68 per cent. reduced this amount to 1.25d. for the same amount of energy. Using petroleum the cost with the same motor amounted to 1.2d. The alcohol employed for trade purposes in Germany is a potato spirit costing about 11d. per gallon.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, SEPTEMBER 14, 1901.

[No. 132.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

TO the last moment of his visit to Homburg His Majesty was true to his automobile, journeying in it from Homburg to Frankfort *en route* for Copenhagen. Arrived at Fredensborg, His Majesty was soon a-motoring again. On Monday he took a lengthy spin in the direction of Frederiksborg, accompanied by King George of Greece and the Princes Frederick

and Hans. The King's automobile created a sensation, and before starting one of the young princes, who is an expert photographer, took a picture of the car and its royal occupants. Motoring may in fact now be regarded as the sport of kings and queens *par excellence*, for not a day passes at Fredensborg without King Edward taking a run on his car, usually accompanied by one or other of the crowned heads or princes foregathered at the royal Danish palace. As notices have for some time been appearing in different papers stating that King Edward is using various makes of cars, the Daimler Motor Company, Limited, ask us to mention that the only motor-carriage His Majesty uses is the 12 h.p. Daimler they had the honour of constructing to his special order last year. He has used this car continuously, and has it with him at present on the Continent. We are pleased to add that, though he has driven in it some thousands of miles, it has given every satisfaction and has been the means of making His Majesty a most enthusiastic automobilist. It is also pleasing to know that the car is British built throughout.

"Scotland for Ever."

OUR friends across the border are naturally jubilant at the success of the Scottish vehicles running in the recent trials, and the fact that the Mo-car—an essentially Scotch production—has done so well has filled the hearts of Glaswegians with delight. The trials were essentially reliability trials, and that the motor-cars were reliable we can testify, as we saw as much of them on the road as any one, and never once did we see them other than travelling. The verdict as to the cars on Saturday was received with extraordinary enthusiasm. The "Argyll's" appearance is that which appeals apparently perhaps more forcibly to the Sassenach, but the car ranks equal if not superior to any of the voiturette class imported from abroad. Its record during the trials places it as the best car yet turned out from Scotland. The Albion is a good car, while the vehicle handled by Mr. Stirling, considering its price, is not to be beaten.

Observers and their Ways.

A DRIVER who had a good car was fortunate, but he who had also a good observer was doubly fortunate. The driver was at the mercy of the observer, and was told when to go fast or when to go slow, and when it is considered that many of the observers had never been on a car, and that probably they did not study their ample instructions till they got on the

vehicle, it follows as a matter of course that "marks" were lost owing entirely to the lack of knowledge of the observer. Hence some cars losing marks from no fault of the drivers, and hence also some grumbings about the observers.

Motor-Car Wrecking.

A SERIOUS outrage of this nature is reported from the North. On Saturday night a motor-car belonging to Messrs. Davidson Brothers, of High Grange, Bishop Auckland, which regularly runs between that place and Crook, carrying passengers, was upset at a point in the road half-way between Howden-le-Wear and High Grange, by running into an obstruction which had been laid on the road. The passengers were thrown out of the car, but, happily, none were seriously injured. Examination of the roadway showed that a V-shaped wall had been built across it with stones from a neighbouring pit-heap, and this at a spot where there is a sloping bend in the road. Appearances all point to a premeditated outrage, which might easily have been attended with disastrous results had the motor-car been going at a faster speed. Local opinion is divided as to the perpetrators of the dastardly outrage. In some quarters it is believed that the obstacle was erected by the police, in the hope of capturing a well-known motorist suspected of exceeding the legal limit.

Produce Delivery by Motor-Car.

THE promotion of a company for the conveyance of fruit and farmers' produce generally and merchandise by motor-lorries between Maidstone and the metropolis, as well as other places, is in contemplation. Messrs. John Sibley and Co. have made a number of trials with a Milne's petrol lorry having a normal capacity of 45 cwts. The trial journeys thus far accomplished have given most gratifying and encouraging results. In one case a load of fruit was conveyed from Maidstone to London under six hours, starting at 8 p.m. and arriving at Covent Garden at 2 a.m., and the return journey was accomplished between 4 a.m. and 10 a.m. In another instance a load of merchandise from Maidstone was put on the Midland Railway at St. Pancras on the same day as the receipt of the order. On a third occasion fruit from Sittingbourne was delivered at Covent Garden at 3 a.m., the journey commencing at 7.30 p.m., and in short and repeated journeys with heavy loads the lorry has done far greater work in a given time than any pair of horses could have performed.

The Speed of Motor-Cars.

THE speed of motor-cars was one of the subjects discussed at a meeting of the Doncaster Rural Council last week. Mr. Batty (vice-chairman) said he had seen motor-cars travelling at the rate of from twenty to thirty miles an hour, which was extremely dangerous to traffic and to young children who might be playing in the roads. Mr. Harrison thought that motor-cars ought to be licensed, so that they could be easily identified. Mr. Kellett considered that motorists had no right to rush through a town or village as though it was

"thundering and lightning." He did not think the public ought to suffer because some maniacs had a motor-car. Magistrates at Lincoln and elsewhere had shown they had a "backbone" by the action they had taken when cases of furious driving had come before them, and he thought if other magistrates would inflict the full penalty the danger would soon cease. Mr. Batty moved that the West Riding Joint Committee be asked to enforce the law limiting the speed of motor-cars, and suggesting that they should be registered, and the motion was unanimously adopted. The same subject was also under discussion at a meeting of the Western District Committee of the County Council of Dumbarton last week, when Mr. F. C. Buchanan drew attention to the speed at which motor-cars travelled on Garelochside, alleging some of them whisked along at forty miles an hour. The chairman said he thought a prosecution or two would put down scorching and show that the county authorities were in earnest in the matter. It was agreed to instruct the chief constable to enforce the regulations.

CHARRON.—A CARICATURE SKETCH FROM *Le Rire*.

More Complaints.

AT the conclusion of the business at the Henley County Petty Sessions last week, Mr. Harrison said he wished to draw the attention of the police to the increased number of motor-cars running on the roads, especially from Reading to Henley, and the excessive speed that some of them travelled. Mr. Witherington also spoke, saying he had brought the matter before the Joint Committee at Oxford recently, and the chief constable said he would see what could be done. At the last meeting of the Camberley District Council, Mr. Brown drew attention to the excessive speed of motor-cars passing through the district, and moved that the attention of the police and Surrey County Council be called to the matter. Mr. Tew seconded, and said on one occasion he took the time of a motor-car which passed his place, and it took 4 minutes 45 seconds to get from there to a point over two miles away. Mr. Hollings said that, as a magistrate sitting on the Farnham Bench, he would endeavour to get any furious drivers who were brought before him fined as heavily as he could. The resolution was carried.

An M.P. on Motor-Cars.

CAPTAIN GREVILLE, M.P., though a staunch Conservative, is a powerful partisan of the motor-car. Not only does he ride one himself, but in a recent speech delivered on the occasion of a Conservative garden-party at Bradford, the captain went so far as to recommend the automobile to his constituents as a means of adding to the prosperity of the country. Captain Greville, who stated that his purpose was not to talk politics, alluding to the increasing popularity of motor-cars in this country, said we had been slow to recognise the value of these

self-propelled vehicles, but depend upon it they had come to stay. It was a great industry. One of the greatest problems of the day was the housing of the working classes, and, therefore, anything that made locomotion easier and swifter should be welcomed and encouraged. He saw in it great openings for young men with knowledge of machinery and engineering. A man who could drive and manage a motor-car would, with only a slight knowledge of engineering, be able to earn the same amount of money as skilled artisans whose training had been a matter of years.

Yorkshire Automobile Club.

A SHORT run will be held by the members of the Yorkshire Automobile Club to-day (Saturday) to Boston Spa, the arrangements being as follows:—Leeds members meet at City Square, 2 p.m.; Bradford members meet at Manningham Park, Lister Monument, at 2 p.m.; and Harrogate members at the Stray (Prince of Wales Hotel), also at 2 p.m. At 3.30 p.m. all members meet at Collingham Church and proceed to Boston Spa, where tea will be taken at the Royal Hotel. The arrangements for the return journey will be made en route. As several members have already signified their intention of joining this run the committee are specially anxious that all who possibly can attend will do so. The Committee is still open to receive suggestions from members as to destination and route of any future club runs.

The Tunbridge Wells Motor-Wagon Service.

THE London and Counties Distributing Company's motor-wagon service between London and Tunbridge Wells has been suspended. We understand that the stoppage is only of a temporary nature. The two wagons which have for the last few months been engaged upon the service have been found inadequate to cope with the large quantity of goods consigned to the company for prompt delivery, and many disappointments have resulted. In the course of a week or so it is proposed to resume the service by means of an increased number of vehicles, which it is hoped will be able to fill all the requirements of the body of traders who have not been slow to appreciate the advantages offered by the originators of the scheme.

No Sacrifice of Quality.

A STATEMENT in a contemporary to the effect that makers of motor-cars are sacrificing quality in order to cope with the demand is likely to seriously damage the industry unless promptly dealt with. There is, undoubtedly, a plethora of orders, but manufacturers know that repeat orders and recommendations—upon which so much depends—only come as the result of good workmanship and satisfactory running. At the time of the bicycle boom it was the case that quality was often overlooked in the desire for prompt delivery, but the patrons of the motor-car are fewer than were the converts to cycling, and hence makers cannot afford to play with the future of the industry.

Prying and Prejudice.

It would be impossible within available limits of space to enumerate all the localities where police persecution and officiousness hold sway, and an apology is due to those places which, though deserving, have unavoidably escaped mention in these columns. Not a year has passed since the liberal and progressive attitude of Southsea was a determining factor in its selection as a destination for the anniversary run in commemoration of the Act, a choice which was rewarded by a hearty welcome and invitation to repeat the same, which, alas! there seems now to be little temptation to accept. A visitor, writing to the *Southern Daily Mail* a short time ago, complained bitterly of the annoyance to which the police subject the motoring public, while a well-known resident writes to say that he is unable to take out his car with-

out a leash of mounted police following hot on the scent, and compelling him to go at a walking pace if he wishes to avoid the usual penalties—for in such a chase the race is seldom to the swift. It is, by some fortunate chance, not often that the local luminaries of the bench, who are themselves automobilists, occupy an unaccustomed position in court during motor cases; but it would be of local as well as general benefit if they use their influence to limit the efforts to suppress the coming mode of transit, which our holiday resorts, above all other places, would find it to their best interests to encourage.

The Speed Limit.

MODESTY, with regard to any suggestion for removing or altering the speed limit of twelve miles an hour to which automobiles are subject, has always been characteristic of the motorist. It is a notable advance, therefore, when the *Field*—the organ of the horse-owner and country gentleman—declares the restriction to be unnecessarily severe, and urges its abolition on three grounds. Motorists would probably have refrained from the advocacy of such a change, but the contentions of the *Field* must be recognised by all unprejudiced persons as sane and reasonable. "In the first place," says our contemporary, "it is distinctly unfair on this the newest form of locomotion that though the vehicles are capable of being handled and controlled with the greatest ease and precision, they should be subjected to such a restriction. In the second place, the restriction is a vexatious and unnecessary one, inasmuch as no one can form a correct estimate of the speed of a passing vehicle, therefore the evidence proffered, and on which convictions are often obtained, is absolutely worthless. In the third place, there is no call for the restriction when the interests and safety of other users of the highway are amply safeguarded by the law against driving to the common danger—a law which applies to the automobilist just as much as to any other rider or driver. Such a discrimination to the prejudice of one class of traffic savours of persecution, and it is difficult for an impartial observer to take any other view of this arbitrary curtailment of the liberties of one particular type of vehicle, more especially when the propensities to danger it possesses are obviously less than those manifested by other types."

The Tare Limit of Motor-Wagons.

At a meeting of the Nottingham Chamber of Commerce, last week Mr. G.H. Cox moved the following resolution, submitted by the Liverpool Chamber, in reference to the tare limit of motor-wagons:—"That this association is of opinion that in order the better to meet the urgent wants of the commercial, trading, agricultural communities of this country in the matter of additional facilities for the carriage of merchandise and country produce on motor-vehicles, the tare limit now fixed for such vehicles should be raised without delay, in accordance with the representations already made by this association and others, to the President of the Local Government Board." In moving the resolution, Mr. Cox said there might be some disposition to attach but little importance to the subject, but in Liverpool it was a matter of considerable moment to commercial men, because of the necessity of cheapening transport, particularly in regard to short distances, and secondly, because of the development of the trade in motor-wagons, too large a share of which at present went to the United States and France, with a consequent loss to British trade. The tare was at present limited to three tons, and the Government had admitted that in fixing the restriction at that weight they were merely experimenting, but, in spite of all representations, they had refused to increase the tare weight. The result was that the builders were unable to produce a wagon that was strong enough to carry an economical load. The suggestion put forward in the resolution was that the total moving weight should be permitted up to 14 tons, with a maximum weight of 12cwt. per inch of the width of the tires, which should be a sufficient protection for the roads. Mr. B. Plummer seconded the resolution, which was carried without further discussion.

A Public Motor-Car Service in the Tyrol.

A VIENNA firm has recently started a service of motor-cars between Toblach and Cortina, in the Austrian Tyrol, the vehicles used being Daimlers, built at the Austrian Daimler motor works (Bierenz, Fischer and Co.) at Neustadt, Vienna. During the summer months three services a day are run in each direction, the journey occupying two and a quarter hours. Notwithstanding great opposition on the part of the coach and carriage owners in the district, the service has been well patronised not only by tourists but also by the natives, the cars, in spite of the hilly route, making the journey in much less time than the horse-drawn coaches. So great was the animosity of the coach and carriage owners that they inaugurated a boycott on the proprietor of the Hotel Croce Bianca, who, in Cortina, had charge of the sale of tickets for the cars. However, this difficulty has been got over, and the cars are still at work. On another page we reproduce an interesting photo of the arrival of one of them at Cortina.

Motor-Cars v. Tramway-Cars.

In the course of a paper read before the Engineering Section of the British Association at Glasgow, yesterday, Mr. Norman D. Macdonald referred to the competition of trams and motor-cars. The author remarked that in briefly looking at some points under this head, it was necessary to remember that we are in the midst of the revolution which railway men had been warned to be ready for—the competition of electric trams. But very shortly both trains and trams will have a much more serious competitor in the more convenient, swifter, safer (than trams), and handier public service motor car. Indeed he would be bold enough to say that in the city of Glasgow, which with its usual enterprise and energy, has provided itself with a large and splendid system of trams, in a very few years they will be voted as slow, inconvenient, as gross blockaders of the streets, and will be removed in favour of swift automobiles, and some approach to decent street surfaces attempted, as more to be desired in the public interest.

MR. A. C. BOSTWICK ON HIS 40 H.P. WINTON RACING CAR.
[The Automobile Magazine.]

A Fall from Wisdom.

Is the *Morning Leader* suffering from "summer madness?" The concern with which the three halfpenny morning journals of London have regarded the automobile is one of their chief recommendations to many people. And now the *Morning Leader* has strayed from the fold, and expressed the hope that motorists will have to make roads for themselves—just as the railways have done. But, worse than that, our contemporary adds: "We hope the Chancellor of the Exchequer will keep these worthies"—i.e., motorists—"in mind

against his next Budget." Is the writer of that sapient paragraph unaware of the licence fee already paid? Surely it is enough to have to pay that without any special tax being imposed. But it is hardly likely that Sir Michael Hicks Beach will give heed to the suggestion of the *Morning Leader*, for his *Leader* is among the motorists, and many of his supporters incline their favour towards the new locomotion.

Sir H. Thompson's Testimony.

SIR HENRY THOMPSON'S letter to the *Times* of August 27th has been productive of a shoal of correspondence, to which has been added another important letter from Sir Henry himself, in which he deals with the absurd suggestion made by a correspondent that no motor-cars should be made capable of running more than the legal limit of twelve miles an hour. "Had he known anything of the principles of motor construction and driving," says the eminent doctor, "he would have been aware that no car thus limited in power would ever ascend a hill. One cannot have less than sixteen miles an hour in reserve, or the motor driver would, like a cyclist, have to push his machine up the hill. One requires exchange of speed into power, and in order to ascend a steep hill one often climbs at only four miles an hour, if less steep at eight or twelve." But the *minimum* of speed in reserve for all purposes, and there are several, is about twenty; and the rate at which Sir Henry drives on a level, straight, roomy road, where he can see his way well, is a mile in four minutes, producing, with hill climbing, about an average of twelve miles an hour. His car is a 6½ h.p. Daimler *tonneau*, and he drove the other day to Bedford from Hemel Hempstead—about seventy miles there and back—in about 5½ hours, wearing his ordinary spectacles. Sometimes he dons "goggles"—faintly neutral tinted glasses with narrow pale coffee-coloured surroundings.

"No Doubt at All."

So interesting has the correspondence on motor cars become that the *Times* has been well advised to devote a leading article to the subject, opening with the declaration that the motor-car has come to stay. "Of that there can be no reasonable manner of doubt," said the character in a recent comic opera. "We cannot doubt it," gravely writes the *Times*. Summing up the results of the automobile, its social services are rightly recognised and the effect on suburban train traffic, the bringing of Brighton within a day's drive, and the improvement of the delivery of goods and produce are all touched upon. Then follows a mild criticism on the speed question, and the unhappy way in which Parliament dealt with the question in 1896 is referred to. But the point of the article is that which we have always urged, viz., that "the right of all persons using the highway is equal and co-ordinate," and that while drivers of horses must not be too fastidious and too nervous, motorists must show a general consideration for the rights of others. With toleration all round much unpleasantness would never have occurred. We hope the result of Sir Henry Thompson's excellent efforts to defend the automobile will be to convince horse-owners that sweet reasonableness should characterise their action and utterance—as it should certainly be an attribute of the motorist.

"A Daniel come to Judgment."

A PRACTICAL, sensible, Yorkshire magistrate—from whom we shall be pleased to hear—has done an unique thing. Instead of, like so many other magistrates, pouncing upon automobilists with the vigour usually meted out to rogues and vagabonds, he has "with a view to testing for myself the rights and wrong of the matter," bought a motor-bicycle upon which he has travelled about 500 miles in Yorkshire. He passed five or six hundred horses; only two turned round—both young horses that were being broken in—and not more than three or four showed any inclination to shy. He soon discovered that a pace of twelve miles an hour seemed almost intolerably slow, and he—a magistrate be it remembered—actually managed to attain a

speed of twenty miles an hour without murdering a man, woman, for chicken, and without being observed by a policeman. This Yorkshire magistrate now regards it as the duty of horse owners to educate their animals, and declares against the limitation of speed. The rational course to adopt, in his view, would be to punish drivers doing damage or furiously driving, for eight miles an hour is often too fast in a town and thirty miles is not too fast on a deserted highway.

The King of the Road.

"X RAY" contributes to the *Lincoln Leader* one of the most sensible articles on motoring that we have seen for some time in a provincial paper. He rightly differentiates between motoring and motorists. "We have not to consider the mechanism of the motor," he says, "but the character of the motorist. The latter has become, by force of circumstances, the king of the road. Having obtained such a position he should not seek to take advantage of its superiority by ill-mannered conduct and ungentlemanly behaviour."

Aberystwith Wisdom (?)

THE unfair attitude of Dundee magistrates towards enterprising townsmen, recorded in last week's *Journal*, finds a companion picture in the arbitrary conduct of the Aberystwith Council this week. Mr. Hollier has had a licence for the conveyance of the public by motor-car. He has carried many passengers and no complaints have been made. But when he sought to renew his licence the Council decided that he should discontinue running the motor-car after six o'clock in the evening, and that it should only be run for one hour in the afternoon and one in the morning. According to the bye-laws of the town vehicles can ply for hire between seven a.m. and ten p.m.; but now motor-cars are to be restricted to two hours' work in two portions and before six p.m. This is not only arbitrary and unjust, but we doubt its legality. Equity is the proud boast of the British law, and there must be equal treatment for all drivers—whether of motor-cars or horses. We hope Mr. Hollier will be well supported in his plea for fair play.

An Interesting Volume.

MESSRS. HUGUET AND MINART, of Paris, have sent us a copy of the 1901 edition of the "Grand Album Illustré de l'Industrie Automobile" which they have recently issued. The work, which is elaborately got up, is devoted to a review of the latest productions of the leading automobile constructors in France. The left-hand pages are occupied with large-size illustrations of the various vehicles—petrol, steam, and electric—while descriptions of the same are given on the right-hand pages in three languages—French, English, and German. The book opens with a section devoted to some of the principal events in the automobile world in 1900, reproductions being given of photos of some of the most successful *chouffeurs* in last year's races on the Continent, and also of some of the leading members of the French Automobile Club. Another section is devoted to touring, and here again some very interesting pictures are given. Altogether, the work is most attractive; and though its size is rather large, it should form a useful addition to the automobilist's reference library.

THE Crane Cycle and Motor Engineering Works, The Pavement, New Malden, Surrey, are keeping a stock of oil and general motor-car accessories. They are also able to undertake any necessary repairs.

ONE of the latest converts to automobilism is Mr. Horace Mayhew, of Broughton Hall, Broughton, near Chester. He has just had delivery of a new 4½ h.p. genuine De Dion phaeton. The car, which is painted dark red with black mouldings, is a very handsome and exceedingly comfortable vehicle for four riders. Mr. Horace Mayhew, who is a relative of Mr. Mark Mayhew, is Deputy Lieutenant of Cheshire, and no doubt his example will lead to a further increase in the number of automobilists in that county.

The Big Event of 1901.

THE GLASGOW RELIABILITY TRIALS.

(Concluded from page 498.)

THE SECOND DAY.

ON THE LANCHESTER CAR.

On Tuesday my allotted place was upon the Lanchester carriage, but when I reached the storage building about 7.45 a.m. I found that, owing to having arrived in Glasgow only the previous night at a late hour, Mr. Lanchester was not proposing to run. I was disappointed, of course; specially as ever since the Petersham Hill climb, now long ago, experts had been looking forward with high anticipation to the finished product of Mr. Lanchester's genius. It was, however, not a bad thing to have a quiet morning, as these trials are pretty fatiguing, although so pleasurable; and it was arranged for me to have a short drive in the afternoon. We started at 2.30, and pursued the road by which the cars were to return. We got only a few miles beyond the outskirts of the city before we met the stream, headed by the *soi-disant* 16 h.p. Panhard; but the trial, short as it was, demonstrated one of the chief features of the Lanchester construction—that is to say, its suspension on rubber buffers as well as springs. It is little exaggeration to say that one travels over the roughest pavement without feeling it. In the open country for the sake of showing this point we drove repeatedly on to and off a sidewalk, perhaps four inches high. The control of the car, which, of course, is peculiar to itself, makes it very easy and pleasant to handle in traffic. In the car in which I was driven two defects were apparent: the cooling was insufficient and the metal faces of the clutch squeaked; but these are to be remedied at once.

I ventured to say to Mr. Lanchester that I hoped that ere long the carriage would give proof of its ability to stand long journeys and hard pushing as satisfactorily as it stands the conditions of town work. ARUNDELL WHATTON.

THE THIRD DAY.

Owing to having to go to press early, we were only able to briefly refer to the proceedings of the third day (Wednesday) of the trials. The programme for the day was a run to Callander and back, *via* Torrance, Fintry, and Thornhill, a distance of ninety-nine miles and a-half, and a hill-climbing competition. The long twining track which runs from Lennoxtown over the shoulder of Fintry Hill was chosen for the latter test. The start was made, as usual, from Kelvinhaugh Street at eight in the morning, thirty-four cars getting away within a few minutes of each other. The morning was dull and grey, threatening rain. The ascent from Lennoxtown was well begun, but soon the tail lengthened out as the heavy gradient, which rose as steep as one foot in ten at parts, began to tell on the low power vehicles. The test was an extremely stringent one, and several cars which had come through both the previous tests with high marks found themselves wanting on the long and not too carefully metalled road that wound up the bare hillside.

Callander was reached by P1, a 12 h.p. Panhard car entered by the Dunlop Company, at 11.13, and twenty others arrived within half an hour. The run home in the sunshine by Aberfoyle, skirting the borders of the Menteith Moss, was among the most enjoyable of the week. At the very moment of the minimum time car P1 entered the Exhibition grounds, attended by half a dozen others in hot pursuit. By five o'clock twenty-three cars had reached the grounds, and ten more came in before eight. The marks allotted to the different cars for the run and for the hill-climb are shown in the table on another page.

ON THE M.M.C. VOITURETTE.

The casualties of Tuesday further reduced the list of starters for the hill-climbing contest and trip to Callander on

Wednesday, the 11th inst., the total number stopping short at thirty-three. In consequence of so many cars being unable to run from some reason or other, a small crowd of honorary observers and pressmen were left behind, being unable to find seats. As for myself, I was fortunate in being offered a seat in the M.M.C. voiturette, which was not engaged in the trial, but was on some kind of roving expedition that I never understood; anyway, I found it a nice change to be able to stop now and again after having had two days on the milestone-devouring cars, and there was the further advantage that we had the road practically to ourselves, and so escaped the great bugbear to riding in company—dust. The morning was again dull, but as the day wore on the sun got out, and we saw the country through which we passed under every aspect of light and shade.

We did not leave Glasgow until over an hour after the first competing car had left, so saw nothing of the hill trials, though

A GROUP OF OFFICIALS.

on arriving there we heard that the New Orleans voiturette, the two Locomobiles, and one of the Wolseley cars had gone particularly well, as had the De Dion voiturette. Just short of the foot of the hill we came across the remaining Star voiturette drawn up under the hedge side, the bevel gear having gone. At the foot of the hill two or three large private cars were drawn up, one a Delahaye, on which was a distinguished party, including Lt.-Col. Holden. Our own little car tackled the hill well, but as we were not officially engaged in the trial we did not push it to the utmost or time it, but we were well up the hill before we had to call on the third speed.

At the top of the hill we found Mr. Secretary Johnson and timekeepers, with three or four knights of the camera. Just before reaching the summit we passed the M.M.C. delivery van, climbing steadily up with its ton of dead weight, and doing remarkably well, as it did each day. From the summit down to Stirling the hill on the other side is equally steep, and on reaching level country we overtook one of the New Orleans cars pulled up for puncture, but as we stopped for water a little further on it re-passed us. All

this time the views, ever changing, had been beautiful, and Stirling Castle stood out against a perfectly clear sky in bold relief. From the outskirts of Stirling to Callander the road is for the greater part dead flat, and we made many fast miles, but no vehicles were overtaken, which showed us that practically all the cars must have been going well.

Talking of reliability, we made a calculation as to what time the cars would meet us on the return journey, this when we were about eight miles from Callander and travelling at top speed. By

PROFILE OF FINTRY HILL.

Total distance, 3 miles, 7 yards; Total rise, 843 feet;
Average gradient, 1 in 19.1.

calculating our own speed and the pace we knew the leading cars were likely to come at, in combination with a punctual start on their part and official time on our watches, we located the point to well within a quarter of a mile at seven miles from Callander, where twenty-two cars passed us in nineteen minutes, and pretty much in the same order as we afterwards found they had arrived at the Exhibition. On reaching Callander the only cars left in the place were Mr. Cordingley's Napier and the New Orleans, both of which got away some little time in front of us. On the run home from Callander to Glasgow, 48½ miles, we encountered but one car—the Decauville voiturette—just before entering Aberfoyle, a puncture having caused the stoppage. Soon after this our own ignition was bad, and a search disclosed the fact that the solder which fixes the platinum tip had broken away. The tip was still there, but, being loose, it naturally worked intermittently. After fitting a new trembler to the contact breaker we had a splendid run back to Glasgow in something less than official time, the first twenty miles being through typical Scotch mountain country, and all in the car voted this the best trip of the week so far.

On arriving at the Exhibition grounds it was found that the three Panhards were first back, as on the previous day, and that the greatest number of marks in the hill climb had been awarded to the De Dion voiturette, in section I. (131 marks), and to Mr. Exe's New Orleans (155 marks), in section II. The Panhards, De Dion, M.M.C., and Stirling now stand well.

T. H. H.

ON THE "POWERFUL" ELECTRIC CAR.

To-day (Wednesday) I went with the "Powerful." As we were running under somewhat different regulations from those governing the other vehicles, we left a little before eight; and glided noiselessly along at a steady ten to twelve miles pace. Several cars went ahead before the Control, but we gained by being able to go through without stopping. A few easy stretches, a nasty right angle turn between walls, where I feared afterwards to hear there had been some incident, and we were at the bottom of Fintry Hill. The worst pull is experienced at the start; after that it is merely a long steady grind, at no point steep enough to stop any car of modern build. We stayed a moment or two at the bottom to remove the covers of the motors, so as to let the air get to them and keep them as cool as might be. For a part of the distance Mr. Chambers and I walked,

leaving the observer and the driver in the car. Although, of course, the fastest vehicles went by us almost as if we were standing, yet it was about as much as one could do to keep level with the Powerful at a steady trot. We did a mile or more in this way, and then both we and she wanted a breather. The discharges had necessarily been heavy, and the motors were heating. At the end of a quarter of an hour or so we did another spell in the same way, and then rested men and machine once more. The total time taken was fifty-four minutes, and the average pace while moving about seven miles an hour. Considering that the electromobile has to drag a dead weight of one ton of batteries, this performance must be regarded as quite excellent. So we turned the top and began to run down. Here and there we were able to recuperate a little; but in view of the trying road, it had been arranged to go only to Stirling, and there to re-charge. On reaching the plain, therefore, we plugged steadily forward with the grandly-placed Castle and Wallace Monument always growing more distinct before us; and, entering the city, made straight for the electric light station. The voltage, however, was so good that it was decided to risk the return journey without taking in more energy. But we were destined to disappointment; for the meter-hand went back so rapidly that some fifteen miles before reaching Glasgow it became evident that we could not complete the distance. Fortunately, the district about Kilsyth is full of coal mines, and we were directed to one which possessed an electric plant. Here we remained two hours charging off the dynamo; and then, somewhat hungry, but thinking our troubles over, set out again. The off-side motor had been sparking more or less since Fintry, and it was clear that some damage had been done by the intensity of the current passed through it. This accounted for the accumulators not holding out. Things quickly became so bad that drastic measures were required. The electricians of the party discovered a "short," and tried to remedy it by cutting away the binding wire, and by so altering the connections of the fields that the dynamo was generating instead of driving; but it finally became necessary to uncouple the motor on that side altogether, and rely

THE M.M.C. DELIVERY VAN.

upon the other. It was wonderful how it moved the heavy vehicle along: certainly we made better progress than at any time in the day previously, showing that the faulty motor had been doing only more harm than good. The difficulty was that with every movement of the switch sending more power to the one working motor there was, of course, a strong tendency to swerve away to the right; and the plan was adopted of one of the passengers working the switch-handle so that the driver need never take his hands from the steering bar. I was dropped at the Hotel at

10 p.m., having had an enjoyable and instructive day. While recharging, some of us took the opportunity of descending the mine (Drumbeck, I think was the name of it); the shaft of coking coal is one of the deepest in Stirlingshire, and the plant one of the most modern.

ARUNDELL WHATTON.

ON THE CLARKSON AND CAPEL CAR.

The new car entered by the Clarkson and Capel Steam Car Syndicate could not be finished in time for the trials, so a Locomobile fitted with Clarkson burner and return water apparatus

return journey. On Tuesday the car ran to Ayr with one stop for water. The damaged axle again gave trouble and ran hot all the way. The return trip was made without a stop, the pace averaging about twelve miles an hour. It may be mentioned that this is the only car in the trials which ran with paraffin oil.

ON THE 6 H.P. BARDON CAR. (No. 17.)

The special feature of this car is the motor, developing 6 h.p. on the brake, this being of the vibrationless type with only one cylinder, in which work two pistons with the charge explod-

THE 5 H.P. WOLSELEY CAR.

was very kindly placed at their disposal by Dr. Hamilton, of Dartford. Unfortunately it suffered injury in the railway journey to Glasgow, some of the results of which did not at first appear. On Monday the car ran to Edinburgh without a stop for water. Just after leaving Edinburgh a serious leakage of paraffin was observed from a damaged pipe joint, necessitating a return to Edinburgh for repair, and in this way a couple of hours were lost. The driving axle also gave trouble and somewhat impeded the running. Glasgow was reached about 9 p.m. after completing the whole trip, the water tanks were refilled at Lanark on the

ing between them. The car is fitted with an aluminium body and two seats only. After wending our way through the traffic, we arrived at the outward control for Glasgow, where we were detained about ten minutes to allow the leading cars to get off. In stopping at this control, the following car, which was a little close on our heels, failed to pull up in time, and ran into us. Fortunately, no damage was done except the removal of a little paint. Immediately after the start we passed through the village of Bishop Brigg, where the inhabitants had turned out in strong force to welcome the cars. Having successfully negotiated a

canal bridge which was only just wide enough for the cars to pass, we then prepared for the first hill-climb of the trials. The hill in this case was three miles in length, and led up the mountain side after making many awkward turns. Our little car went up at a steady pace of about nine miles an hour—a very fair performance considering the loose condition of the roads. On reaching the summit a good view of the surrounding country was obtained, and a fine run of two miles across the top was slightly marred by a mist, which held the dust made by preceding cars in suspension and made travelling somewhat unpleasant.

A safe descent into Firtry was then made, the road being still loose and with many bad bends; the slope, however, came to

PROFILE OF GLENEAGLES HILL.

Total length, 2 miles, 754 yards; total rise, 422 feet, 8 inches; average gradient, 1 in 30.3.

an end none too soon, as our brakes had started to fire as the bottom was reached and would have necessitated a stop to cool down had we had to use them further. A good, steady, non-stop run was now made to the Callander control, after passing through the pretty village of Doune, where the road led for about two miles through an avenue of trees meeting over our heads.

Both man and car now took in oil and fuel, and on restarting a successful run was made for about fifteen miles, when, after descending a hill with clutch out, our motor failed to restart. After a short inspection the driver located the cause, namely, that one of the battery connections had vibrated off its terminal. This was quickly set right and a fresh start made, but meanwhile three other cars had passed us. Having successfully run a few more miles we were again stopped from the same cause, but this time it was the other wire. The connection being remade, we ran safely into Glasgow without further incident, finally arriving in the Exhibition at 3.30, to find that we were well placed in the line. The motor ran perfectly throughout, and but for the incidents mentioned a most satisfactory and speedy run was made.

R. H. S.

THE FOURTH DAY.

Thursday's programme comprised a run to Stirling (the route covering a distance of ninety-six miles) and a hill climb at Gleneagles. The start was made from the storing hall in Kelvinhaugh Street at the usual hour—8 a.m. The morning was of the brightest description. There was, however, a breeze strong enough to lift the dust which was disturbed by the cars. When about twelve miles from Stirling the wind became palpably stronger and more keen, although the sky was mostly blue and the sun was unveiled. Stirling was reached shortly after one o'clock, and here the cars were housed and the motorists adjourned for luncheon, a restart being made at 2 p.m. Outside of Loaninghead the hill-climbing test began, a stiff 2½ miles, which showed gradients as steep as 1 in 17.4 at parts. The bulk of the cars did better than on the previous day, and one astonishing performance was made by No. 16, the New Orleans vehicle, which did so well at Fintry. The marks allotted it for the feat were 215, an award much ahead of any of the others. The home run proved uneventful save to No. 18, the 10 h.p. Bardon, which broke down at Kirkintilloch so seriously as to prevent it again competing. The first vehicle to arrive at the Exhibition was Mr. Harvey du Cros's Panhard,

which drew up at 3.50. Another Panhard, the 18 h.p. Daimler, the 9 h.p. Napier, and the M. M. Company's big car came in at practically the same time. Within a few minutes ten others had taken up their position, and by seven o'clock the cars were all in with the exception of the Bardon vehicle.

ON MR. CORDINGLEY'S 10 H.P. NAPIER AND THE "C.P.C." CAR.

On Thursday Mr. Cordingley most kindly offered me a seat in his *tonneau*. With agreeable conversation, constant variety of scene and grade, and every comfort in travelling, the morning's drive proved one of the most pleasant of the week. The bulk of the work was done before lunch, and in excellent style. From Stirling I returned in the smaller Milnes car, by the courtesy of Mr. Burford. We had a halt at the outset, owing to the gear wheels which drive the magnets having worked themselves into a wrong mutual relation and so causing premature firing—rather a curious derangement. When this was diagnosed and rectified, the car ran as well as the other which I described last week. The road was that which we had traversed on the "Powerful" the day before.

ARUNDELL WHATTON.

THE FIFTH DAY.

The final day of the trials (Friday) had for programme a run of 115½ miles to Tyndrum and back. The route was probably the most severe of all the trials. It was decided by the judges not to give marks for the Whistlefield hill-climbing test, but the performances of each car might be, if desired, recorded by the official observer. Thirty cars put out from Kelvinhaugh Street in the morning, these including a private Edinburgh vehicle and two other non-competitors. Running easily through the Dumbartonshire towns, the early cars made Garelochhead about eleven, and began the ascent toward Whistlefield. This hill is renowned as one of the worst in Scotland, not only for its steep ascent, which rises for 240 feet at a gradient of 1 in 7.8, but because the sharp bend at the foot makes it impossible to get way on at the beginning. Several cars failed to reach the summit and had to call in manual assistance, and most of them had to shed passengers on the way. Wonderful driving was shown in the run along the undulating zig-zag road by the side of Loch Lomond. Tyndrum was reached about a quarter-past twelve. The home run was made in cloudy weather, but little rain fell until most of the cars were in the Exhibition grounds, the first car to enter being the 18 h.p. Daimler, followed by the 10 h.p. Wolseley and the 9 h.p. Napier. Twenty-three cars had lined up before seven o'clock. On another page is a table showing the marks accorded to the different cars.

PROFILE OF WHISTLEFIELD HILL.

Total length, 1,629 yards; total rise, 297 feet, 9 inches; average gradient, 1 in 16.4.

ON THE LANCHESTER CAR.

The organisers did well to put Friday's route on the last day of the trials, for it was both the most beautiful and the

most exciting. Mr. Lanchester took me on board. The carriage we were upon was geared rather low, and consequently not fast on the flat; but it was with delight that we skimmed along over surface bad and good indifferently, up hill and down, almost unvaryingly at a comfortable but by no means contemptible speed. Through Dumbarton and along the Gareloch the road is more and more charming at every turn. Between Gareloch-head and Whistlefield is the great climb, so severe that at the last moment cars were excused by the Committee from having their performances officially chronicled, unless they should signify their wish. We wanted to see the cars ascend, so waited on the steepest section. The Lanchester went up meanwhile unchecked. As one watched, nothing was more noticeable than the difference made by good and bad driving. Almost at the first one car was allowed to stop in the centre of the narrow road, so as to block

ON A 16 H.P. PANHARD CAR.

On Thursday I was unable to get a mount on any car through the very imperfect arrangements which had been made for the accommodation of the Press. So it was a double pleasure to know that I had a good mount for to-day (Friday). It has frequently been proved that one man's misfortune is another's gain. I had arranged to take this run with Mr. C. Jarrott on the 7 h.p. light Panhard, the little car which had done so well on the other trips, and as this was to be the run *par excellence* of the week it was extremely aggravating to all concerned to find out at the last moment, when the cars were drawn up on the outward control for starting from Glasgow, that one of the wheels had developed a weakness in the spokes, which was deemed sufficient to make it unsafe for the long and

SATURDAY'S SPORTS ON THE EXHIBITION TRACK.

[T. and R. Annan.

the way for another immediately behind. One of the most powerful vehicles for its weight was stopped at the foot through nothing but want of skill. Several drivers allowed their cars to come entirely to rest while they fumbled for their lowest gear, and then they could not pick-up again. One or two ran back; the car which carried the most efficient sprag, a double one, was one of those which did not need it, but went up best. The Renault had a narrow shave, getting its rear wheels into a shallow ditch between the road and a sheer hillside; had it backed a yard further, there would have been some fearful consequences. The Clarkson did come to grief. At last everyone was up, shoved up or otherwise. Then a lovely coast down to Tarbet, where the Lanchester party had lunch and turned homewards. Getting back in nice time, I saw something further of the Exhibition and the arrival of the remaining cars.

ARUNDELL WHATTON.

trying journey before us. This was only discovered at the precise moment that the leading cars received orders to go, and for a moment it seemed as if I was to be deprived of a run for the second time.

But, fortunately for me, Mr. Jarrott is a man of resource, and a moment later we were on the way back to town for the big 16 h.p. Panhard, which, of course, was not entered as a competing car. On arrival at the Dunlop depôt, where the big car was stored, very little time was occupied in filling up the petrol tanks, lubricators, etc., but by the time we got back to the Control the others had a start of 1 hour 5 minutes, and we knew that by this time the leaders would be well away up the Gareloch. Once clear of the Glasgow suburbs, however, it was evident that we were on a car that could move, and that, all going well, we should not for long lack company. Over the rough Glasgow paving and the vile macadam of the suburbs, the car

moved with perfect smoothness and wonderful freedom from vibration, and even with only the third speed in we were making good time.

Fourteen miles from the start we caught up the delivery van, and soon after that the electric car, and then we had some "small adventure" about a mile through Dumbarton. Here we encountered a herd of cattle completely blocking the road, and it took a fairly long "dead slow" to get through them. On seeing a clear way Mr. Jarrott let the car go on, and at this instant the driver of the cattle seeking "some small advancement in the cause of chivalry," or otherwise, thought fit to strike a blow at Mr. W. H. Kingsbury—who occupied the front seat with Mr. Jarrott—with a stout rope which had previously been utilised for driving the cattle. Quick as lightning the foot-brake was down, and W. H. K. was "busy."

Two miles further the "Argyll" voiturette was passed, with a display of air tubes, then, soon after, Mr. Burns' "Daimler," Mr. Creber's "Albion," going slowly, and the Stirling voiturette (stopped for repairs) were despatched to the rear. At 10.28, or a little over an hour from the start, we were at the foot of the hill climb after a sensational run over the switchback road along the Gareloch. The road here is very narrow, with many sudden curves, and nothing but a low stone wall between it and the water. We were now well up with the main body of the lower powered cars, which were struggling up the tremendous Whistlefield Hill, which has some gradients as steep as 1 in 8. The whole hill side was covered with cars of all shapes and sizes, some going up slowly with all passengers aboard, many others being pushed or assisted, and a few stuck altogether. Our time to the top was somewhere about the even three minutes, and though I did not know at the time I afterwards learnt that four minutes had been considered very good time for the competing vehicles. The descent of the other side was equally steep in places, and competing cars were not allowed to pass each other, but we travelled at a pace at which I should have been distinctly uneasy had the driving been in ordinary hands. During the run down we overtook a number of cars in the following order, all proceeding cautiously—Century tandem, De Dion voiturette, Mr. Siddeley's Daimler, Milnes' 16 h.p. C.P.C. car, 8 h.p. Arrol-Johnston, 6 seated M.M.C. wagonette, M.M.C. voiturette, and the 14 h.p. Gobron-Brillié; then three miles further on the flat, the 6 h.p. Bardon and the Decauville voiturette.

At Tarbet, where the road joins the one skirting Loch Lomond, we were only half an hour behind official time from the leading competing car, and here we commenced the most picturesque part of our journey—lake and mountain vieing with each other in adding beauty to the scene, though unfortunately Ben Lomond and the surrounding heights were veiled in mist. The road on this stage is so narrow that no two vehicles can pass, so when we caught up the No. 19 Locomobile just outside Ardlui at 11.45, and the Wolseley a little farther on, our onward progress was barred. At Crainlarich we once more got away, and from here to Tyndrum the turning point in the journey, the road was one continuous climb for over five miles, but on top speed we simply flew along, though the beating of the engines slowed down to a low point once or twice. The first cars to get through to Tyndrum were the 18 h.p. Daimler, Mr. Du Cros' Panhard, 10 h.p. Wolseley, the Dunlop tired 12 h.p. Panhard, and the No. 16 New Orleans. We arrived about 25 minutes behind the leading car.

During lunch we had a smart shower—the first of the week—and this was welcome, for it made the return journey pleasanter by settling the dust. We started on the run home at official time (1.30), getting away in front of the first competing car, and in the run down to Tarbet, met several of the late comers, the Albion, the Argyll, Mr. Burns' Daimler, the Stirling, the Renault, and the M. M. Co.'s light carriage, the latter being only two miles from Tarbet on the outward journey. This was a magnificent run, the sun having come through and lighting up the ever-changing mountain view, whilst our speed was exhilarating to a degree. We reached

Tarbet, 20½ miles, by 2.23, and there had a pleasant 30 minutes' wait for the first of the competing cars. The first three to arrive, all within a minute or two of official time, were the 18 h.p. Daimler, Mr. Harvey Du Cros' Panhard, and the 10 h.p. Wolseley. The Dunlop-tired Panhard punctured at eight miles from Tarbet, and a new air tube was fitted very smartly in something under five minutes. We next overtook the New Orleans busy with tires, and soon after we stopped to inspect one of our own for suspected puncture, but found all well and made the rest of the run in very fast time over a fine level road along the side of Loch Lomond to Dumbarton, and so to Glasgow. During this period I ceased taking notes of vehicles passed, but we passed all but the first two, the 18 h.p. Daimler and the 7 h.p. Panhard which were first and second respectively to arrive at the Exhibition.

T. H. H.

THE END OF THE TRIALS AND AFTER.

Saturday morning's scene at the Grand Hotel, Glasgow, was just as lively and brisk as on other mornings, but the hour of excitement was somewhat later. The coffee-room was, however, full up by eight o'clock, the judges having their labours to complete, the competitors their cars to attend to, and all something or other to occupy their time. The early part of the day was a dull one, and the prospect of the procession seemed somewhat remote. However, after midday the sun shone, and the afternoon proved gloriously fine. The judges not having completed their task and many cars having left, only twenty-two vehicles took part in the procession through the town and to the racing track in the Exhibition grounds. There were to be all sorts of competitions, and what appealed to the majority most was the offer of a prize for the handsomest and best designed vehicle. All sorts of guesses and bets were made, but none of the wisecracks spotted the winners. Several thousands of sightseers were gathered around the track, and as the cars paraded much cheering was indulged in. The cars were left stationary on the cinder track, while the skill competition on the grass centre and the races on the outer banked asphalted surfaces took place.

For the skill competitions the vehicles had to be driven backwards and forwards through narrow passages, and the winner was he who drove his car in the fastest time without touching the obstacles. There were three entries; the Gobron-Brillié won both heats, the little Renault and the Stirling Parisian phaeton being second and third respectively.

The next event was a race between Mr. Moffatt Ford in a Decauville and Mr. Heard on a Century tandem. The former got away first and was never approached, lapping the Century about half way, when that car gave up. The time was 10 min. 26 1-5 sec. A race between two Locomobile steamers promised to be exciting, and was extremely so, the crowd cheering wildly when the competitors passed each other. At about two miles Ginder was leading and ultimately won, the other steam car stopped, through some mishap. Time, 10 min. 21 3-5 sec. Two or three big cars then ran round the inner track for a few miles, after which the final and most exciting event of the afternoon took place, viz., a race between Mr. Moffatt Ford on his Decauville and Mr. Ginder on a Locomobile. The distance was two and a-half miles. The steamer immediately jumped away and got a twenty yards start, which took Mr. Ford on the petrol car several laps to regain. This he did, and after a severe struggle managed to obtain the lead, which he held until nearing the finish, when Mr. Ginder, who had a reserve of steam, managed to spurt, arriving home the winner by a few feet. The winner was much cheered, and Mr. Ford also received an ovation for his plucky riding. Time, 5 min. 5 2-5 sec.

A short interval, and then a flag was seen flying on the Mo-car with six passengers, denoting it as the winner of the prize for the smartest turn-out, the second highest number of marks also being received for the four-seated Mo-car. The result was unexpected by the other motorists, but being sportsmen they genially joined in the applause. It appears that the system adopted of determining the winner was by handing the occupants of the grand stand a voting paper, and of these 229 were

returned. No. 35, the winner, was the six-seated Mo-Car; finished in natural wood, with brass hubs; two passengers seated forward, two, including the driver, in the centre, and two in the rear, with their backs to the driver. The number of votes received was ninety-three. The second car, made by the same firm, received thirty-six votes. Cars Nos. 20 and 19 received nineteen and seventeen votes respectively. These cars were the Locomobiles, which were profusely decorated with flowers. The other cars which received votes are given below:—

No.	Cars.	No. of Marks.
28	Argyll Voiturette.....	8
30	De Dion Voiturette.....	7
A 4	Mr. Cordingley's 10 h.p. Napier.....	5
10	Wolseley 10 h.p. Car.....	5
37	Stirling 4½ h.p. Parisian Phaeton.....	5

A 10	Mr. Whytlaw's Mo-Car.....	2
A 6	Mr. Creber's Albion Car.....	1
29	Parr 5 h.p. Car.....	1

On view were some of the handsomest cars in the kingdom, so that those who awarded their favours had plenty of choice in the matter. A return was shortly afterwards made for the storage yards, where some of the cars immediately commenced to disperse and by midnight the "Grand" was nearly empty and all "sleepers" for the South were full.

Some few, however, postponed their departure till the next day and of these were Mr. Pedley, with an 18 h.p. Daimler; Mr. and Mrs. Siddeley, on their 12 h.p. Daimler, and Mr. Cordingley and party on their 10 h.p. Napier. Punctually at nine the cars were all outside, but as it was raining in torrents the start was delayed half an hour. The rain in the meantime having ceased, the two last mentioned parties started and Mr. Pedley followed shortly after. Having only seventy miles to go for lunch it was determined not to hurry—but, *c'est l'homme qui propose et Dieu qui dispose*. After going a mile or two, one of Mr. Siddeley's burners blew out and we went on—subsequently taking a wrong turning. The zone of the recent shower was passed almost before leaving Glasgow, and in place of the rain was a hurricane of the most vicious dust we have ever encountered. We went through the 1,000-miles trial last year, and were also present at the meeting of the Municipal Engineers at Leicester, and at other events where cars have congregated on dusty days—but never were such furious clouds of dust felt before. The wind slowed the car and the dust blinded and stung us. So great was the inconvenience felt that the writer had to tie a veil twice round his face. To talk about cars making a dust we feel would be ridiculous after this experience, for we do not believe all the cars in Christendom could create such a whirlwind.

After passing through Hamilton a change came o'er the scene, spots of rain beginning to lightly fall, creating amusing streaks on our faces. These spots gradually merged into a blinding storm and as the car was "pulling" abominably we were in anything but a happy frame of mind. Crossing the Lothian hills, the rain continued, and on some of the highest points it was like hail, cutting into our faces like knives. The cold was also intense, and wrapped up as we were it was still keenly felt. It took us two hours and forty minutes to do thirty-two miles. Having passed the Lead Hills (local appellation) we gladly welcomed the sight of the inn at Abington for a pull up to examine the cause of our engine pulling badly. Here came out Mr. Baron, of Manchester, who informed us he was in company with Mrs. Baron on a Parisian Daimler, with friends on a De Dion voiturette. This latter was *en panne* from ignition troubles. It had taken the two cars since Thursday to travel less than forty miles. Excepting the De Dion, all the troubles had been with the tires, very bad luck indeed having been experienced.

Regarding the motorists who started with us, we were of

opinion that they must have reached Lockerbie, and, therefore great was our surprise when Mr. and Mrs. Siddeley drove up two or three minutes afterwards. They had gone through Motherwell, two or three miles out of the way, and had suffered from burner troubles. While talking, the little yellow 7 h.p. Panhard dashed by, travelling at a fine pace. Our friend's car also went on, we following, having imagined we found our troubles in the petrol supply pipe. Our progress—it was downhill—seemed merry enough for a few hundred yards and we kept the two cars in sight, having wild hopes of being able to catch up to them. Never were hopes more vain, or ambitions more doomed to disappointment. Crawling commenced again; the ignition tubes were changed and changed and changed continually, at least a dozen times; we were carrying a good supply of ignition tubes, but no better results followed. Directly anything approaching a hill was encountered, the car almost and ultimately did stop on every rise. The rain had recommenced at Abington, and if possible continued worse than ever the entire remainder of the journey. As the Moffatt Hills and Beattock Rise had to be crossed, our misery can be imagined, effecting changes of ignition tubes, in the pouring rain, on some of the highest as well as the lowest hills. The car was standing stationary at one point, our "bonnet" in the road, our tools scattered, the rain driving—if it had come down straight, it would not have been so painful; not a sign of life anywhere—but suddenly was heard the loud sound of a motor horn. Immediately afterwards, scarcely having had time to clear our tools away, Mr. Rolls dashed by, going at a tremendous speed and unrecognisable, except to those who knew the car. The swish and splash from the wheels left a good impression behind. No sooner seen in sight, a wave of the hand, and then lost to view—such was our meeting. Continuing, we had a painful, and what might have been a fatal experience. The car still slackened in speed, and finally it would not move at all. Bonnet off again, ignition tubes once more examined, tested, and found all right; other parts were then looked to, and it was ultimately discovered that the engine was not getting any petrol. The pipes leading to the motor were being taken off, when a horse and trap containing three passengers and coachman driving, were seen approaching. The turn-out was a smart one, and as the horse approached it became very restless, and when right opposite the car, suddenly turned into a loose stone hedge, knocking the stones over, turning over sideways, and, with the trap and coachman, fell into the field beneath, a distance of eight or nine feet. A passenger rolled over and appeared to fall under the horse. Our hearts were in our mouths, and for a moment all were terrified, but quickly relief came when it was seen all four were safe and apparently unhurt. The horse was quickly got on to its feet and found uninjured, the trap, too, having escaped with but little damage. The occurrence was a providential escape, for which we were thankful. All things come to an end, and our journey of seventy miles ultimately did by our reaching the King's Arms at Lockerbie at 4.45. A warm welcome was afforded us, and what was equally comforting was warm clothing and the sight of a bright fire—which with the aid of a good dinner—for we had not tasted food since eight o'clock in the morning—soon put us right—although we arrived in the middle of the drenching rain, soaked through, and with our complexions anything but their natural colour. Our first enquiries were after our friends. We learnt that Mr. and Mrs. Siddeley had arrived just before three, and had left about ten minutes before our arrival. Of Mr. Pedley we heard nothing, so we presumed he had gone on—therefore great was our astonishment when shortly after five Mr. Pedley drove up to the door of the inn. It was still raining, and our friend was indeed wet. There is no superlative in the English language to express the state of moisture he was in. He, like ourselves, had had trouble with his ignition—a magneto arrangement—and had not tasted food since breakfast. He would not get off his car for fear of disturbing the pond—or, rather, lake—in his lap, and so proceeded south, with better luck, it is to be hoped, than he had had. Shortly after the sound of motors was again heard, and this time the arrivals were three Panhards, a 16 h.p., a 12 h.p., and a 7 h.p., the drivers being the two Messrs. Du

The Glasgow Reliability Trials.

TABULAR STATEMENT OF RESULTS.

* Optional. No marks are allotted, but the speed of cars and number of passengers carried are recorded at the request of competitors.

† N.B.—Minimum number of Passengers carried.

* No speed in excess of 12 miles per hour, i.e., the legal limit, are published.

The marks for hill-climbing are calculated by the following formula—
Speed in miles per hour X Number of Passengers carried X 1000.
Price of Car

Cros and Mr. Jarrott, with passengers. They had left Glasgow before ten in the morning, and had troubles with tires and ignition. The "twelve" was using lamps. No sooner had we entered the coach-house than in came Mr. Baron—whom we had met at Abington—on a Daimler towing a DeDion, with ignition all wrong. It was a bad day for electric ignition, and perhaps one possible supposition is that the wet had something to do with it. Examining the Dunlop tires on the Panhard, we were pleased to see what little sign of wear they showed, indeed there was scarcely a mark on them, and they had been ridden from London to Glasgow, round the trials, and on to Lockerbie. The number of punctures, we were informed, had only been three. The Panhard party only stayed for a meal, but the other folks remained all night—as we did—and left at four o'clock next day, having been industriously at work since six in the morning.

On Tuesday we renewed our journey South, intending to make first for Carlisle, 25 miles. Having only less than two gallons of petrol in our tank, it was doubtful whether we should be able to do so. Hearing, however, that Dr. Logan, of Ecclefechan, owned a motor-car, we drew up at his charming place and were extended every courtesy. The doctor owns a Mo-car, and has had it six months; he has ridden twice to London and back on the car, which has not cost him a penny for repairs; and as regards troubles on the road, he has not been stopped ten minutes on it. Reaching Carlisle—the road having been somewhat sticky and heavy in places—we noticed on entering the town, a Delahaye by the side of the road; it was laden with luggage and petrol tins. On the other side of the road, Mr. Friswell, with his German car, was at work filling his tank. In subsequent conversation, he informed us that he had been holiday-making at Oban, and had ridden on Sunday from that place to Edinburgh, a distance of 160 miles. The roads were over mountains and through passes, and in more than one instance the car had to be assisted in its progress by the passengers. We also learnt that Mr. C. Johnson, the previous day, had had a collision with a milk cart, resulting in the breaking up of one of the wheels of his New Orleans.

Our original intention was to proceed to Richmond in Yorkshire to spend the night, but yielding to Mr. Friswell's invitation we arranged to travel together to Kendal and Keswick. The eighteen miles to Penrith, although of a switchback character, were over good roads, but after Penrith in the journey over Shap Fell the roads were found in a very loose condition, and we feared for our tires. Nothing noteworthy took place except that portions of the descent were somewhat greasy. We have omitted to mention that at Carlisle we learnt that Mr. Baron and party, again towing the De Dion, left that town about nine o'clock the previous evening with the determination to go straight through to Manchester. Great, then, was our surprise to see the same party picnicking by the roadside within three miles of Kendal. We wonder if they have yet reached Manchester, and, if so, by what means. Mr. Friswell, who had waited for us several times, suddenly found his car stop dead within half a mile of Kendal. After a lengthy examination it was found that the magneto-electric ignition arrangement was at fault. While Mr. Friswell and friend busied themselves on the car we went on to order luncheon, and while waiting for this meal Mr. and Mrs. Manville, on their Daimler, appeared in sight. They had left Glasgow on Saturday morning, and did, we were informed, a non-stop run to Carlisle, a distance of close upon 100 miles. They had been staying at Keswick, and were proceeding to Blackpool. Our friends being unable to continue, we proceeded about five o'clock on our journey, subsequently stopping the night at an hotel at Windermere. Having within the last few days ridden round Lochs Lomond and Long, the Garloch, etc., the difference between the English and Scotch lakes appeared most marked. The Scotch mountains surrounding the lakes seemed stern, terrific, and grand, frowning down on the smallness of the earth beneath them; while the English lakes appeared gentle and sweet, the hills seemed clothed with verdure as if for the purpose of protection. A great contrast, indeed; but, oh, how beautiful were both!

Wednesday broke gloriously, the sun shone brightly, and it was indeed pleasant to wake up and gaze over Windermere on to

the beautiful hills beyond. We thought the hotel at Tarbet, overlooking Loch Lomond, was pleasantly situated, but the hotel at the Waterhead was also charmingly placed. The ride last week to Tyndrum was also a revelation, but so also was the sixteen miles between Ambleside—cosiest of towns—and Keswick, past Grasmere, Thirlmere, and then finally Derwentwater, so different to the Scotch lochs. Between Ambleside and Keswick Dunmail Raise has to be crossed. It is said that from the top eight lakes can be seen; we, however, saw only one, although the sun was shining brightly. It was, none the less, a bright scene, and the run down—although circuitous and with sharp corners—was much enjoyed. About five miles from Keswick, around a turn, is a loose five-barred gate, with an almost obliterated paper notice stating that the road was stopped owing to the rebuilding of two bridges. There was no notice giving directions, and the only turning was a narrow lane, scarcely wide enough for the car to go through. Along this, winding and turning, as in a maze, for a space of over half an hour, we travelled. One of the ladies suggested that the lanes reminded her of Devonshire, but we had never in that fair county met anything so bad; the hills were shorter and sharper, and the surface was worse. As luck would have it, we met a coach and four coming in the opposite direction, and what to do for a minute neither party seemed to know. The difficulty was, however, solved by our driving into a field. To make matters worse, a little further a posse of men were digging a hole in the middle of the road, and to manœuvre by this required some skill. Coming out of the lane we came on to the Penrith road, with a milestone—"three miles to Keswick"—in front of us. It did not state in which direction, and as we had been twisting about so much we were unable to tell. Naturally there was not a soul about; there never is when one is in doubt. However, we took the right direction and safely landed at the head of Derwentwater, in Harker's Hotel, Portinscale, where we stayed the night.

NOTES ON THE TRIALS.

On the first day of the trials Mr. Rolls was unfortunate enough to break a piston. This he had repaired by the Hozier Engineering Company, of Glasgow, and he was at work on his car till midnight on Saturday, to enable him to return south on Sunday. Mr. Holder was unlucky enough to have two tires burst beyond repair on his Napier, and so he was put out of the contest. In his second car (steam), driven by Mr. R. Bird, he was also unlucky, a tube having burst.

THE two Lanchester cars, which arrived late at Glasgow, and were not competing, both went up Whistlefield hill with full number of passengers on. The luggage van of the Motor Manufacturing Company, which ran so well during the trials, also went up Whistlefield Hill, as did the Daimler car driven by Mr. Critchley; the Milnes, driven by Mr. Hankinson; the Decauville, driven by Mr. Moffat Ford; the New Orleans, with four passengers up, driven by Mr. Johnson, and many others. A number of cars had no chance of getting up owing to the hill being blocked. In backing, to endeavour to get a clear run at the hill after being stopped, Mr. Clarkson, on his steam car, and Mr. Burford, on a Milnes, had a collision, resulting in one of the former's wheels being buckled.

MESSRS. ORMISTON AND GLASS had a van, with a great golden dome on the top, running along the route of the trials last week. The way this van ran about was a marvel, and we should imagine its pace must have been at least eighteen miles an hour.

THE Wolseley Tool and Motor-Car Company, Limited, write pointing out that we omitted to mention last week that their car (No. 10) obtained the full number of marks on the first day's run of the trials. It is hardly necessary to mention that the figures given last week were preliminary and hurriedly obtained. The official statement is given in the table in another part of the present issue.

CORRESPONDENCE.

ELECTRICAL IGNITION MATTERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“Rooinek,” although perhaps an electrician, is not sufficiently well versed in coil construction to criticise the system used by De Dion. I venture to state, without trying the experiment, that the wiping contact to “do away with flimsy and costly platinum,” would decrease the volume and length of spark by at least fifty per cent. The two factors for the most efficient working of a coil as far as the contact breaker is concerned are these:—The period of contact must be long enough to thoroughly saturate the iron core with magnetism, and the break should be as quick as possible. Now any metal that has a low fusing point if used for the contact breaker at the points of make and break is locally fused and vaporised by the spark. The length of the spark at the contact breaker and consequently the period of time it takes to break the primary circuit is increased because the vapour of the metal enters into the arc and makes it a better conductor. Platinum, therefore, is used because it has the highest melting point and consequently is the least volatile of any metal used commercially. In my opinion, the De Dion system of electric ignition is far and away the best in use at present.—Yours truly,

E. E. BROADBENT.

THIRD PARTY INSURANCE RISKS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of August 10th, in the correspondence columns, you inserted a short letter from me mentioning that I obtained my insurance from Mr. Callard, etc. It has come to my knowledge that it is illegal for lawyers to advertise, and that this might be taken as a kind of advertisement.

I should like it known that Mr. Cuthbert Callard, of 25, Golden Square, Regent Street, had nothing whatever to do with the letter I wrote in answer to “H.G.E.C.,” re third party insurances, in your issue of August 10th, nor did he know I had written it, nor did I even ask his consent. It appears that some malicious persons might take it as an advertisement, though how I do not quite see, and even if it could be called one, I am afraid I was so ignorant as not to know that lawyers might not advertise.—Yours truly,

J. REGINALD EGERTON.

BODIES FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one who takes a very keen interest in motors, it has often struck me what a very desirable thing it would be if some of our motor and carriage manufacturers would make a point of showing at one of the exhibitions the different stages in connection with the manufacture of the bodies for cars. I have been to nearly all the exhibitions, but have not noticed that any attempt has been made to do this. Now, a large number of people who are now looking at motor-cars with the idea of purchasing are quite ignorant so far as the motor of the vehicle is concerned, but as many of them have their own carriages they consider themselves judges of carriage work. Therefore, when, as now, so many motors are apparently similar, I should think it would be well worth the while of any firm to show the bodies they fit to their vehicles in the different stages of the construction, as whilst I am afraid we must admit that we have hardly overtaken the French in regard to the excellence of their manufacture of motors, yet still as carriage builders we are reckoned better than other countries. No doubt if the attention of the trade were drawn to this matter, it would lead to special efforts being made for the exhibition of motor bodies.—Yours truly,

GEO. E. WILLSON.

THE TWIN TIRE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having seen an inquiry in your issue of the 31st August as to the working of the twin tire, I may state for the information of your correspondent that I purchased a pair of

Collier twin tires in the middle of June last, and had them fitted to the back wheels of my Locomobile car, which has been running with these tires for long distances ever since. I have had no trouble with the tires, and in fact I find that on rough roads I can travel at least half as fast again.

All rubber tires skid on greasy asphalt and tram rails and sets, and I do not find that the Collier tire is any different in this respect. When there is a greasy surface the car must be driven carefully, just as in the case of a bicycle. I had the misfortune to pick up a $2\frac{1}{2}$ inch nail, which went into the tire at right angles for two-thirds of the length. The tire itself sustained no damage from this, other than the puncture of the inner tube. This was repaired, and the car has run ever since without anything having been done to the outer tire. Although the tires may seem expensive in the first instance, they will, I think, repay the outlay, as little subsequent trouble need be feared.—Yours faithfully,

ARNOLD E. WILLIAMS.

A SUGGESTED CLUB FOR MOTOR BICYCLISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having read Mr. R. J. Cholmeley's letter, I fail to see that my idea has been anticipated by the formation of his Automobile Sporting Club, for Mr. Cholmeley advocates that motor cyclists should arrange their runs with motor-car owners and ordinary cyclists, while my ideas on this are clearly set out in my previous letter.—Yours faithfully,

T. UNDERWOOD.

THE GLASGOW RELIABILITY TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It may perhaps seem ungenerous to criticise the manner in which the Automobile Club has carried out the reliability trials recently concluded in Glasgow, but I cannot help protesting against the serious error in judgment which the Committee made in abandoning the contest up the famous Whistlefield Hill, which should have taken place during the course of the last day's journey; for I take it that the awarding and publishing of marks both for reliability and hill-climbing powers was intended to provide the public with definite facts concerning the efficiency of the various cars, and so enable prospective purchasers to choose the type most suited to their requirements. But by the abandonment of the Whistlefield Hill climbing contest, after publishing the figures for the two easier ascents negotiated on the Wednesday and Thursday, the information afforded to the public has been rendered incomplete and misleading.

A comparison of the actual performances of two cars, which I will call A and B respectively, will clearly illustrate my meaning. Both cars are entered as carrying four passengers, and as a result of Thursday's contest up Gleneagles Hill, A, which travels the $2\frac{1}{2}$ miles at $12\frac{1}{2}$ miles per hour, scores sixty-one marks more than B, which travels up the hill at the rate of ten miles an hour. This gives the idea that A has hill-climbing powers vastly superior to those of B. That such an inference may be drawn is proved by the reports of the trials in the Glasgow papers, one of which, published on the day after the Gleneagles Hill climbing, reads as follows: “... One astonishing performance was made by—(A), which did so excellently at Fintry. This car, it is unofficially stated, maintained a speed of nearly twenty miles an hour on the hill. The marks allotted it for the feat were 221, an award much ahead of any of the others.” The public thus obtain an exaggerated notion that A is vastly superior to B in hill-climbing capacity; a notion which would have been corrected if the original intention of holding a contest up Whistlefield had been adhered to.

As an “unofficial” eyewitness I noticed that when A reached the first sharp rise in the last mentioned hill three passengers jumped out, and instead of being carried up the ascent by the car, actually assisted its progress where the gradient was steepest. B, on the other hand, carried all its four passengers up the hill without hesitation and by the motive power of its engine. If marks had been allotted for these performances A would not have received an award so much ahead of the others, as on the previous day. No doubt, in making the final

award, the performances of the various cars on Whistlefield will be taken into consideration, but in the meantime I cannot help thinking it a mistake, since first impressions are often the deepest and most lasting, that figures dealing with the hill-climbing performances should have been published, under the authority of the Club, which do not afford a true idea of their all-round capacity in this direction.—Yours truly,

R. H. CARLISLE.

THE LISIEUX ACCIDENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "Automan," in his paragraph referring to the Lisieux accident, has fallen very wide of the truth; and it would be quite as well if, before rushing into print in the manner he has done, he made some enquiries. The real facts are as follows. The Comte de Villeroi and his son were driving into Lisieux (the car being driven by his son). When nearing the "Octroi" one of the men came out and deliberately placed himself in front of the car, holding up his hands. The son avoided him by steering to the left, and still the stupid fellow repeated it again by rushing in front of the car. This time it was impossible to avoid an accident, and the unfortunate man was killed.

The son immediately pulled up, but the fury of the people was so wild—brandishing sticks, umbrellas, and hurling stones at the car—that the Comte de Villeroi told his son to drive on, thinking it wiser to do so when he saw he could not help the unfortunate man, as you will allow a very wise course, particularly when one knows how little reason rules the French mob when once roused.

As to the inability of the authorities to trace the automobilist, your correspondent is wrong again, for immediately the Comte reached his château (the same night, by the way) he wrote to the Procureur of the Republic at Lisieux and explained the whole case. Add to this, that he has paid over to the man's widow 50,000 francs voluntarily, I don't think anyone can have much to say against him.—Yours truly,

AN OCCASIONAL MOTORIST IN FRANCE.

P.S.—The facts are from the lips of the Comte de Villeroi himself.

AT the conclusion of the Loch Tay Regatta and sports, held at Kenmore last week, a vote of thanks was accorded Mr. Midgeley, of London, whose motor-cars were run during the afternoon for the benefit of the club.

THE Petroleum Institute, of 26, Bevis Marks, London, E.C., which exists for the training of gentlemen in every branch of science relating to petroleum, announces a course of lectures dealing with the various stages through which petroleum passes, and its application, commencing in October next.

WE are pleased to be able to state that Major Craddock, who has been lying at Red House, Doncaster, since the motor-car accident a month ago, was removed to his brother's house at Wemmergill, Middleton-in-Teesdale, on Saturday last. Colonel Craddock superintended the arrangements, and the patient was put on a special train at Adwick-le-Street.

MOTORISTS who assisted at the annual meeting of the Incorporated Association of Municipal and County Engineers recently held at Leicester may be interested in hearing that a "souvenir" of the occasion has now made its appearance. The souvenir takes the form of a neat little book published at the *Guardian* Office, Leicester, which gives a full report of the proceedings, not forgetting the motor-car trips.

MR. DOOLEY, the American humorist, has been dilating on the dangers of "Mr. Hankerbilt's five hundred power autymobile, Purple Assassin." According to this veracious chronicler, "many iv th' people of Newport ar-re talkin' iv havin' a law passed compellin' pedesthreens to ring a bell an' blow a hor-rn on their way to wurruk. Otherwise there won't be a whole tire left in Newport."

THE EASTMEAD-BIGGS VOITURETTE.

WE are this week able to publish a description, with illustrations, of a new voiturette which has recently been put on the market by Messrs. Eastmead and Biggs, of Frome, Somerset, and 32, Green Street, Blackfriars Road, S.E., and which comprises several points of interest. The engine, which is located under an unobtrusive bonnet in the front of the car, is of 78 mm. bore and 20 mm. stroke, and

FIG. 1.—THE EASTMEAD-BIGGS VOITURETTE.

develops $3\frac{1}{2}$ to 4 h.p. It is fitted with the Simms-Bosch magneto ignition, with variable timing gear and inlet valve closer. The engine is carried by brackets on the longitudinal tube LL, which connect the front and rear axles, and are shown in Figs. 2, 3, and 4. These longitudinals, which carry all the gearing, are provided with enlarged bosses, turned true in the lathe, so as to secure the absolute alignment of the parts that fit thereon. At the rear end of the longitudinal tubes they are spanned by two stretcher bars KK, in which are formed bearings in which the trunnions TT, or the differential gear box G, can turn. This allows the rear axle to be lifted at either end by inequalities in the road, or obstructions, and as the transmission shaft S is co-axial with the trunnions

FIG. 2.—PLAN OF FRAME.

THE ARRIVAL OF ONE OF THE CARS AT CO. TINA.

(Aus der Zeitungs-)

Cliche der

CONTINENTAL NOTES.

By "AUTOMAN."

SINCE M. de Crawhez demonstrated the possibilities of the motor-car as a substitute for the caravan in North Africa by travelling from El Biar to Laghouat, a journey of 448 kilomètres, usually undertaken with a train of fifty beasts of burden, three unsuccessful attempts have been made to emulate his example. Success has, however, crowned the attempt recently made by M. and Mme. Jacques Lefebvre, who covered the desert route in three stages. From El Biar to Boghari, 166 kilomètres, in seven and a-quarter hours; Boghari to Djelfa, 153 kilomètres, in eight and a-half hours; and from Djelfa to Laghouat, 129 kilomètres, in six and a-half hours; the total time for the 448 kilomètres being twenty-two hours and a-quarter.

THE St. Petersburg police have issued orders that the speed of motor-cars within the city must not exceed twelve kilomètres (7½ miles) per hour, and must be still further reduced on turning corners. The penalty for infringing this regulation is a fine of 500 roubles—or three months.

It has frequently been our pleasant duty to chronicle the deeds of motorists who, by placing themselves and their vehicles gratuitously at the disposal of others in distress, have brought about results otherwise unattainable, or if attainable only at a loss of much all-important time. Such an event occurred a few days ago in Paris. Count d'Harvey had just left his carriage, a phaeton drawn by a smart pair of cobs, to speak to a friend on foot in the Champs Elysées. Suddenly he heard a noise of rapidly departing hoofs, and looking round saw a stranger coolly driving off in his phaeton. A big motor-car was at a standstill hard by, and the count had a brilliant idea. He ran up to the automobilist, hurriedly stated his case, and added, "Do you think you could catch up my cobs?" The owner of the racing car answered with a smile and a request to the count to get up beside him. The automobile was started at top speed, and in a few seconds the smart pair of cobs and the thief who was driving them were overtaken, and the man was handed over to the police. Meanwhile the motorist had to depart, as other policemen on bicycles were looming in the distance, obviously bent on arresting him for having driven down the Champs Elysées at fifty miles an hour.

THE Queen of the Belgians has lately taken to the automobile, and has become most enthusiastic about the sport. Her Majesty, who is now at Spa, is often to be seen in her motor-car driving about the neighbourhood.

PARISIAN automobilists who are still discussing the *pros* and *cons* of every available site near Paris suitable for a motodrome have been agreeably surprised this week by the announcement that the Municipal Council of Issy-les-Moulines have a scheme for placing the well-known manoeuvring ground of that locality at the disposal of a company willing to construct the desired course. The consent of the military authorities would, of course, have to be obtained, but it is believed that little or no opposition will be met with in that quarter, as the formation of the motodrome would in no way detract from the parade ground on which the garrison of Paris is wont to evolute.

BOTH good and bad fortune seem to dog the footsteps, or should I say the wing path, of M. Santos Dumont. Bad fortune, because through a trifling accident he has damaged his No. 6 again, and postponed his run for the Deutsch prize; good luck, because again he has had a narrow escape of personal injury and came off scot free. On Thursday last week, although not quite completely inflated, the new air-ship, which has taken barely three weeks to complete out of the wreck of No. 5, was tried as a captive for the first time, and gave such good results that the following day the bands were loosened, and it took to the free air literally like a bird. For several hours at Longchamps it sailed over the racecourse, evolving perfectly and travelling both with and against the breeze at a greater speed than No. 5, and with a marvellous precision. To break the monotony M. Santos Dumont shouted to his friends a *rendez-vous* at the Café de la

Cascade. He flew to this well-known restaurant, and landed lightly without any difficulty on the lawn in front of it, and amidst much merriment had his photograph taken with two policemen just in the act of writing down in their note-books a supposed *proces verbal* against him for flying furiously to the public danger, and then he set off home. In passing over some high trees, however, his guide rope caught, and there he remained a prisoner in the air for a considerable time until someone climbed the trees, but all to no purpose, and the navigator was forced to let out some hydrogen and come down. Strangely enough, it was again in the Baron Rothschild's property, and, there amongst the trees, there was the greatest difficulty in extricating the machine, and hours were spent in getting it back to its home. There remained the Seine to be crossed, and as the balloon in its damaged condition could not be trusted in the free air it was taken to the bridge at Suresnes, where with the greatest difficulty it was made to avoid the telephone, telegraph, and trolley wires, chimneys, etc., etc. At last the park of the Aero Club was in sight. M. Santos Dumont, still in the basket, threw out some ballast, and shouted orders to his assistants. In the confusion the orders were misunderstood, the men in front let go the guide ropes, and the bows of the machine sprang up into the air, jerking the other rope from the hands of its holders. The stern flew up 200 feet with a terrific jerk, and then the flying machine plunged headlong into a field and smashed the keel into matchwood. The spectators rushed to the rescue and found M. Santos Dumont picking his way out of the *debris*. Needless to say that the repairs necessitated were put in hand at once by this indomitable young man, who expects to be ready again in a few days.

I WOULD like to say a word with reference to Mr. Sidney H. Hollands' letter on the subject of aerial navigation which appears in the last issue of the *Journal*. I say it with due deference, as I do not pose as an authority on the subject, though it has always interested me. If the conditions of gravity as against levity are a matter not of principle but of degree, that is to say, if levity must be construed to include slightly heavier than the air, where is the division between gravity and levity to be made? Obviously the heavier the machine in comparison to the air the greater will be the horse-power required to lift it, and once the principle of slightly lighter than the air has been established, as it undoubtedly has been by M. Santos Dumont, there is, theoretically, no limit to the weight which can be lifted. It is said by those who advocate the levity theory that if a penny balloon be attached to a pigeon it will prevent it from being able to fly. I do not know whether this is the case or not, and I am beginning to discredit all that I have hitherto considered gospel on this subject; but if the difference between gravity and levity in a pigeon is so slight that the action of a penny balloon will overbalance it, then I say emphatically that M. Santos Dumont has exploded another popular delusion. I quite admit, as Mr. Hollands says, that the greatest living and deceased authorities agree on the subject of the flight of birds, but then I submit that those who have acted on their theories have failed absolutely, whilst M. Santos Dumont, who holds a different theory, has succeeded, and instead of trying to convert M. Santos Dumont and to induce him to leave a field which he has made fertile for one which is quite barren, is it not manifestly better to encourage him to complete his trials in his own way?

THE Doherty Motor and Accessories Company, Day's Lane, Coventry, the other day showed our Midland representative a few of their leading specialties, including a handsome-looking engine-cover or bonnet, fitted with brass door, louvres, and polished brass bevels, a brass-mounted petrol tank for dash-board, and an effective silencer for motor-bicycles, fitted with two internal partitions with specially arranged holes.

THE authorities of the Congo Free State have decided to abandon the Stanley Falls to Redjaf Railway, because it has taken eighteen months to construct 109 kilomètres out of the thousand to be covered. The railway will be replaced by a service of heavy automobiles for passengers and goods from Ibembo or Djabbir to Faradje and Redjaf, thence to the Nile. The service is expected to commence in three months.

HERE AND THERE.

It is reported that the German Emperor has ordered a new motor-car from a firm in Aix-la-Chapelle.

DUBLIN is organising a big Lifeboat Saturday demonstration, in which owners of motor-cars and motor-cyclists are invited to assist.

A SPECIAL petrol motor delivery-van has just been completed by the Peugeot Company, for the use of the postal authorities in Paris.

THE decision of the Italian War Office to adopt motor-cars for military purposes is said to be the direct outcome of the recent tour of the Italian Automobile Club.

DR. C. C. WEEKS, of Lewisham Park, S.E., is one of the latest members of the medical profession to adopt the motor-car. His choice has fallen on a Weston steam car.

It is announced that the Berliner Maschinenbau Actiengesellschaft, of Berlin, have arranged to build all types of Thornycroft steam vehicles in Germany.

AT Dorking Petty Sessions, on Saturday last, Sir F. H. Bathurst was fined £1 for allowing his motor-car to emit steam when passing through the streets of the town.

LADY JEUNE has been again extolling the delights of automobilism in the Press, and delighting her readers with an account of a motor-car tour in the west of England.

MOREELS, the driver of King Leopold's motor-car, has been arrested, and is to be prosecuted for driving the Royal automobile at a furious pace and to the danger of life.

MESSRS. BROWN BROTHERS, Limited, inform us that they are opening a motor-car depot at 22, Great Eastern Street, E.C., where they will keep a stock of cars, accessories, and parts.

A CONSPICUOUS feature of the Italian Army manoeuvres now in progress is an armoured automobile, designed by Colonel R. Sismondi. It has three seats, weighs 25 cwt., and carries a mountain gun.

ONE of the latest biograph pictures at a London music-hall is a scene illustrating the recent Paris-Berlin race. It depicts a level stretch of road, along which the cars can be seen flying along at a terrific pace.

MOTORISTS touring near Inverary are warned to go slowly when near the bridge at Cladich, the approach to which from the Inverary side is a very steep gradient terminating in a sharp turn immediately at the bridge.

THE Mayor of Turin, Signor Tampa, who recently started from Fenestrelle in a 5 h.p. motor-car, ascended the Great Saint Bernard as far as forts Vecclua and Centiphagne, attaining an altitude of 2,849 mètres, thus beating Mr. Maurice Farman's record climb on the same track by 194 mètres.

Mr. W. H. J. WIMSHURST, who has been connected with the motor industry almost from its infancy, has joined the firm of the Brooks Motor Company, Limited, Holbrooks Lane, Coventry. Very shortly this company will have an up-to-date voiturette on the market which we hope to report upon.

"A STRICT observance of the rules of the road, even in little frequented bye-ways, by all who use them, whether drivers of horses, cyclists, or automobilists, would," says the *East Anglian Daily Times*, "conduce to the convenience and safety of everyone, and prevent mutual recriminations between the conflicting interests of the new and the old."

THE Brooks Motor Company, Limited, has been registered with a capital of £2,000, to adopt an agreement with H. Brooks for the sale of certain machinery, plant, stock, and effects at the Motor Works, Holbrooks Lane, Coventry, and to carry on the business of engineers, motor-cycle, and motor-carriage manufacturers, etc. The registered office is at the motor works, Holbrook's Lane, Coventry.

THE Millennium Motor-Car Syndicate and Agency, Limited, has been registered with a capital of £1,500, to adopt an agreement

with F. Bryan and A. H. Bayley, for the acquisition of certain inventions in relation to electric ignition for explosion engines, and to carry on the business of manufacturers of, and dealers in, engines, motor-cars, cycles. The registered office is at 87, Wellesley Road, Gunnersbury, Middlesex.

A NOVEL race from Paris to London took place last week between a Panhard and a Renault, for the purpose of deciding a sporting wager of £300 a side. The contest, says the *Express*, had a strangely unforeseen conclusion. It was almost a neck and neck race all the way to Dieppe, but on arrival there M. Lamberjack learnt, to his amazement, that to take the Panhard back to France there would be Custom House duties amounting to no less than £600. As this sum doubled the amount of the wager, he decided to abandon the race, and to cross without his car. The Renault car, which was driven by Mr. Comist, left Newhaven about seven o'clock in the morning, and was in London just after ten, thus winning the wager.

A NEW collapsible bucket for use on motor-cars has been put on the market by the B. F. Goodrich Co., of Snow Hill, E.C. The bucket is fitted with a screen, so that no foreign matter

can pass with the water into the tank; it folds up very compactly, thus taking up very little room when not in use. The makers caution users against putting petrol in the buckets which are only intended for use with water. The Goodrich Company are also making a combination funnel which stows away, as will be seen, in a very small place. It will be noticed that the funnel is fitted with a handle and a bottom valve.

When the valve is closed the funnel may be used as a bucket, and the filling of a water tank through a small opening is made a very simple matter by merely opening the valve. The appliance is well made, the tap being of vulcanite.

MESSRS. TOWNEND BROS., Limited, of Coventry, are one of the latest cycle firms to turn their attention to the motor-bicycle, and will probably be placing one of the Minerva type on the market shortly.

A NEW $1\frac{1}{2}$ h.p. petrol motor for use on motor-bicycles has just been put on the market by Messrs. Butler Bros., of Dale Works, Derby. The firm are not making motor-bicycles, but are furnishing the engine and all the necessary accessories ready to be fixed to a bicycle.

AN automobile gun-carriage battery, consisting of two guns mounted on automobiles, began a journey from Chicago to Washington on Wednesday last week. Major Davidson, of the North-Western Military Academy, is in charge of it. He expects the journey to prove automobile gun-carriages of practical use in warfare.

THE Albany Manufacturing Company, of Cumberland Park, Willesden, undertake repairs and improvements to steam cars. The company's system of air condensers, feed heaters, water coolers, steering gears, heavy oil burners, oil separators, sight feed lubricators, and many other improvements, are calculated to facilitate the running of cars at a considerable decrease of cost.

A CASE of considerable importance to automobilists was decided at Slough last week, when Mr. Thomas Fuller Toovey was summoned for not displaying a red light from behind his motor-car. He said he had both front and side lights, and although he had driven a motor-car for two-and-a-half years, he was not aware that he had to carry a red light. The Bench fined him £1 7s. 6d., including costs.

AT a meeting of the Sunbury District Council Mr. Hyde inquired if the Council could make rules and regulations to prevent motor-cars from travelling through the village at the excessive rate of speed which they did at present. The Clerk replied that urban councils had no power, but they could make application to the Middlesex County Council, who could deal with the matter. It was unanimously resolved to do this.

MR. F. C. BLAKE has removed his motor-car business from Ravenscourt Works, Dalling Road, Hammersmith, to larger and more convenient premises at Station Avenue, Kew Gardens, adjoining Kew Gardens Station. The new works are fitted up for the manufacture of the Blake specialities—coils, accumulators, plugs, contact breakers, radiators, carburettors, etc. A separate department will be kept to deal promptly with repairs to any type of car.

THE latest "cycling sensation" on a pocket track is at the Oxford music hall, when the popular experts, Lotto, Otto, and Callaghan, give a so called "miraculous" display of riding on a track of about the same dimensions as that at the Pavilion. The pursuit racing is extremely exciting, and the passing on such a small path is, as described, miraculous. This week Lotto has increased the interest in the performance by riding a Werner motor-bicycle.

THE Pocklington Rural Council have unanimously adopted the following resolution and decided to forward a copy of it to the East Riding County Council:—"That in the opinion of this Council it is advisable that regulations should be made for compelling drivers of light locomotives to produce some test of efficiency, and also for compelling the registration of each light locomotive and the carrying thereon of a distinguishing mark or number whereby the same may be identified."

WE hear excellent accounts of the results obtained by the sparking plugs supplied by the Electrical Ignition Company of Highgate Square, Birmingham. One motorist, who formerly used porcelain-fitted plugs, with which he had endless trouble due to the porcelain cracking and getting loose, reports that the E.I.C. plug has given him great satisfaction, having lasted much longer than the previous nine fitted with porcelain, and is still as good as ever.

IT is now established beyond the reach of controversy that intending purchasers of motor conveyances need not resort to France or to any other foreign country. In every essential respect the home made machine is equal to the best produced

abroad. Whether in regard to endurance, speed, hill-climbing, or safety, the British competitors in the Glasgow trials fully held their own against all comers, and the average price is also said to have been somewhat less.—*Globe*.

SOME time ago some of our readers stated that they found considerable difficulty in getting broken sparking plugs repaired efficiently in England. We now learn that the electrical department of the Speedwell Motor Car Company, of Broad Street, Reading, has taken this matter in hand and consequently are now in a position to execute repairs and renewals to all types of sparking plugs. They have sent us a sample of a repaired plug which it is difficult to distinguish from a new one, the repair compares favourably with similar work turned out by any French house.

A MOTOR fire-engine has this week been delivered to the Corporation of Eccles. The engine, which is intended for first aid purposes, carries five men, four ladders, 300 yards of hose, two stand-pipes, and other appliances. The contract requires it to carry this load at a speed of fourteen miles an hour, and to ascend any gradient in the borough. It is worked by electricity and oil combined. The preliminary tests have been severe, and the engine, carrying seven firemen, successfully turned out on Tuesday to false alarms.

A SIX days' test of reliability of motor-vehicles, organised by the Automobile Club of America, commenced on Monday last, when seventy-seven *chauffeurs* started on their cross-country trip from New York to Buffalo, a distance of 500 miles. The distance is to be covered in six days, Hudson being the first day's destination. The first car to reach Hudson was a 30 h.p. French machine, actuated by petrol, belonging to Mr. David Wolfe Bishop. Second to arrive was Mr. B. B. McGregor (petrol) and Mr. Albert C. Bostwick, (petrol) was third.

PORT-GLASGOW was last week the scene of a most unfortunate motor-car fatality, of which Mr. William Smith, sheriff's officer, was the victim. A motor-car, which is the property of Mr. Kidston, of Finlaystone, was approaching the town from the east, and, getting beyond the control of the driver in Robert Street, dashed violently into the corner at Blackston, at the same time knocking down Mr. Smith, who, though he did not appear to be much injured at the time, died a few hours later. The unfortunate gentleman, who was well known in Port-Glasgow, was seventy-one years of age. The occupants of the vehicle escaped without injury, but the car was badly damaged.

THE United Alkali Company, Limited, of Hazlehurst Works, Runcorn, recently hired a 2-3 ton steam lorry, from Messrs. T. Coulthard and Co., Ltd., to take a two ton load of "Red Maid" soap from Preston to Glasgow. It took four days only to reach Glasgow, including the ascent of Shap and other steep hills. This is a good performance, especially as water had to be taken every twelve miles. During the week of the Trials, the wagon ran about Glasgow and neighbourhood distributing samples and circulars. It now remains in Glasgow making deliveries of soap for Messrs. J. Gilchrist and Company, 37, Carrick Street.

MESSRS. DE DION-BOUTON AND CO. have now adapted their well-known petrol motor for launch purposes, and are prepared to supply engines of 3 and 4 h.p. complete with gear resting on an aluminium bed suitable for bolting to a launch. As a means of testing these engines De Dion-Bouton, Limited, have just had a boat constructed by a firm of well-known French builders, and also one by Messrs. A. Burgoine and Co., of Kingston-on-Thames. The former boat is now on exhibition in their Regent Street showroom, and the latter is lying at Messrs. Burgoine's boat-house ready for trial by any prospective purchaser. A great advantage of the De Dion motor is the power developed in proportion to the space occupied. Having electric ignition it can be started at once, and there is no danger from fire. The boat is very easily managed by one person, as the steering is effected by a slide at the side of the boat actuated by two handles, one of these being placed on the right hand of the engineer's seat, and the other towards the stern, so that it can be driven and steered by one person.

THE "B" ELECTRICAL CONTACT BREAKER AND IGNITION PLUG.

THE accompanying illustrations (Figs. 1 to 4) show the simple construction and mechanical arrangement of a new contact breaker, which, under the name "B," is being introduced by the Autocar Supplies, Limited, of Great Russell Street, London, W.C. The apparatus is applicable to motors with any number of cylinders, as the working parts are merely duplicated, or added as required. It will be seen that two pairs of metal uprights are fixed on an ebonite base, which

FIGS. 1 to 4.

supports two steel springs. Both springs are held firmly at one end by means of a screw, the other end running free in a groove on the top of the upright. In this way the springs cannot vibrate, but are free to move longitudinally as required. The straight spring has on its lower face a shaped guide piece held in position by a rivet, the head of which on the upper face of the spring is tipped with platinum. The bent spring has a corresponding platinum tipped contact point on its lower face. The cam shown below moves these springs once per revolution, causing a good contact to be made and broken again once per revolution,

FIG. 5.

at whatever speed desired. The surfaces are always clean as the springs form a rubbing contact when raised or lowered by the cam. The whole is mounted on an ebonite base, and the cover is fixed by a thumb screw. It is claimed for the "B" electrical contact breaker that it has a rubbing surface which ensures cleanliness and good contact, and that no trembler is required in connection with it. The apparatus requires oiling slightly, and therefore is not subject to the disadvantages of similar devices in which great care has to be exercised in keeping them free from oil.

The Autocar Supplies Company are also introducing a new ignition plug. This is illustrated in Fig. 5, and is of the De

Dion type, made and mounted with very great care to ensure good conductivity. The composition used is of a special kind, and is practically indestructible. It is claimed that the composition will not break away except after very long use, and that the connections cannot become detached.

SOME OBSERVATIONS ON THE IRISH AUTOMOBILE TOUR.

BY CHARLES JARROTT.

It is to be regretted that a much larger number did not fulfil the promise made earlier in the season to the Irish Club to take part in the tour. The splendid arrangements made for the comfort and convenience of the tourists were somewhat wasted in view of the fact that provision was made all along the route for at least three or four times the number of those who actually turned up. The hotel people were particularly disappointed and I think to an extent the inhabitants of the larger towns we passed through also expected a much larger number of cars. The reception, however, was none the less hearty on this account and in every place en route the utmost enthusiasm prevailed.

Of the cars in the Tour four were taken over from England for that purpose, and were as follows:—Mr. Harvey du Cros, junior, on a 7 h.p. Panhard; Mr. Roger Fuller, on a 4½ h.p. De Dion; Mr. Buckee, on a M.M.C. car, and myself on another 7 h.p. light Panhard and Levassor car. Our reception, as I have before said, could not have been better and our thanks are due to Mr. R. J. Meeredy and Mr. Eaton, the indefatigable organisers of the Tour, for the provision they made for our comfort and for the success of the trip. I would also like to thank, through the *Journal*, Messrs. Hutton and Sons, of Dublin, who placed their extensive works at our disposal, storing our cars, supplying us with petrol, etc., and also Dr. Colohan for the assistance which he personally rendered. I cannot imagine a tour of a more interesting character throughout. At every village and town the whole of the inhabitants turned out and gave the tourists a splendid welcome. The police kept the road clear and the tour almost developed into a triumphal procession from town to town. In Carlow, for instance, on the first day, the Chief of the Police met the cars outside the town, and escorted them in personally, he occupying a seat on the leading car. Peculiar also was the reception afforded the cars by the peasants in the South and West of Ireland. Never having seen an automobile before, and in innumerable instances never having seen or heard of a railway train, the motor-cars presented to them a spectacle of a character they had never even conceived. Amusement, surprise, consternation, and fright were expressed in the various ways in which the cars were received.

It might possibly here be well to say something in regard to the roads as from a motorist and tourist point of view this is an all-important point. I must say that I had been very unfavourably impressed from the various accounts I had received from Ireland in regard to the character of Irish roads, but, after covering 1,200 miles on the roads in question, my opinion has been entirely changed, and while in places they are distinctly bad, there are, nevertheless, many splendid roads on which a motor-vehicle can travel top speed. At the same time the Tour mapped out was over roads of various descriptions, and I do not think I would advise the owner of a large motor-car to take his vehicle over for touring purposes, as I think the smaller type of vehicle is much more suitable, being handier in tight places and altogether more wily. For instance, I would personally never wish to take a more powerful car than the 7 h.p. Panhard I was driving. This seems to be an ideal car for the roads on which bad stretches were met with, and especially when one desired to do a little mountaineering by way of an experience. For instance, the ascent made by Mr. du Cros, Mr. Fuller, and myself of the Gap of Dunloe would have been quite impossible on cars any larger than those we were on, and had we attempted it with larger cars, only failure could have resulted. On some of the cross-country roads which we explored very bad humps were frequently encountered, and it was not difficult to imagine a large car negotiating one of these with the fly-wheel of the engine resting on the hump itself. These peculiar humps were not long or large but they were exceedingly sharp. Again, in climbing some of the mountain passes and also in descending, I appreciated the importance of having a light car with a powerful brake, as not only could one travel much faster, but also much more safely. I mention these few points in regard to the use of a small car as being important, as I think Ireland should particularly appeal to those motorists who do not drive fast, but who nevertheless enjoy motoring, and who would at the same time enjoy "sporting driving."

Ireland's fame is world-renowned from a scenic point of view, the beauty and grandeur of the Lakes of Killarney, the magnificence of the Kerry Mountains, and the constant change of effect and colour alone making the trip well worth the distance covered. In taking the route of the tour which has just been concluded, it will be seen that we had the opportunity of going through the finest districts in Ireland from this point of view. It might, therefore, possibly be worth while to deal with our runs day by day serially.

The first day was from Dublin to Waterford, and although this run did not present to us fine scenery, nevertheless it gave us very good roads, and a splendid pace was maintained, the English contingent being the first to arrive in Waterford. On the following day the run from Waterford to Cork gave us an opportunity of

inspecting the Duke of Devonshire's lovely Castle at Lismore. Here again the roads were splendid and we were able to travel very fast, being waved on with an encouraging hand by every policeman met with en route. The following day's run from Cork to Killarney gave the English motorist a taste of driving of a description we had not experienced before. One is not likely to soon forget the magnificent view obtained after climbing up and up to Windy Gap in the Kerry Mountains, and the experience of the run down afterwards through a winding path with acutely sharp corners requiring the greatest care in negotiation. Our first view of the Lakes of Killarney and the scramble into Killarney afterwards along a long twisting road was another never-to-be-forgotten experience.

On the following Monday, the day arranged for the run to Waterville from Killarney, Mr. Fuller, Mr. du Cros, and myself were discussing the possibilities of negotiating the famous Gap of Dunloe, about which we had heard so much, and regarding which we had been told, with a nod of the head intended to carry conviction, by every person acquainted with the Gap, that it was ridiculous to attempt to climb up on a motor-car, as only on one occasion had a wheeled vehicle of any description got through. Nothing daunted, however, we decided to make the attempt and, Mr. Fuller starting away half an hour before us, we eventually arrived at the bottom of the Gap to see him some distance up looking a mere speck waving to us by way of encouragement. We at this stage met with our first difficulty, as we found that the roadway was under water for some considerable distance and to proceed would necessitate driving our cars through the water, the depth of which we were totally unacquainted with. However, after making one or two soundings with a board close to the edge I decided to make the attempt, and covering up my sparking plugs to prevent their being drenched by the water thrown up by the fly-wheel, I plunged through, followed by Mr. du Cros, and came out the other side successfully. It is, perhaps, unnecessary for me to write much regarding the actual ascent of the Gap, as so much has already been written about it. At the same time, it must be recorded to the credit of the cars which successfully negotiated it, for I know of no harder piece of work than the climb accomplished that day, and, in fact, had I been over the ground beforehand I would have unhesitatingly declared that it was impossible for a motor-vehicle of any description whatever to have got through. With a steep cliff on one side and a fall of a greater distance than one cared to think about on the other, the possibilities in the event of the car stopping and running backwards were too varied to be contemplated. We caught Mr. Fuller up about two-thirds of the way, and the three cars eventually arrived at the top together, a triumph of the mechanical vehicle which at least the three of us who drove fully appreciated. It is interesting to record, also, that two ladies—Mrs. Edge and Mrs. Fuller—were on the cars during the ascent, and I had as my passenger at the time Mr. E. J. O'Reilly, of Irish renown, whose enjoyment of our success was keen beyond measure.

A glorious run from there through the Black Valley, with a little more mountaineering thrown in, over a road which apparently hardly ever saw a vehicle of any description, coming upon water falls practically unknown and beauty spots never heard of, was to us the most enjoyable run of the tour. We joined our comrades at Parknasilla for lunch, and told the story of our success to the almost incredulous ears of the rest of the party. Henceforth the two Panhards and the De Dion which accomplished the ascent were respected in a manner before unknown. From Waterville on to Killarney, from Killarney to Limerick, and from Limerick on to Kilkenny we proceeded, and on the latter run I had a funny instance of the awe-inspiring effect of a motor-car upon the ignorant mind. Having lost my way, and finding myself about fifty miles from the place where I should be for luncheon, I pulled up under the shelter of a house—for a rain shower was on at the time—and asked the way from three girls who were standing there for shelter. I know not whether it was the black mackintosh or the dust glasses which I had on, but in any event the motor had such an awe-inspiring effect combined with my presence in such an outlandish garb that without waiting any further they promptly took to their heels and bolted.

At Kilkee, I had to leave the Tour, as also had Mr. du Cros and Mr. Fuller, to return to Dublin owing to business. Our run from Kilkee to Tipperary on to Kilkenny, inspecting en route the famous Rock of Cashel with its beautiful ruins, was one of the best we made. From Kilkenny right on through the Wicklow mountains, staying a couple of nights at that beauty spot Glendalough, negotiating on the way the famous hill at Luggala—much to the wonder of the country onlookers—and we were once more in Dublin. Personally, I was gratified beyond measure with—shall I say—everything? Arrangements were perfect, scenery was perfect, everything was perfect, and I left Ireland with the recollections of a tour without question the most enjoyable in which I have ever participated.

Crossing over to Holyhead the three cars then proceeded to Birmingham with a nice little run of about 150 to 160 miles for the day, and the next day from Birmingham to London, and so home. It was exceedingly gratifying throughout the tour to be able to be at every place at the appointed time. The only trouble experienced by any of us en route occurred to me through endeavouring to pass a Kerry cart to which a mule was attached, and which very considerably occupied the whole road, thus forcing me into a stone wall. Even this, however, did not seem to disturb the going capabilities of my car, as after the attentions of the village blacksmith everything was in shape again and I was able to proceed on my way in about half an hour.

THE COOLING OF THE CYLINDERS OF HIGH-SPEED INTERNAL COMBUSTION ENGINES.*

In comparatively large, slow-running, stationary oil or gas engines it is easy enough to have a water-jacket with one or two fairly large tanks of cooling water; but, upon a motor-car, where weight is a prime consideration, the matter of cooling is one which causes great trouble, and the provision for which has involved arrangements of great ingenuity. In quite small motor-vehicles, such as motor-bicycles and tricycles, and even the small voiturettes—that is, with engines up to 3 h.p.—the movement of the vehicle through the air, or the provision of a revolving fan, is taken advantage of for the purpose of cooling the cylinders, the latter being provided with a small number of webs for this purpose. With small engines air-cooling is fairly effective in quite cold weather, but in hot and dry weather—which is, of course, chiefly the time when motor-vehicles are in requisition—even small motors of little more than 1 h.p. rapidly become heated with a corresponding falling off in propelling power, ultimately stopping altogether. No doubt, by careful management in the way of continual regulation in the admission of gas into the carburettor, and great watchfulness in taking advantage of every descent of a hill to cool the cylinder, and, further, by being content with a moderate speed of the engine, an air-cooled cylinder of 2½ to 3 h.p. can be kept cool even upon a fairly hot day. I have, however, recently had some experience with two tricycles, one having a 2½ h.p. engine, air-cooled, and another of the same power, with a water-cooled head, the latter being the most recent type of De Dion motor, in which a small tank of water is carried behind the saddle, and a small radiator, through which the water

FIG. 1.—ELEVATION AND PLAN. FIG. 2.—ELEVATION AND PLAN.

circulates by gravitation, are employed. I have no hesitation in saying that the power developed in the latter case has been very much greater than in the former, while there is no comparison whatever in the distance which can be covered on a hot day by the two machines.

I have had a similar experience with regard to my two cylinder New Orleans voiturette. This car, in spite of many defects, such as are probably to be found in most motor-cars, is a fast little vehicle, and the air-cooled cylinders, which have a fan revolving between them, can in quite cold weather, or even with an abnormal amount of care in hot weather, be made to run very well. In hot weather, however, I have experienced so much annoyance with the heating of the cylinders upon a long run, that I first of all adopted the plan of allowing water to drop upon the air-cooled cylinder head from a reservoir when I found the cylinder was getting hot, but afterwards decided to replace the air-cooled heads with water-cooled heads. Since doing this I have never had any trouble whatever with the heating of the cylinders, or experienced any diminution in power from this cause. On one of the hottest days of the year the car went about a hundred miles, and returned a few days later without my experiencing any trouble, at any rate, from this cause. The details of the arrangement adopted are illustrated diagrammatically in Fig. 1. The hollow water-cooled heads AA, together with the valve chambers BB, which are in one solid piece, replace the ordinary ribbed head and valve chamber. The hot water rises directly from the centre of the top of the cylinder head by the pipe C, discharging at the top of the copper cylinder DD, while the circulation is maintained by the descending water passing out at the bottom of the copper reservoir by the pipes EE through a copper coil which is shown in plan at F. The circulation through one cylinder is entirely separate from that through the other, and complete in itself, both having, of course, a common reservoir in the copper cylinder DD, the level of water in which is shown by means of a water-gauge H.

* Abstract of paper read before the Mechanical Engineers Section of Glasgow Engineers Congress, by Professor Hele-Shaw.

It is interesting to notice that when the engine starts a warm layer can be felt by putting the hand on the top of the copper cylinder while all the rest of the system remains quite cold, and how, as the engine continues to work, the zone of heat travels downwards, showing that the hot water rises immediately, and remains on the top, and indicating the perfect nature of the circulation. In view of all the trouble I have seen and experienced myself with cars in which pumps are used, as they generally are, it seems a pity that circulation by means of gravity cannot always be employed. Both with the tricycle mentioned and with the voiturette the water on a hot day during a long run is for considerable periods at a time on the boil, without the power in any way appearing to appreciably diminish; whereas, on the other hand, I have been on larger cars where, owing to the defective working of the pump, the water was not circulating properly, and a considerable amount of steam formed. In the latter cases the power fell off in a very serious manner, although the engine never actually stopped, as I have seen it do with air-cooled motors. It is clear, on a little consideration, that the rate at which water is boiling off, and not the actual fact that water is in contact with the cylinder walls, must be largely a measure of internal heat of the cylinder. On the other hand, amongst those who are accustomed to drive motor-cars, there is generally a feeling that the engines work best at a certain temperature somewhere between that at which the water boils off and the cold state in which the engine actually starts. I have not been able to find that there exist any actual data upon this subject, and it seems to be a sufficiently important matter to be worth making some experiments upon. I, therefore, with the assistance of Mr. Gill, B.Sc., engineering student of the University College of Liverpool, experimented upon the 6 h.p. engine represented in Fig. 2. This engine, which has magneto electric ignition, was fitted with two thermometers, A measuring the water at the entrance, and B that at exit. C is a tank which was used when the water was allowed to remain at boiling point, but otherwise the two pipes were connected with the mains, and the water at exit kept at the temperature required by allowing a sufficiently rapid flow of water through the cylinder jacket. D is the flywheel upon which a dynamometer brake acts, so that the power can be accurately tested. A series of five trials were made, four with the water at different temperatures, and the fifth with glycerine circulating in the cylinder jacket and tank instead of water in order to obtain a higher boiling point and a higher temperature of the cooling liquid.

FIG. 3.—DIAGRAM SHOWING RELATION BETWEEN BRAKE HORSE POWER AND TEMPERATURE.

The general result of these trials is given in the following table and diagrams. (Fig. 3), in which the ordinates represent brake horse-power (which it will be seen under the best circumstances never exceeded about 4½), whereas the abscissæ represent the temperature of the water at exit. I have kept the two series of boiling off experiments separate from the other three, but the plotted results indicate the same general result:

SUMMARY OF TESTS.

Trial No.	Temp. of entry.	Temp. of exit.	B.H.P.	Revs.
1.	66.2 deg. F.	77.0 deg. F.	4.775	1086.3
2.	64.4 "	131.0 "	4.47	1084.0
3.	64.4 "	212.0 "	3.97	903.0
4.	212.0 "	212.0 "	4.07	925.6
5.	253.4 "	253.4 "	3.937	906.0

In experiments 1, 2, and 3 the water was running through. In experiment 3 only a small quantity was allowed to flow, it being completely evaporated. In experiment 5 glycerine was used.

The general nature of these experiments is immediately obvious, and indicates a falling off in brake horse-power as the temperature rises, the brake horse-power between the two extremes of temperature having fallen from 4.775 to 3.93, a diminution of about 17 per cent.

Each series of experiments represents, roughly speaking, about ten

observations, and were conducted as carefully as possible; but, at the same time, the difficulties of maintaining uniformly the temperature and speed of the engine were sufficiently great to make it undesirable to attempt to produce any mathematical statement from these results, and further and more elaborate experiments will be required of temperature taken in conjunction with the actual quantity of water used before any definite conclusion can be arrived at on this subject.

I have not attempted to discuss the actual cause or causes of the falling off in power as the temperature of the cylinder rises. Whether this is due to lubrication difficulties or thinning of the cylinder lubricant to a point which allows the piston rings to leak, or whether due to heating of incoming charge and consequent weakening of the mixture would afford matter for an interesting discussion. The advances in the construction of these high-speed internal combustion engines, and the rapidly-increasing power which is being evolved from them, warrants their careful study. Thus, in the recent Paris-Berlin race there were several engines upon light motor-vehicles capable of developing more than 50 h.p. with, in one case at least, a weight of not more than 10 lbs. per horse power. When it is remembered that this is not merely the equivalent of the steam engine, but of the engine and boiler, it will no doubt be admitted that any of the points, such as the cooling of the cylinders, which is an essential feature of the problem, is worthy of the attention of this congress.

FURIOUS DRIVING CASES.

At Colchester Police Court, James Paull was summoned for driving a four-wheeled motor-cycle at a greater speed than was reasonable, having regard to the traffic. Inspector Ward, in company with Police-Sergeant Alexander, saw the defendant driving the motor-cycle up St. Botolph's, towards Queen Street, at a rate of ten to eleven miles an hour. There was a lot of traffic about, and while going at that speed the defendant passed within three feet of a young man in charge of a market stall. There was no doubt that had the motor not been very skilfully handled he would have run into somebody. In the inspector's opinion the speed was excessive. The defendant denied going more than eight miles an hour. The defendant's father gave similar evidence. The chairman said the Bench had very carefully considered the case, and had decided to dismiss it without any comment.

At King's Heath, Charles Thompson was summoned for driving a motor-cycle at a rate greater than was reasonable on August 21st. Defendant offered to present his motor-tricycle to the King's Heath Bench or to the police if they found it was capable of travelling at a rate of thirty miles an hour, as was suggested by Police-constable Waters. The challenge was not accepted, and the Bench fined defendant 20s. and costs.

At Pocklington Police Court, H. Spender Clay was fined £5 and costs for driving a motor-car at twenty-four miles an hour on the high road between York and London.

At Yarmouth Police Court, Bertie Miller, motor-car driver, was summoned for furious driving on the Marine Parade. P.C. Legood said he saw defendant driving his car, laden with passengers, along the drive, on August 29th, and saw him collide with a lad on a bicycle, in consequence of his (defendant) driving on the wrong side of the road. Witness shouted to defendant, and he merely turned his head, and continued his journey. He considered defendant was driving at the rate of eight or nine miles an hour. Mr. Clowes, who appeared for defendant, submitted that the case was brought in consequence of the boy running into defendant's machine. Defendant was compelled to go round the lamp-post, on his wrong side, as the road was completely blocked, and he was unable to go the other way. Defendant was only driving at the rate of four or five miles an hour. The case was dismissed, upon the payment of costs by the defendant.

At the Pocklington Police-court, Lord Ingestre was fined £5 and costs for driving a motor-car at the rate of thirty-five miles an hour between York and Pocklington.

At the Huntingdon Police-court, Claude White, of Blairmore House, Bedford, was fined £5 and costs for furiously driving a motor-car on the Great North Road on August 20th. A constable said that defendant's car was travelling at the rate of twenty-eight miles an hour, and that, after being stopped, he drove off at the same pace.

At Eastbourne Police-court, Dick Farman, of Long Acre, London, was summoned for furiously driving a motor-car on the sea front. A constable said the motor-car in question went by "like a flash," and he should think it was going at the rate of thirty or forty miles an hour. Someone on the car had a camera and was taking cinematograph pictures. The defendant denied that he was travelling at a greater speed than ten or twelve miles an hour. Had he been he could not have successfully taken the pictures. The Bench imposed a fine of £5 and costs.

At St. Neot's Petty Sessions, C. C. Lovitt, of Holloway Road, London, was charged with driving a motor-car on the public highway at Buckden, on the 18th August, at a greater speed than twelve miles an hour. P.C. Purser and Arthur Plum gave evidence that the car was travelling at a speed of quite thirty miles an hour. Defendant did not appear but wrote to the magistrates' clerk. Fined £7 and 12s. costs.

At the Farnham Petty Sessions on Thursday, the 5th inst., an application was made for the adjournment of two summonses against Count Seilern, for driving his motor-car at excessive speed on August 3rd and 4th. Mr. Samuel Fleming, instructed by Messrs. Firth and Company, London, said two witnesses for the defendant were unable to be present that day. He read telegrams from Paris and Brussels, to the effect that the witnesses, Mr. Goldsmith and Count De Pret, would not reach London until the following day. Under these circumstances, the magistrates well knew that it was customary for an adjournment to be sanctioned, and he asked that the cases be adjourned for a week. The application was granted on the defendant's solicitor undertaking to pay the costs for that day. The chairman said the bench, in adjourning the cases for a fortnight, did not wish to establish a precedent. The adjournment was made for the production of the defendant's witnesses, and for the purpose of eliciting the truth.

At Altrincham, Edgar John Chambers, of Swinton, was summoned for furiously riding a motor-car at Altrincham on August 18th. Defendant pleaded not guilty, and was represented by Mr. R. B. Batty, solicitor, of Manchester. Constable Proctor and a man named George Heywood, of Woodhouses, Ashton-on-Mersey, spoke to seeing defendant riding at a speed of about eighteen miles an hour. Proctor said the road was full of traffic at the time, but defendant took the road, and the traffic had to divide right and left to let him through. Defendant was accompanied by his wife and children. Mr. Batty submitted that as the machine had a broken piston ring it was impossible for defendant to have ridden at any excessive speed. The Bench said they believed defendant had ridden at an excessive speed, and imposed a fine of £2.

At Ashford, Mr. Holden, of Eastwell Park, was fined £5 and costs for driving a motor-car near Ashford at a rate of twenty-five miles an hour; and his engineer, Albert Holmes, was similarly fined for driving at a speed estimated by a constable at forty-five miles an hour.

At Norman Cross (Hants.), Ernest Jennings, motor-car driver, of Fourfield, York, was fined £5 and costs for driving a motor-car at the alleged speed of twenty miles an hour on the Great North Road.

At Doncaster Borough Court, Mestrad Amedee, motor engineer to Captain F. J. Laycock, of Wiseton Hall, was summoned for furiously driving a motor-car through the town. Mr. Tovey, for the defendant, said at the time the summons was served he was under orders for his master to go to Paris, and he had gone, but he was returning. On behalf of Mr. Laycock he applied for a remand for a week, which was granted.

At Carlisle Bernard Brille, a French subject, was charged with furiously driving a motor-car at Kingstown, between Longtown and Carlisle. One witness, who said he kept a pony and trap and also a bicycle, stated that the car travelled through the village at fully thirty miles an hour; and another witness, who was a railway fireman, put down the pace at twenty to twenty-five miles an hour. Mr. Guthrie, the owner of the motor-car in question, and late member of Parliament for South Northamptonshire, said the car could not travel thirty miles an hour; and if anyone could make it do so he would give them the machine. He offered to take the magistrates for a trip in it, and had brought it to the court. The driver said he could not have gone much above ten miles an hour, as it took him an hour to get from Glingerback to Carlisle, which was ten and a-half miles. Mr. Guthrie said he did not value the opinion of the witnesses for the prosecution "one twopenny brass farthing." (Laughter.) It was complained that a chicken had been killed, and Mr. Guthrie said chickens had no right on the roads—they paid no rates. The Bench imposed a penalty of £5 and costs.

THE PLEASURES (?) OF MOTOR-CAR DRIVING.

A MOTORIST, writing to one of the dailies, considers that in the following he has not overdrawn the picture of the pleasures (?) of driving a motor-car in the suburbs of London:—

You go out of your stables at the rate of one mile an hour, on Sundays five yards an hour, as there are a few hundreds of cyclists coming down the Crystal Palace Hill at a speed varying between four and forty miles an hour. The police take no notice of them, the force being detailed for worrying motor-cars. You then proceed along the road to Bromley—fairly empty on Sundays—and on other days have to contend against the butcher's cart (always on the wrong side of the road), driving between twelve and twenty miles an hour; and the carts coming back from Covent Garden, with the drivers either asleep or reading the newspapers. At last you manage to get on the Sevenoaks Road, and you fancy that, as it is about twenty yards wide, you are fairly secure. Not so, however. Two fellows who, by their dress, must come from the aristocratic quarter of Whitechapel, shout out one to the other: "Look 'ere, Bill! Let's race this 'ere motor," and you find one bicycle on your left and another one on your right. If you are young and inexperienced, you try to put on a little extra speed, thinking that you will shake off the intruders. They keep up with you on the flat, say about a mile and a half, up to Farnborough Church, after which they take hold of your motor-car behind and allow themselves to be dragged up the hill, with some cheery remark like this: "I say, Bill! Ain't this fine?" You have no wish to be had up by the police for racing, so you stop the car and pretend to have some repair to do. The two gentlemen from Whitechapel stop, too, and inform you in a kindly spirit: "We'll wait for you, guv'nor." You then proceed to light a cigar and see the fun out, and, generally, after waiting about twenty

minutes, the two fellows get away. At Pole Hill, if you happen to look backwards, you will find between two and seven cyclists hanging on to your car. They do not drop off till they come to the Pole Arms public-house, and, as they have no further need of your services down the hill, they generally get in front of you, turn round and grin, always keeping within a couple of yards ahead, so as to make sure to have an accident if it be possible.

WITHOUT A LIGHT.

At Folkestone Police Court, Herbert Salter was summoned for driving a motor-car without a light in Foord Road. P.C. Smith said about 10.15 p.m. on the 9th ult. he was in Foord Road, near the baths, when he saw the defendant driving a motor-car without a light. He stopped him, and the defendant said that it had just gone out. Fined 10s. and 9s. costs, or seven days.

At Mortlake, Walter Pullen, of Uxbridge Road, Shepherd's Bush, was summoned for driving a motor-car at Barnes, on the 25th August, without having a lamp in the proper place. Station-sergeant Shepherd gave evidence as to the offence, which was committed after ten o'clock at night. The defendant, who said that he had had an accident with the lamp in question, was fined 40s., and 7s. 6d. costs.

AN UNATTENDED MOTOR-CAR.

At the Surrey County Petty Sessions Frank Sheppard was summoned for having left a motor-car, unattended on the highway on 18th August last. P.C. Lucas saw defendant drive a motor-wagonette containing some eight persons along the London Road. It drew up at the Green Man, and all of the occupants alighted, leaving the car unattended for eleven minutes. The magistrates dismissed the defendant with a caution.

NO LICENCE.

At Kingston, Elias Jessurum, of The Holme, Walton, was summoned for keeping two four-wheel carriages without licences. Defendant, who did not appear, was represented by Mr. T. Young, solicitor. Alfred Henderson, an officer of the Inland Revenue, stated that on April 13th he saw the defendant use a motor-car, and on the following day he was driving another car, for neither of which he had a licence. Defendant had since been written to, but no licence had been taken out. On April 14th the defendant was driving a car to hold four or five persons. Cross-examined: Witness had had some correspondence about the cars with the defendant, who stated he was manager of the Monarch Motor Company, and that he did not keep the cars in the legal acceptance of the term. Defendant had admitted to witness that he sometimes took his wife and other friends with him in the car. Mr. Young contended that his client, as manager of the Monarch Motor Company, required no licence to show the cars to would-be purchasers, who, on buying the cars, would take out the licences. On the date in question defendant was out with a car showing it to a probable purchaser. The Chairman remarked that defendant should have been present to have stated that on oath. Eventually the Chairman said that the simplest matter would be for the Bench to convict, and give the defendant an opportunity of appealing. A fine of 40s., including costs, was imposed.

M. JULES DUBOIS, who will be remembered in connection with the 1,000-mile Trial in this country, has, in conjunction with M. P. Onfroy, just started in business at 71, Avenue de la Grand Armée, Paris, as the Société des Automobiles et Moteurs "Herald." Their speciality is a light car, to which they have given the name "Herald."

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, SEPTEMBER 21, 1901.

[No. 133.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THAT charming district which lies about Oxted, Caterham, and Godstone has been the scene of operations in which a combined force of police and magistrates scored a decided victory over a batch of five motorists, capturing £17 2s. The police tactics were of the usual effective order, measured track, concealed officers, and speed, as far as four of the victims were concerned, estimated at an average of twenty miles an hour. The legal proceedings which followed were only marked by one incident of note. One of the motorists charged with excessive speed did not put in an appearance, and in his absence was called upon to contribute £1 more to the pool than his three companions in misfortune, who were present or represented. Absence of body, however desirable in a railway accident, is not be commended when fines are being distributed to motorists. For blowing off steam, or petrol—the police constable was not quite sure which—a fifth victim contributed £2 and costs to the pool.

A Bold Invasion.

VERY different are the conditions of metropolitan traffic from those prevailing in a provincial town, but this has not deterred Mr. F. J. Bell from endeavouring to repeat in London the success he has achieved in Bournemouth with his M.M.C. public service cars. On Wednesday he set the ball a-rolling with two vehicles, each capable of carrying eight passengers, and hopes in due time to increase the stud to ten. The cars will ply between Piccadilly Circus and Putney Post Office, and the fares are fixed as follows:—Putney Post Office to South Kensington Station, 2d.; South Kensington Station to Piccadilly Circus, 2d.; Putney and Piccadilly Circus, 4d. The cars have a canopy top and glass windows. They are painted in red, black and yellow, and carry a board inscribed "Putney, South Kensington, and Piccadilly Circus." The motor is of 10 h.p., with two cylinders, and the usual four speeds and a reverse are fitted. It is expected that the cars will do the journey in about half the time taken by the ordinary 'bus, and as there are no penny fares there will be fewer stoppages, as most of the passengers will travel at least halfway, and many go right through. No conductors' wages have to be paid; the passengers put their fares into a locked receptacle, as is done on some of the halfpenny suburban 'buses. In one respect, perhaps, the new service has a better chance of success even than in the provinces, the very fact of the traffic being so great in London tending to enhance the superiority of a horseless vehicle, which, apart from its inherent speed capacities, can dodge about so easily among the lengthier vehicles. The route is practically level throughout, and should not impose any undue test on the cars.

The Speed of Motor-Cars.

At Cirencester Rural District Council, on Monday, Mr. R. H. Harrison called attention to the great danger to the public and the residents of his parish by reason of motor-cars scorching down the Gloucester and Cheltenham roads at thirty or forty miles an hour; and he moved that the attention of the County Council and the police be specifically called to the matter. The motion was carried unanimously. At the monthly

meeting of the Grantham Rural District Council a letter was received from the Clerk to the Kesteven County Council with reference to the regulation of the speed of motor-cars. Sir Hugh Cholmeley said they did not object to twelve or fourteen miles an hour; what they objected to was forty. It was decided to petition the Local Government Board to amend their regulations so as to include the registration and numbering of motor-cars.

No Amalgamation.

ATTEMPTS are still being made to reduce the authority of the Automobile Club and the other recognised organisations of the motor trades by the amalgamation of the cycle and motor trades in a joint association. These efforts have previously failed, and from the report of the meeting called by the Cycle Manufacturers Trade Protection Association (which appears in another column) the latest endeavour is doomed to a similar fate. Representatives of the motor industry were invited to attend, but very little interest was taken in the gathering, and there was only a scanty attendance. Attention was drawn to the existence of the Automobile Mutual Protection Association and a resolution was adopted declining the suggested amalgamation. Mr. S. F. Edge's naive remark that he did not know of the existence of the Automobile Mutual Protection Association created some amusement; and it was very evident that the motor traders present were anxious to maintain that loyal unanimity amongst themselves which is essential to the self-government of the industry.

Mutual Loyalty.

THE agreement of the motor trades to exhibit only at the Automobile Club's Show is probably one reason for the proposition made by the Cycle Manufacturers Trade Protection Association, which has thus been rejected by those intimately concerned. Those associated in any way with the industry who are giving sympathetic publicity to this attempt to undermine previous decisions are scarcely acting in a spirit conducive to the loyal unanimity of the trade already expressed in public meeting. This spirit should have been recognised and acted upon by our friends at Coventry, whose persistent efforts to secure the actual amalgamation of the trades have, so far, been met with reverses. The truth is that those interested in the motor industry know their own business best and are the proper people to settle their policy. That having been shown in loyal adherence to a decision to acknowledge the Automobile Club's Show as their only exhibition, minor attempts to create dissension will have little sympathy from those concerned with the future prosperous developments of the industry.

The Number of the Beast.

THERE is no doubt that an advance in the direction of more liberal and rational legislation would be welcomed by the automobilist, reluctant as he may be to suggest that such is advisable. But the offer to place him on an equality with other traffic as regards speed regulations might be purchased too dear, and before any motorist—or councillor for the matter of that—makes up his mind on the numbering question, it would be advisable for him to pay a visit to a country where such regulations are in force, and see what it looks like. The effect of a conspicuous enamelled plate, of early Georgian architecture, aggravated tenfold by a numbered tin lamp at the rear, on an

otherwise smart-looking car, must be seen to be appreciated, and amply excuses the mistaking of such by a tourist for a public vehicle, as occurred to our knowledge recently at a Belgian watering place; while the many objections to it besides the merely æsthetic deserve even more serious consideration. The exaction of a certificate of capability, though in some ways repugnant to our ideas of "freedom," would be less objectionable, while if it could be applied impartially to the other users of the road, the latter would be quite remarkably cleared for up-to-date traffic; but, alas! such a suggestion is but a counsel of perfection.

A Racing Track.

MR. JOHN BLACKMORE, of West Buckland, Wellington, Somerset, revives the suggestion already made in these columns for a special racing track for motorists. He gives definiteness to the idea by instancing the road between Wellington and Taunton as suitable for the purpose. The track, he says, might run a little distance above the turnpike road, just as the railway runs a little below it; then anyone walking or riding on the road would possibly have the pleasure of watching races between a train and a motor-car. Or, if it would be better, the track might be close, or nearly so, to the railway below the road.

Photo by

A MOTORING PARTY AT CARLISLE.

[Mr. T. B. Percy.]

Alas! from Sheffield.

SIR HOWARD VINCENT, M.P., knows a good deal about politics and police, but his views on motor-cars are not nearly so accurate and sympathetic as are those of his colleague in the representation of Sheffield, the Rt. Hon. Stuart Wortley, K.C. Mr. Wortley's speech at one of the dinners of the Automobile Club is still gratefully remembered by automobilists; Sir Howard Vincent's letter to the *Times* has been received with something approaching disdain. Entirely ignoring the fact that motor-cars have to pay a licence, Sir Howard proposes a tax of £5 on motor-cars, and in support of his suggestion makes two misstatements, firstly, that a good machine cannot be bought for less than £500, and secondly that "so rapid is his (the automobilist's) progress that he spends little or nothing on the way." A glance at the show-rooms of motor-car agents and dealers will contradict the £500 fiction, and any hotel proprietor

can testify to the value of the motor-car as regards increasing the number of his guests. The motor-car will revive something of the prosperity associated with good-class inns in the old coaching days, and Sir Howard Vincent must allay his irritation with regard to the motor-car. His brother, Sir Edgar, is an automobilist, and we would suggest they should have a fraternal chat over the subject before he next rushes into print.

A Tax on Cutlery.

REVERTING back to Sir Howard Vincent, the Rt. Hon. Sir J. H. A. Macdonald, president of the Scottish Automobile Club, has a pretty thrust at the anti-automobile knight. His taxation proposal, says the Lord Justice Clerk of Scotland, is much the same thing as if someone were to ask the Chancellor of the Exchequer to put a heavy impost upon Sheffield cutlery because there were a few cases of stabbing in the newspapers. The idea is equally logical.

Carriage Builders and Motor-Cars.

IN the course of his presidential address to the British Institute of Carriage Builders at Bristol, on Tuesday, Mr. Alexander Naughty remarked that, judging by the number they saw about, and by the number of orders in the manufacturers' hands, motor-cars were, undoubtedly, going to play an important part in the vehicular traffic of this and other countries. When visiting a carriage builder's factory a few weeks ago, it was an eye-opener to him to see the number of bodies being built to place on electrical motors. He considered that the business should be in the hands of the carriage builder, and that the best results would be attained by the carriage builder and the engineer working together. Carriage builders who had more than one son would show their far-sightedness by inducing one of them to learn engineering. It was only adding one more to the many branches of their calling. In the discussion which followed Mr. G. Hooper said that carriage builders must adapt themselves to the changed circumstances. He had, however, no fear that the carriage trade would be crushed out by motors and cycles. Mr. J. Roberts advocated carriage builders getting motor-cars and learning all about them. Mr. W. Hooper expressed similar views. They should also try and obtain a share of the work of motor-cars, and later on endeavour to secure the whole. Mr. Angus said they should act with caution, because, while probably a good deal of money was to be made out of motor-cars, a great deal of money was to be lost before perfection was reached. Mr. James Young was of opinion that carriage builders should form a syndicate which should choose a particular motor to recommend to their members. Mr. Alexander Henderson said they might make carriages, but the present generation of carriage builders could not make motors.

Yorkshire Automobile Club.

A MOST successful run was held by the members of the Yorkshire Automobile Club on Saturday afternoon last to Boston Spa. The Bradford, Leeds, and Harrogate contingents (which paraded separately) met at the Church, Collingham, and then proceeded to the Royal Hotel, Boston Spa, where tea was served. The return journey was commenced about 7 p.m. The following members and friends were present: Mr. T. E. King (vice-president) and son (Century tandem), Mr. Bishop (Royal Enfield tricycle), Mr. and Mrs. Barnes (De Dion voiturette), Messrs. Ladmere (Daimler), Messrs. Faires and Jones (De Dion voiturette), Mr. Berry (tricycle), Mr. P. McGuire (M.M.C. tricycle), Mr. Hey (hon. treasurer) (Eadie tricycle), Messrs. Geo. Firth and H. Pickles (Royal Enfield quad), Messrs. Palmer and A. W. Dougell (hon. secretary) (Mors car), Mr. and Mrs. Burrows and Mr. Noble (Star car), Mr. and Mrs. Johnson (car), Mr. Winn (tricycle), Mr. B. Walker (De Dion tricycle), Mr. Heaton (tricycle), Mr. and Mrs. Carpenter (quad). The next run will be to the Crescent Hotel, Ilkley, at 3.30 p.m. on September 28th.

The Motor-Car to the Rescue.

THE motor-car has again proved its usefulness. On Tuesday night, the 10th inst., an explosion took place at Llanbradach Collieries, resulting in the death of many men. The engineer of the colliery, who resides in Aberdare, was informed that there was something wrong at the colliery and that he was urgently wanted. By train he could not get to Llanbradach until about 11.45 p.m. Mr. W. Parker Thomas, of the Aberdare Valley Motor Company, Ltd., heard of the accident at 8.20 p.m. and at once offered to drive the engineer by motor-car. The offer was accepted and by 8.35 p.m. a car was at the engineer's house ready for the 16 miles journey over the mountains. The journey was commenced at 8.40 and Llanbradach was reached at 9.45, thus gaining two hours over the train. The engineer and Mr. Thomas remained at the colliery all night and returned to Aberdare in a pouring rain next morning in time for breakfast. We may add that the car employed was a 6 h.p. Daimler, which has been in daily use for the last two years.

A Patriotic Industry.

THE prominence given to the story of the motor-car in France, which has just appeared in the *Pall Mall Magazine*, from the pen of Mr. Robert Crawford, has evidently proved of considerable interest to English journalists—judging from the quotations that have appeared in various newspapers. Mr. Crawford declares that the 1902 motor-carriage will be lighter and cheaper than the present one, and that the efforts of builders in the future will be directed towards improving the gearing and organs of transmission. With regard to the future of automobilism, the author rightly points out that it will mainly depend on the professional classes rather than upon the men who can spend hundreds of pounds upon a racing car. Prices, he says—and the point is one worth discussion in our correspondence columns—tend to shake down to £40 for every horse-power. In France about one million sterling is invested in automobile works, which employ ten thousand men. Probably, according to Mr. Crawford, 60 per cent. of invested capital gives no dividend; 35 per cent. gives a return of 4 or 5 per cent., and the remainder yields dividends ranging from 8 to 800 per cent.

Colonel Crompton on the Motor-Car.

COLONEL R. E. CROMPTON, in his presidential address to the Mechanical Section of the British Association, said that a most important problem in locomotion was that caused by the congestion of street traffic in our towns and by the undoubted difficulties which existed in carrying workers to and from their homes in the country to their places of employment in towns. After many years of objecting to the use of the overhead trolley system, town authorities seemed now to have determined that the only way of relieving street traffic was by an enormous development of electrical tramways. It seemed opportune to point out that a great deal of mischief might accrue from this indiscriminate use of tramways. Vehicles on the plain road surface could overtake a stopping or a slower vehicle going in the same direction without interfering with other vehicles, but street tramways must stop to set down and take up passengers, and this limited the speed average and the number of vehicles. It appeared certain that, although the provision of electrical tramways was undoubtedly an economical means of carrying passengers, these tramways could not be laid in existing thoroughfares without considerably reducing the total road carrying capacity at times of heavy pressure of traffic, and it appeared likely that either for the daily transport of the workers to and from their homes to places of employment, or for taking great crowds out into the country for pleasure purposes, a motor-car service carried out on well-made roads would compete favourably with, and in many ways might be preferable to, tramway service.

Points for Improvements.

CONTINUING, Colonel Crompton remarked that to be universally successful motor-cars must be made so as to reduce to a minimum the liability to break down; repairs must be limited to the replacement of worn or damaged parts by other parts, which must be supplied by the manufacturers so as to be readily put in by unskilled users. The organised manufacture of machines with thoroughly interchangeable parts could only be developed after the type of machine had settled down, and this up to the present could not be said of the motor-car or motor-wagon. At first sight steam, with the complications of boiler, engine, and condenser, did not appear likely to compete favourably with the simpler spirit motor, but for heavier vehicles, where steady, heavy pulling power was of importance, up to the present no internal combustion motor had competed with it. A great deal required to be done in the improvement of the pneumatic tires, which at present became excessively hot, and therefore damaged, by high-speed runs. At high speeds the mechanical work done on the material of which the outer covers of pneumatic tires were composed was excessively high. It could probably be reduced by increasing the diameter of the wheels, but only at the cost of increased weight and, to some extent, of stability, for the side strains on the wheels of motor-cars when swinging round curves of sharp radius were very great. Another direction in which mechanical invention was required for the wheels of motor-cars and wagons was a shoeing or protection of hard material of easily renewable character which could be firmly and safely attached to the outside of the tire covers.

THE DECORATED "LOCOMOBILE" AT GLASGOW.

A South Australian Motor-Car.

AN Adelaide journalist, who has had an opportunity of judging, writes enthusiastically of motoring in South Australia. At present there are but four cars in Adelaide—Dr. Gault's New Orleans, Mr. F. C. Ayers's Deschamps, Mr. R. Davis's De Dion, with local built body, and Mr. Lewis's car, which is entirely a local product, having been designed and built at the Lewis Cycle Works. Recently the journalist to whom we are indebted for the above interesting particulars accompanied Mr. Lewis on some trial runs. The colonial-made car, which was illustrated in a recent issue, successfully negotiated the old road

to Norton's Summit, which at one point (Belair Hill) is steeper than any other road in the district, and has been ridden by very few cyclists. Dr. Gault's car, which was imported from England, has often been taken up the Belair Hill, which is just three miles long, its best time, it is said, being 21 minutes. Mr. Lewis's car accomplished the journey in 17 minutes, at the rate of 10.59 miles per hour. On the flat the machine, which is of about 5 h.p., is capable of a speed of nearly twenty miles per hour. The return to Adelaide, by a different but hilly route, was also successfully accomplished.

Belt Transmission Experiments.

A SERIES of experiments on belt transmission is at present being conducted at the Worcester Polytechnic Institute at Worcester, U.S.A., by Professors Allen and Furlow. The Alden hydraulic absorption dynamometer is being used in the experiments for measuring power. All the various forms of pulleys used in practice are being experimented with—ordinary steel or cast-iron pulleys, wooden pulleys, wooden pulleys with leather coverings, rubber covered pulleys, steel pulleys with air-holes, and steel pulleys with cork inserts. The last are claimed to be the most efficient of any, transmitting 60 per cent. more power than any other pulley of the same size. The most advantageous belt tensions with the various pulleys are also being investigated.

High Prices and Slow Sales.

IN these days of "small profits and quick returns" motor-car makers must not go far outside the ordinary methods of trade. They must be satisfied with reasonable profits—sufficient, of course, to cover their heavy expenses and the rather uncertain character of the business, but still not beyond reason. In some Continental towns progress has been delayed by agents fixing prices out of proportion to the risks and chances of business. Here the public is not wholly without a notion that excessive charges have been made; the sooner that is dispelled the better for the more rapid advance of the industry.

Exchange Wanted.

A GENTLEMAN in the north of London, who has long been accustomed to drive his pair of horses, has become converted to the advantages of motoring; hence the following advertisement:—"First-class single brougham, rubber tired; also American park phaeton, hooded, rubber tired, new; and nearly new American light artistic van, rubber tired; good horse and harness that fits all three for sale, or exchange for good petrol motor-car, with tonneau or phaeton body." Unfortunately for the advertiser, no motorist is likely to entertain the suggestion, for automobiles are not readily dispensed with by users who have learned to appreciate their many points—quite as numerous as the good points of a horse.

An Automobile Blue Book.

FROM papers to books is an easy stage, and in America the automobile has not only its weekly organs, but it is now to have its annual publications. The Automobile Blue Book is announced, and it will evidently cater for those who are thinking of touring in the United States. Among the contents are descriptions of seventy routes adapted for automobile travelling, and extending in a radius of fifty miles from New York, Boston, Philadelphia, and Washington. There is also to be a list of 500 stations provided with repair and supply facilities. All this is interesting as showing how completely the Americans are going in for the motor-car, and also the great effect that such development will have on the highways of the country. Hitherto the great roads of the States have not been particularly inviting to those who care to travel long distances; the era of improvement has evidently set in.

Eating Oats off Cars.

To accustom horses to motor-cars many suggestions have been made; that carried out by Mr. H. Stratton Bates at Langtons, Alresford, has been very successful. He has invited those of his neighbours possessing timid horses to send the animals to his stable yard. Having started the engine of the motor-car and placed a sieve of oats on the car the horse quickly overcomes his fears, and invariably quickly makes up his mind to eat off the vibrating car. This method is certainly a trial to the horse, and the animal that can manage it successfully should be well behaved and orderly in bearing when meeting automobiles on the road.

Fruit Growers and the Automobile.

THE fruit growers of Kent are not the only people interested in the produce of orchards to whom the automobile is likely to become an indispensable help. In southern California the orange growers have suffered much loss because of the inability of the Southern Pacific Railway to furnish transportation for their oranges, which have rotted while waiting for the railway wagons. It has been decided to get over the difficulty by establishing a service of motor-cars to carry oranges from the groves to the port of Los Angeles, for shipment to Seattle on their way eastward via the Great Northern Railway system. This "jointing up" of rail and steamer facilities by means of the motor-car is likely to be an important development in the future—not only in the United States but also in the old country.

Looking after the Roads.

THAT the management of our public highways will become a question of "practical politics" in the near future none who have watched the progress of the automobile movement can doubt. While they are admirable in many places they are execrable in others, and nothing like uniformity in the condition of surface prevails. In some Continental countries the roads are looked after by the military force corresponding to our Royal Engineers. There is something in the suggestion that we should find employment for some of the Army in the same way. Anyhow the point will be worth considering when the matter has come more prominently to the front.

Helping the Horse.

The occasion of the great annual Horse Show in Dublin has led a leading Irish journal to make some melancholy reflections on "the friend of man." As motor-cars advance in favour the value of the horse for transit and transport purposes will decrease—for which the horse should be thankful. It is pointed out that the "companionship of the horse" is absent in motoring. This, however, is but an incident, and those who are so anxious to have an equine companion can hitch the animal on behind, or have him trotting alongside level with the steering wheel. Such little things must not be used as flies on the wheel of automobile progress.

Education Wanted in Scotland.

How greatly certain Scottish districts are in need of a proper course of automobile education is revealed in the reception at Ayr of the vehicles which took part in the recent trials. According to a veracious local chronicler the natives of the town were not favourably impressed, and "the haggard appearance of the travellers when they arrived shook our faith in motor-cars as much as the drivers themselves had been shaken." We can only say that the men of Ayr had little faith and that their ignorance of the automobile was the most conspicuous display made by them recently. The 1,000 mile tour did inestimable value for the industry in England, and the results of the Glasgow trials are penetrating the minds north of the Tweed. But the work is not yet finished.

ACROSS THE AUSTRIAN ALPS ON A MOTOR-CAR.

ONE of the most pleasant travelling experiences of my life, states Herr Lukacsy Lajos, in the *Allgemeine Automobil Zeitung*, was an automobile excursion across the Alps which I made last summer in the company of Count Stephen Gyulai. Cyclists and automobilists mostly shun the Austrian Alps. Cyclists, because they know what efforts would be required of them in mounting the steep inclines of the mountain ranges; automobilists, because they prefer to travel at a rapid rate, at the same time saving wear and tear on motors and machinery. Count Gyulai's ambition was not dampened by such considerations. On the contrary, his fondest wish was to traverse the Alps where the mountain roads are known to be most steep and arduous.

We started from Vienna in a 12 h.p. German Daimler with three persons on board—Count Gyulai, myself and a *mécanicien*. At an average speed rate of thirty kilomètres per hour we reached Linz, where we spent the first night. Our next stations were Salzburg, Innsbruck, and Landeck. Notwithstanding the hilly roads in this region of salt mountains our average speed continued to be thirty kilomètres. After we had passed Prutz, in the Tyrol, we came in sight of the glaciers, and soon were driving at a comfortable gait over the famous Finstermunz road, the numerous tunnels and wall buttresses of which make this route one of the grandest monuments to road construction. It was a steady incline, but presently, at Reschen, we reached the highest point of this wonderful road, and beheld the magnificent view over the great range of the Ortler mountain. Now we could go at a more rapid pace, and flew on to Prad through the Valley of the Etsch. Toward evening, at a greatly retarded speed, we climbed up to glacier altitude and finally put up for the night at the Hotel Trafoi. In three hours and forty minutes we had covered 102 kilomètres, whereas the stage coach, drawn by five horses in four relays, takes ten hours.

The next day was to bring hard work for our brave motor. We began our ascent of the Stilfser Pass. This famous pass is traversed by the highest macadam road in Europe, and had never before been attempted by an automobile. It was no easy matter to overcome one after another of the many serpentine windings by means of which this high pass is reached. It appeared doubtful once or twice whether the twelve horse power of our motor would hold out until the end.

It is a curious thing when mechanical horse powers succumb to fatigue. There seems to be that same "tired feeling" as in real horses. In such cases the teamster urges his horse with a whip, and we, too, realised that some sort of spur would be

needed. Our method of urging on the motor had the advantage of being quite painless. Count Gyulai would stop the carriage and would let the motor run free at the highest number of revolutions. It worked like a charm. After a few minutes of such treatment our carriage would run up the steep grades as if it never had been tired.

Laymen may not understand how this is possible. The explanation is simple. Of course, much more strain comes on the motor while climbing grades than on the level, so that it soon becomes overheated. The hotter the motor becomes the slower become its revolutions. This likewise retards the revolutions of the pump. The hot water does not flow off and the cold water for cooling the cylinders is slow in coming. It is

at this point that an extra stimulant is needed. By letting the motor run free at top speed the pumping is similarly accelerated. The cold water floods the hot cylinders and cools them off quickly. Thus the motor is once more reduced to a normal temperature and works with fresh vigour.

By such tactics we succeeded in overcoming the long winding gradient of fourteen kilomètres, with a total ascent of 2,000 metres, in one hour and four minutes. At the top we met the carriage of the Heir Apparent of Austria. The Prince was astonished to meet an automobile at so high an altitude, and was still more surprised at the good time we had made. His light travelling carriage, drawn by five horses, had taken five hours to cover the same stretch. Needless to state, we left the Prince's carriage far behind on the way down. Nineteen long kilomètres we coasted down a most beautiful road, giving glimpses into the valleys of Italy.

Our success in crossing the Stilfser Pass made us more enterprising, and we resolved to make a try at the more formidable Pass of Rolle, and thence over Monte Croce to Primolano Borgo. So far we had made our journey without mishap. Shortly

before reaching Borgo, however, we had one piece of bad luck after another. First, the pneumatic tire of the right front wheel gave out, then its mate on the left side. This was the more provoking, since we had carried reserve tires all the way, and had only just left them at Bozen to save weight. Without pneumatic tires on our front wheels, we jolted along our way to Borgo. A beautiful moonlight coast from Borgo down to Bozen, after our reserve tires had reached us, offset all our previous misfortunes.

To add to our enjoyment Count Gyulai's sister joined us at Bozen, and thenceforth we made our journey with a full complement of four passengers. We crossed over to Italy by way of the steep pass of Fugazze. The Custom House officers at the frontier stared at our carriage in open-eyed wonder. It was the first automobile that had ever attempted this steep pass. Having passed the frontier, we coasted down into Italy

BETWEEN AUER AND CAVALESE.

at such a rate that we left a trail of dust behind us as far as the eye could reach—like the tail of a comet. Over the smooth even roads of the valley of the Po we ran towards Venice. At last we reached Mestre, the last stopping place on the Venetian mainland. There we left our car in a well-appointed automobile stable, standing side by side with a Peugeot, a Benz and several motor-cycles.

On our way back from Venice to Vienna we resolved to try issues with the railway. With this end in view we selected a straight stretch from Venice to Toblach through the valley of Ampezzo. It took us five hours and fifty-five minutes to cover the 184 kilometres of this stretch. The railway train, which has to follow a circuitous route, took eleven hours and twenty-seven minutes. During the whole journey of 2,271 kilometres (1,420 miles), we used 360 kilogrammes of petrol, replenishing our stock at all the large towns.

[With the present issue we publish a double-page supplement, on which are given several illustrations connected with the account of the interesting trip over the Alps.]

CONTINENTAL NOTES.

BY "AUTOMAN."

THERE scarcely remains a King or a royal personage now who has not ceded to the charms and delights of motoring. The aged Emperor Francis of Austria, in going to meet his daughter the other day, was met at the station by her, accompanied by her husband, in an automobile. The Emperor did not need to be asked twice to join them, but before accepting the invitation he said, with a laugh, "I hope you won't upset me." Needless to say this hope was realised. The King of Portugal has bought a motor of French manufacture, and may be seen almost daily exploring the country round Lisbon, accompanied by his brother, Don Alphonso. Don Carlos, the pretender to the Spanish throne, has also now become a fervent automobilist. King Leopold the Second, as is well known, has already many cars, but it is now rumoured that he is contemplating the purchase of a 40 h.p. Paris-Berlin type, so that speed would seem to have attracted him. It is said that his daughter, the Princess Clementine, who always accompanies him on his motor-car journeys, is also fond of a good spin.

THE visit of the Tsar and Tsarina to France would, of course, not be complete without a motor-car, and a 20 h.p. six-seated car will be placed at their disposal during their stay at Compiègne. As this car is one which took part in the Paris-Berlin race, and as it is going to be driven by M. Joseph Journu, it looks very much as if it were the car belonging to Baron Von Zuylen. At any rate the description answers exactly, and it was M. Journu who drove the Baron Von Zuylen from Paris to Berlin in the tourist section.

FOURNIER writes a letter from New York, addressed to the *Auto-Velo*, in which he states that immediately on his arrival in New York, and before he could get to his room in the hotel, he was pounced upon by journalists and photographers, and finally induced to sign an engagement with the Madison Square Garden Theatre, where he is to exhibit himself every night. As he has not taken his car yet, the only thing he could do was to mount a motor-bicycle, on which he had a most enthusiastic reception.

THE new French regulations with regard to the running of automobiles in France have now been made public. The principal points are the following:—Automobiles weighing more than 350 kilogrammes, when empty, must have a reverse motion; the certificate of each carriage shall say what speed it is capable of attaining on the level, and if it can attain a speed of more than thirty kilometres in the hour; it must carry two numbers, one in front and the other behind the carriage. A delay of two months is given to the proprietors of cars to have their certificates completed in accordance with the new regulations. With regard

to racing, it is decreed that no racing shall take place in any Department without the consent of the Prefect, the chief of the road engineers, and all the Communes which are passed through. No race shall take place over a course consisting of more than one Department without the consent of the Minister of the Interior, in addition to the consent of all the Departmental authorities. As before, a speed in excess of 30 kilometres may be maintained in the open country, but in no case will more than 20 kilometres be allowed in the "agglomerations." Readers of the *Journal* will notice that these new regulations do not preclude racing, so that we may see road racing coming to the fore again in France. If it does, however, it will be under proper official regulation, which we may be sure will be strictly carried out by the police, and military if necessary.

ON the whole, the new regulations appear to be sensible. It is manifestly absurd that high-powered machines, capable of doing high speeds, should not, as has been suggested by some very ignorant persons, be allowed at all, for the very good reason that, although on such a machine one is not obliged to exceed the legal limit on a flat road, on the other hand, the high power is required in order to be able to maintain the legal limit uphill. If numbering has to be, it is much fairer that a distinction should be made between machines capable of doing high speeds and those incapable. In the recent police court proceedings that have taken place in England, such a distinction would certainly have prevented many cases where a gross injustice has been done to some unfortunate automobilist on a slow car, who has been made to pay for the faults of his more speedy companions.

M. SANTOS-DUMONT has repaired his No. 6 and is quite ready for his run for the Deutsch prize, which he may have gained before these lines are published. There has been an unfortunate dispute between himself and the Committee of the Aero Club, which culminated in a letter addressed by him to that body. Fortunately, everything has been smoothed over, and the Committee has decided that the time occupied in rounding the Eiffel Tower shall be calculated from the moment the guide rope is released at the Aero Club until, after the return journey, the guide rope shall be seized again in the same position. It will not be necessary for the flying machine to come to earth within the time. Everybody will applaud the wisdom of the decision.

M. ROSE has decided to relinquish his attempt for the Deutsch prize for this season. The shareholders of his company have decided to find the money necessary to reconstruct the cigar-shaped envelopes which contain hydrogen, and to remedy some other faults rendered evident by the trials that have been made. The fans which should raise the machine from the ground only turn at 200, instead of 300 revolutions per minute, and the equilibrium of the whole machine has been rendered unstable by the removal of weight from the lower passenger carrying cage. M. Rose is going to pass the winter in making the necessary changes, and hopes by next spring time to be ready for more successful trials.

A CORRESPONDENT in last Saturday's *Journal* calls me to task for my paragraph referring to the Lisieux accident, and tells the story as from the Count de Villeroi. As a matter of fact, in my "Continental Notes" last week I included a paragraph announcing the fact that the author of the accident had been traced, and had voluntarily given 50,000 francs to the widow of the unfortunate employee of the Octroi. This paragraph was, I learn, omitted for want of space. If my account of the accident was erroneous—of which I am not yet convinced—my error was shared by the whole of the French Press, both technical and otherwise. Certain it is that the name of the author of the accident was quite unknown in France for more than a week after it occurred, and, as this does not tally with the account given by "An Occasional Motorist in France," I prefer to suspend my judgment until the facts have been elicited before the Court of Justice, which has the matter in hand.

CORRESPONDENCE.

NOISY EXHAUST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Perhaps some of your readers could advise me if it is possible to lessen the noise of the exhaust in a 6½ h.p. Aster engine fitted to a Gladiator voiturette. I have tried filling the silencer, which is about 20 in. long by 5 in diameter, with iron shavings, but with, I think, very little effect. This noisiness seems to be the only defect in this make of engine, as otherwise I have had no trouble whatever.—Yours faithfully,

A. WILSON.

ELECTRIC IGNITION MATTERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Absence from town has prevented my seeing, hitherto, the letter printed in your issue of August 31st, signed "Rooinek." Whilst thanking your correspondent for drawing my attention to what he assumes to be an error in my book, I would point out that he has evidently misunderstood my meaning. When I said that the route of the wires "is along the frame," I did not intend to imply that the current passes through the frame, but merely that the wires are conveyed alongside or inside the tubes of the frame. But since the wires are insulated wires, the primary current is not earthed at all.—Yours faithfully,

A. J. WILSON.

A LONG RUN ON AN M.M.C. CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having just completed a run from London to Leeds and back, 400 miles, in 24 hours 20 minutes, on a Motor Manufacturing Company's car, I thought you might like a few particulars. Leaving London with a strong head wind blowing in our teeth, we did the up journey in 14 hours, having absolutely no trouble with the engine; it behaved splendidly, never once missing fire or lagging, and took all the hills in grand style. Until we reached Hitchin the roads were very busy, what with the ordinary traffic and the extra traffic for Barnet fair; after that, very clear with a good surface. On reaching Retford we called on Mr. Clark, cycle and motor engineer, for petrol, which was found to be very good and fresh; he evidently gets through a large quantity. He showed us a car that he has just made, and which runs very well. We also saw two of Captain Laycock's cars, which seemed to be running beautifully. Until reaching Doncaster the roads were all that could be desired; after there very loose and bumpy. Reaching Pontefract we found that the main street was up, which added another mile to our journey, as we had to make a long circuit.

The Leeds streets are in a very bad state, which, I think, explains the absence of cars there. There is one thing that attracts strangers, that is horse cars, steam cars, and electric cars on the same lines, but I understand that they will do away with the horse and steam cars as soon as possible. Before leaving Leeds we called on Mr. S. Leuchters, Aire Street, for lubricating oil. He reports steady progress and sales fairly good.

On the down journey, which took 10 hours 20 minutes, we called at Clarke's, close to the racecourse at Doncaster, and found that they stock all requisites for motorists. They also have a good show of cars; one, a 5½ h.p. M.M.C. char-à-banc, to hold nine, built in 1898, is still doing good work. From Retford we had a splendid run through Newark to Grantham over that dreaded Great Gonerby Hill, of which our car made light work, negotiating it in five minutes, and beating some cyclists who rode the whole way up by 11½ minutes. After having something to eat here we started for Hitchin, and then on to town, over the vile pavement of Holloway and Islington. Our journey was finished without a hitch of any kind and no punctures, which speaks well for the condition of the roads generally.—Yours truly,

H. E. WILKINSON.

THE SPRAG DIFFICULTY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of June 29th last, a correspondent mentions a simple device used on the 3 h.p. Gladiator car to prevent the vehicle running back should anything fail when ascending a hill. Would he kindly state where the device can be obtained, and whether it is suitable for any other car?—Yours truly,

M. O.

NOMENCLATURE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When in Glasgow the other week I spoke to many who were engaged in the trials about the word *garage* and other French terms. With scarcely an exception they expressed their detestation of the word. "Car-house" expresses the idea admirably, being English and not in use for any other vehicle. It is generally acceptable, as I have ascertained.—Yours truly,

J. H. A. MACDONALD.

THE LISIEUX ACCIDENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter from "An Occasional Motorist in France" is utterly out of place. The laws of the country are perfectly well known, and it is the duty of everybody to stop at the "Octrois." There is no excuse for the Villeroi family in any way; they should have stopped their motor at once when signalled to do so by the "Octroi" men. The fact of their not doing so at once places them in the wrong. The man, Lucas, killed in such a shocking manner, was doing his duty, and no money, as your correspondent seems to think, will replace the husband and father. "An Occasional Motorist in France" must himself be a reckless and heartless driver to call the dead man "a stupid fellow." The immediate punishment of such drivers at the hands of an infuriated mob will have the full sympathy of every fair-minded man, and I hold that all motorists should obey the law, and, in defying it, they only reap the reward they deserve.

I sincerely hope that the rich Villeroi family will be made to pay the full penalty for breaking the law, and be made to understand that they cannot drive rough shod over inoffensive persons and the custodians of the law. What is stated in your correspondent's P.S. as Count Villeroi facts is open to question.—Yours truly,

A. LITTLE.

AERIAL NAVIGATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—"Automan's" remarks of last week, on the subject of my previous letter, call for a response, which I shall give but briefly. My letter pointedly defined the necessary conditions of a practicable aerial vessel to be comparable with that of the birds "which are roughly 600 times heavier than air." From this, it may be seen at once where "the division between levity and gravity is made," and it is a very wide division. As "Automan" asserts that "the heavier the machine is, in comparison to the air, the greater will be the horse-power required to lift it," he must excuse my telling him that he is wrong in his premises, inasmuch as the weight or gravity of the machine is a source of power in itself, and indeed in soaring and sailing birds is the main source of power, as I have also remarked previously, and could easily demonstrate. Touching the penny balloon and pigeon simile, which "Automan" ascribes to the levity advocates, —has hitherto been quoted by the aviationists, or gravity advocates, in illustration of whose arguments (in condemnation of balloons)—it is quite apposite.

Having earned the right to speak authoritatively on this subject, I assert emphatically, and will maintain that there are no "delusions" in the theory of the aviationists to be "exploded" either by M. Santos-Dumont or anyone else. "Automan" cannot have informed himself of the practical results achieved by the aviationists, or he would never have ventured on an assertion so easily controverted, as when

he remarks, "they have failed absolutely," and have but "a barren field." Let "Automan" ascertain what has been done in steam flight by Professor Langley and Lawrence Hargrave—to say nothing of Hiram T. Maxim—and in soaring flight by Lilienthal, Chanute, Pilcher, Herring, and Le Bris. It is to be regretted that "Automan" should so write without having duly posted himself on the subject, as it is such random assertions that injure the legitimate cause, and mislead the uninitiated general public.—Yours faithfully,

SIDNEY H. HOLLANDS.

THE GLASGOW RELIABILITY TRIALS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very pleased to notice a letter written by Mr. Carlisle in your last issue in regard to the Automobile Club's Trials in Glasgow, and the withdrawal of the Whistlefield Hill climb from the competitions. It seems to me a great sign of weakness that a trial on a hill on an ordinary main road in Scotland should have to be withdrawn, and I think some explanation is due to the public for this withdrawal. It is not much use having trials if a hill can be found which the ordinary car sold to the public will not climb.

I have always been under the impression that the Automobile Club was an independent body, but it seems in this case as if they withdrew the hill from the competition so that the weakness of some cars should not be shown up.—Yours faithfully,

A. NOBLE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with much surprise in your last issue that a correspondent suggests that some portion of the Automobile Club Trials was abandoned. No doubt many others are in the same position as myself, waiting for the result of these trials before deciding on a motor-car for next year; and it seems to me that some explanation should be given to the charge brought against the Automobile Club in your last issue.—Yours truly,

DENHAM JONES.

THE AUTOMOBILE MUTUAL PROTECTION ASSOCIATION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The Executive Committee of my Association wish to give prominence by means of your valuable paper to the attempt which is being made by the Cycle Manufacturers' Association to upset the very wise decision which was arrived at after two meetings called publicly by the Automobile Club, and which the trade were invited to attend. At these meetings the trade decided unanimously that there should be only one motor-car show annually, and that this should be held for the next two years at the Agricultural Hall, in the spring of the year.

In the *Cyclist* of September 18th there appears a proposal of the Cycle Manufacturers' Association for the amalgamation of the cycle and motor trades with a view to stultifying the effect of the decision above referred to. The so-called favourable opinions of the "trade" cited include those of tailors and others, who are not in any way entitled to speak either for motor manufacturers or agents, and there is practically a total absence of favourable opinions in the list published from motor manufacturers and agents.

The Automobile Mutual Protection Association, Limited, which has been in existence for some considerable time, and which includes amongst its members a large majority of the well-known firms of motor manufacturers and agents and several prominent users of motor-vehicles, has taken in hand the protection of its members in matters relating to patent rights, royalties, etc., and has already been of great service to the movement in freeing it from vexatious litigation. The Executive Committee of the Association strongly urge the trade to keep quite clear from any amalgamation with the cycle industry which can only be advantageous to the latter, at the expense of the former.—Yours faithfully,

GEO. R. HELMORE, Secretary.

THE ROOTS AND VENABLES CAR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Not seeing any reply as to a difficulty in starting a Roots and Venable motor, I venture to suggest that the collar mentioned is the cause. If overheating of the tube was what made it fire too soon I should have tried a different tube, or less pressure on the lamp. I have used a Vosper launch engine (Roots' patent, I believe) for four years in a small auxiliary yawl, and never give more than three turns of the fly-wheel to start it after the tube is bright and the pipes hot. Should the engine not start once in a way the tube is left to heat longer, and three quick turns afterwards given. I not infrequently run five to twelve hours continuously. I carry two spare "Aetna" lamps, nipple key, spare burners and nipples. The pumps have never given trouble; all parts are interchangeable in the three lamps, and spare parts can be procured ready made for a few pence. After long use the burners should be cleaned by someone who has the apparatus for heating them and blowing out the carbon. Of what metal is the tube which fired too soon? I have not found any which got too hot, but probably the marine cylinder is kept cooler.—Yours truly,

PETER OLIV.

WITH regard to the paragraph in our last issue taken from the *Express*, anent a race between a Panhard and Renault car from Paris to London, in which the suggestion was made that the race had practically to be abandoned because the cost of the duty to bring the Panhard back into France would amount to £600, Mr. S. F. Edge writes, stating that there is not the slightest truth in the statement that it requires £600 to take a Panhard into France. To start with, it is only necessary with a French made vehicle to have it sealed at the Customs, and it can then always go backwards and forwards as often as the customer likes without any payment whatsoever. Even supposing this formula is not complied with, it is only necessary to pay not more than £30 duty on taking it into France.

As the result of a police raid, about thirty motorists were summoned at the Reigate County Bench on Saturday last for furious riding, and in most cases fines were imposed.

THE Hon. C. S. Rolls was to make a long distance balloon ascent on Thursday, accompanied by Mr. Frank Butler, Miss Vera Butler, and Mr. Percival Spencer, but at the last moment the trip was postponed.

THE Wolverhampton Art and Industrial Exhibition appears likely to be a great success, as many leading firms are making applications for space for a large display. Special arrangements are also being made for the amusement of visitors.

MESSRS. WEBSTER AND BENNETT, of the Atlas Works, Coventry, are issuing a very complete and well-illustrated catalogue of the machinery and tools turned out at their works. Amongst these motor-driven machine tools figure prominently. A list of some of the recent users of the firm's tools contains so many well-known names that it should carry conviction.

MR. F. L. ANDERSON, of 1, Furnival Street, E.C., informs us that, in anticipation of any difficulties in obtaining the necessary gearing, he is now prepared to quote for an efficient and easily fitted front wheel drive for Dr. Winter's speed indicator. A delivery of the instruments is due within the next fourteen days, so that the greater part of the unexecuted orders will be promptly dealt with.

DURING the course of the week, Mr. Weigel, of the British Automobile Commercial Syndicate, Ltd., has been to Newhaven, to bring two 24 h.p. Panhard cars to London; one of which has been sold to Mr. Garland, an American gentleman, and the other to Mr. Eric Chaplin, the nephew of the Duke of Sutherland. The company also inform us that during the week they have, in addition, received the following Panhard cars:—Four 5 h.p., three 7 h.p., one 12 h.p. and one 8 h.p.

FLOTSAM AND JETSAM.

—BY "FLANEUR."

"PUT not your trust in horses" may well have been the cry of the beautiful Duchess of Sutherland, who has been thrown and trampled upon by an equine quadruped just after she had quitted a motor-car, which had carried her from Laird to Tongue. The Duchess is very fond of exploring the wilds of Sutherlandshire and Caithness, and before the Duke acquired his motor-car her Grace used to take long rides alone on a very high-framed bicycle, for she is a magnificently proportioned woman of over six feet in height. Her nerve and daring are superb. In the course of my wanderings I once found myself at the extreme northern fringe of Scotland, and was shown over Dunrobin Castle by reason of a special order which the Duchess was kind enough to send me herself. While rambling along the coast I came across break-neck hills down which, I was assured by eye-witnesses, the Duchess was wont to "coast," although even the average male rider would elect to walk down gradients of such severity. It was apparently this same desire for exploration that has led, but by other means, to a lamentable disaster. Her Grace had been driven in a motor-car to Tongue, and was crossing to Loch Choire on horseback over a mountain road. The horse struck some marshy ground, became restive, and threw the Duchess, not content with which the animal trampled on her leg. Now a horse may do this sort of thing at any time; but what if the position had been reversed? Supposing that the Duchess had left the horse and mounted a motor-car, and some quite exceptional mishap had occurred. Is it difficult to imagine the head-shakings and "I told you so" ejaculations that would have been forthcoming from anti-automobilists on every side?

"HIP and thigh" did the Lord Justice Clerk smite Sir Howard Vincent in the *Times* controversy on "Motor-cars and horses." The member for Sheffield has rarely shown to less advantage than in his letter, in which he clamoured for a £5 tax on all automobiles, and bewailed his own position when driving a wagonette full of ladies with a horse which would not pass a car. He ended by invoking the aid of Mr. Walter Long, "who is a horse-owner and a sportsman, and horse-owners look to him." The Lord Justice Clerk's reply was simply crushing. He backed with his weighty authority and extended experience the statement that not one horse in 200 took any notice of motor-cars. "If Sir Howard," he added, "had a horse that could not be trained to bear railway traffic he would sell that horse or take his chance. He must do the same with a horse that could not be trained to motor-cars." As for the £5 tax, no tax, he urged, would make it safe for a man to drive a wagonette full of ladies with such a horse in it. The appeal to Mr. Long he answered by scouting Sir Howard's implied suggestion that the President of the Local Government Board would act with partiality because he kept horses. "If horse-owners look to him to do injustice because they keep restive horses I am certain that they will look in vain"—which is as neat a phrasing as could possibly have been desired. Finally the Rt. Hon. Sir J. H. A. Macdonald grassed his adversary most beautifully with this parting shot:—"Sir Howard's proposal to load one mode of locomotion with excessive taxation because there are some offenders is much the same thing as if someone were to ask the Chancellor of the Exchequer to put a heavy impost upon Sheffield cutlery because there were a few cases of stabbing in the newspapers." And what would Sheffield say?

It was by a somewhat curious coincidence that at the very time an illustration was being published in this journal of the new motor-car service at Cortina (*vide* page 521 of last week's issue), I myself happened to be at that very spot. And a lovely spot it is, right in the centre of the wondrous Dolomite region. I have never seen, in the whole of Switzerland or Austria, a place that has grown to the size of Cortina, with numerous shops and hotels, and yet retained so much of its picturesqueness and primitive simplicity. The new motor-car service has caused a

terrible flutter in the dove-cotes, but there is little fear of the innovation not meeting with the success that it deserves. The road over which the cars travel is magnificently graded, and has a surface that would make most English surveyors green with envy. There is fine scope, by the way, for automobile touring in the Tyrol. The roads are in many cases super-excellent, and the scenery superb, while there is nothing in the way of gradients that a good car could not surmount with ease. Mountainous districts abroad, it must be borne in mind, do not present the difficulties that "hilly" routes so frequently do at home. England is full of places where no science has been brought to bear upon road construction, and, instead of skilful windings, the primitive straight line is again and again employed, and gradients of one in eight are the result. Now on the Alpine routes, where roads have been mathematically planned, one never sees aught steeper than one in twelve, and often the ascent is no worse than one in twenty. Moreover, there are no sudden corners; all are scientifically made, and although they may double back like the curve of a horse-shoe, you can see exactly what you have to negotiate three hundred yards away, and can adapt your speed accordingly.

LET anyone who wants a grand trip, amid glorious surroundings, drive from Innsbruck over the Brenner Pass to Franzenfeste, thence to Toblach, and over the fine Ampezzo Road, through Cortina to Belluno. From Belluno there is a grand road to Feltre and Trient, and more of splendid going over the Tonale Pass to Edolo, and thence over the South Aprica Pass, with a surface like a billiard-table, to Tirano. Here the famed Stelvio Pass can be ascended, and the journey continued northwards through Trafoi—one of the most beautiful places in the world—to Mals and Landeck. This round not only embraces some of the finest scenery in the Alps, but is all outside the boundary of Switzerland, and not "taboo" to automobilists. Motor-cars, I may add, though suffered to "circulate" in Swiss towns, and along ordinary road routes, are rigorously excluded from the Passes, and I venture to predict that it will be a long time ere the embargo is removed. If the horse is sacrosanct in England, it is doubly so in the Alps. But I will also predict, with equal confidence, that the day will come when the Government mails will be carried over the Passes by self-propelled vehicles, and the lumbering diligence, with its five-horsed teams, will be relegated to limbo.

A GOOD many people, by the way, have been driving motor-cars of late up Alpine Passes, and each in turn is claiming to have ascended higher than anybody else. As a matter of fact the record in this line was broken several months ago, and once broken it must stand good for all time. You cannot make a new Pass every day, and no one can eclipse the performance of the man who first ascended the highest road of all, for the simple reason that there is no higher route to follow. All you can do is to beat his time, if recorded. Now, the highest carriage road in Europe, or, indeed, in the world, is the Stelvio Pass, which is half in Austria and half in Italy, though closely adjoining Swiss territory. It rises to a height of 9,055 feet, is magnificently engineered, and has a perfect surface throughout. The first person known to have driven over it on a motor-car was an Austrian noble, Count Stephan Gyulai, who crossed it on a 12 h.p. Cannstatt Daimler. [A description of this journey, with several photographic illustrations, appears in the current issue.—Ed. *M.C.J.*] Consequently, the various gentlemen who have been climbing up to heights of six, seven, or eight thousand feet, as the case may be, on other Passes may have done meritorious performances, but made the highest ascent they certainly have not—a fact which I may commend to the attention of the *New York Herald* (Paris edition), a paragraph in which, while I was abroad, greatly amused me by the claims it set forth on behalf of some *chauffeurs* who had driven up the Great St. Bernard.

MR. HOLDEN, of Eastwell Park, informs us that Albert Holmes, who was fined last week for furious driving, is his coachman, and not his engineer, as stated in our last issue.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

THE "CHARETTE" PETROL CAR.

AS mentioned in a recent issue, the International Motor-Car Company, Limited, of High Street, Marylebone, have lately considerably improved the "Charette," which they introduced about a year ago. We are now able to give illustrations and a brief description of the vehicle in its

FIG. 1.—GENERAL VIEW OF THE "CHARETTE" PHAETON.

latest form. Hitherto two sizes have been made, one fitted with a $3\frac{1}{2}$ h.p. engine, and the other with one developing 6 h.p. From Mr. Seyd we learn that the company have decided to confine their attention to the latter class.

The motor is of the vertical single cylinder type on the De Dion system. It is located in the fore part of the frame under a bonnet which can be readily detached. The motor itself contains a number of commendable features, the chief among which being that in addition to the cylinder, both valves, which are on top of the motor, are entirely water-jacketed. The engine does not run at a high speed, a rate of 800 to 1,000 revolutions being sufficient to develop its full power. The water circulation is maintained by a pump driven by a band off the engine shaft, and a radiator is fitted in front of the vehicle. The engine is started with the usual handle, which is fitted at the side of the car. The exhaust is carried to the back of the car, and is very quiet. The ignition is, of course, electrical, and it is of a simple kind, which enables the makers to claim that it will rarely give trouble. Coming now to the transmission gear, three speeds and a reverse motion are available, and any speed from two to thirty miles can be attained on good roads, the entire regulation of which is actuated by levers on the steering column. The power is transmitted from the pulleys on the motor shaft by one of two wide belts to a countershaft in the rear, which is geared to the live axle by

means of toothed wheels, which run in an oil bath. In the standard car a powerful band brake on the rear axle, operated by pedal, is fitted; a hand brake actuating band brakes connected with the hubs of the rear wheels can be fitted at a slight extra cost if desired. The axles, framework, and steering connections are very strongly made, the connection between the steering standard and the rod being by rack and pinion. The road wheels are of the cycle type shod with pneumatic tires of a special kind, with which the makers give a guarantee, a point which will be appreciated by those who have experience of the incessant repairing of pneumatics. The body can be removed in a few minutes, thus giving access to the whole of the transmission and gearing beneath the floor, whilst the back seat can be detached separately and the space used for luggage if desired. The standard form of a "Charette" is a spider with accommodation for three or four persons; the under-carriage carrying the motor and the whole of the transmission gear, any type of body can be fitted, and the International Company inform us that they can undertake to meet customers' wishes in this

respect by fitting a phaeton, tonneau, or even a small omnibus body at a cost of not more than ten guineas over the price of the standard car. They are also open to supply complete under-

FIG. 2.—FRAME OF "CHARETTE" CAR.

carriages to coach builders, to which the latter may fix bodies of their own construction. An interesting feature of these cars is that every one is run by road from Coventry to London (ninety-seven miles) with a non-stop run before it is passed and handed over

to the carriage-building department. Mr. Seyd also informs us that his company now offer to send a "Charette" to any part of England or Wales free of charge for any intending purchaser to test at his door over his own roads. This is one of the boldest offers we have yet heard of in the motor industry, and shows that the International Company have great faith in their vehicle.

On another page we give an illustration showing the interior of the International Motor Works at Coventry. They cover nearly an acre of ground, all under one roof, and here every branch of the motor industry is carried on. Wherever possible automatic machinery is employed, thus making as many parts as possible on the interchangeable system.

HERE AND THERE.

THE Roads and Bridges Committee of the Glamorgan County Council have withheld a grant to the Merthyr District Council on account of the bad state in which the roads in charge of that local body are maintained.

MOTOR-CARS will be used in the Imperial German manoeuvres in the Dantzic district. Ten have already arrived. They are of various patterns, from the lightest passenger carriage to the heaviest freight wagon. One of the vehicles is intended for the use of the Kaiser.

A YOUNG Birmingham engineer, named Parsons, aged 24, shot himself dead recently with a six-chambered revolver. The reason assigned by his father was that the young fellow had been lately devoting all his spare cash, time, and energy to constructing a motor-car, and he had been greatly distressed because he could not make the machine go properly.

A DASHBOARD voltmeter is one of the latest useful novelties to be put on the market by the United Motor Industries, Limited. The voltmeter is mounted on a small board and can be screwed to any suitable part of the dashboard of a motor-car. It is arranged to be permanently connected up to the accumulators, so that by means of a push switch on the board the motorist can at any time instantly ascertain the voltage of his batteries. The voltmeter registers up to five volts in tenths.

ACCUMULATOR INDUSTRIES, LIMITED, has been registered with a capital of £40,000, and the directors are inviting application for 2,000 7 per cent. cumulative preference shares of £5 each. The object of the company, which has established works at Woking, is to manufacture and supply "Leitner" accumulators for light railways, tramways, omnibuses, launches, motor-cars, etc. The present subscription list is open till Friday, the 27th inst., and the registered office of the company is at Maybury, Woking, Surrey.

At a meeting of the Team Labour Committee of the Southampton Town Council last week the Town Clerk read a letter that he had addressed to the firms competing at the recent Liverpool motor-wagon trials, and the replies received in answer thereto. It was resolved that the Town Clerk be directed to write to the local authorities using motor-vehicles inquiring as to their suitability for municipal work, and whether they had found the vehicles a means of saving time and labour, and also a success financially.

AT Blackpool, recently, H. F. Lowe was charged with stealing a bicycle from the lobby of the Station Hotel, the property of Mr. J. H. Robinson. On Thursday, August 22, Mr. Robinson left the machine in the lobby, and soon afterwards the prisoner was seen to take it away. Prisoner, who said he was publishing the *Automobile Journal*, pleaded guilty, and Mr. Callis said it was nothing more than a drunken freak. Prisoner's wife, who spoke with a strong American accent, said the first issue of the journal was published in London, and the second issue would shortly be published in Preston. The Mayor said they had given the prisoner every chance of calling witnesses, but he had not done so, and the least they could do was to send him to prison for 14 days.

A NEW company will shortly be registered, with a capital of £100,000, to exploit electric and petrol (German) motor-vehicles.

FIVE motorists have to appear at Spittlegate Petty Sessions, Lincolnshire, to-day (Saturday) to answer summonses for furious driving, ourselves amongst the number.

MESSRS. JAMES RICKARDS AND Co., of the Motor Works, Brentford, Middlesex, are turning out in large quantities a small petrol motor for use on motor-bicycles.

MISS BALFOUR is rapidly becoming an expert automobilist, as she is driving her brother's (the Rt. Hon. A. J. Balfour) De Dion voiturette herself in the neighbourhood of Prestonkirk, where they are staying in Scotland.

THE General Automobile Company, Limited, has been registered with a capital of £100, to acquire the goodwill, assets, and contracts obtained by W. C. Bersey on behalf of the company, and to carry on the business of dealers in motor-vehicles, etc.

THE motor-car has again made its appearance on the stage, and will shortly be seen running nightly across the boards of Drury Lane, in the sensational spectacular drama, "The Great Millionaire," now in course of preparation.

MR. F. SADLER has recently devised and patented a motor road cleaner, which, it is claimed, is capable of doing the work of ten men; also of clearing away snow. It is worked by electricity, and the cost is estimated at 1½d. per unit.

THE accompanying illustration shows the 9 h.p. Napier car, 1902 model, which ran in the Glasgow trials. The car is fitted with a single lever for the control of all speeds, backward and

forward, and also a new type of governor, doing away with a very large number of moving parts, and reducing the governor to a plunger, which cuts the mixture outlet on or off.

CANNOT some Bristol motorist take the Lord Mayor of the town for a trip and convert him. In the course of his welcome to the members of the Institute of British Carriage Builders on Tuesday, he remarked that he viewed with alarm the popularity of motor-cars, and said he hoped it would be his good fortune to have passed away before motor-cars became generally used.

THERE can be no doubt that the fashionable mode of exercise—call it recreation, or sport, or craze, or what you will—is automobilism. Already it has added several new words to the English language, and has given rise to a new and flourishing branch of English industry. To what lengths its beneficent influence will extend it would be difficult to say, but its universal adoption, especially by those who live in the outer radius of town, is only a matter of time and price.—*The Court Circular*.

THE General Electric Company (1900) Ltd., of Queen Victoria Street, E.C., in issuing their sixth edition of this year's illustrated catalogue, have not overlooked the requirements of motorists. Several pages are devoted to the many accessories of an electrical order without which no car is complete. Besides the usual sparking plugs, coils, dry cells, batteries and accumulators, there are many other interesting little novelties such as the "Search Light" lamp, which can be lighted from the ignition battery and is useful for inspecting gear, etc., after dark.

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

WE hear that a motor-car tour through France will shortly be undertaken by Lady Maud Warrender, who will be accompanied by Miss Marie Hay.

AN appreciative notice of the career of Mr. John Stirling, managing director of Stirling's Motor-Carriages, Limited, appears in a recent issue of the *Glasgow Bailie*.

BEFORE the engineering section of the British Association, Mr. C. B. Garrard, of Birmingham, read an interesting paper on "Some Recent Developments in Chain-Driving," a large part of which was devoted to the Renold silent chain.

THE Motor Haulage Company, Limited, has been registered with a capital of £15,000, to carry on the business of engineers, makers of motors, motor lorries and cycles. The registered office is at Donington House, Norfolk Street, W.C.

THE Wellington Rural District Council has decided to support the Long Ashton Rural District Council's resolution in favour of restricting the pace of motor-cars and licensing and numbering the same.

No response has been received by the Reading Automobile Club to the suggestion with regard to lady-associates. Evidently lady motorists are motorists "in their own right," and do not care for the nominal association with the other sex.

MOTORISTS should be particularly careful when driving in Buckinghamshire. Some of the roads about High Wycombe are very narrow, and have several curves in comparatively short lengths.

THAT the recent automobile jaunt into Scotland has done good is attested by the *Glasgow Evening News*, which says: "Those dusty, set-faced beings (the motorists), masked and begoggled, are the advance agents of a time beyond ours."

PORTSMOUTH AND GOSPORT MOTORS, LIMITED, has been registered, with a capital of £5,000, to establish and maintain services of motor-omnibuses, cars, and to carry on the business of electrical and general engineers, etc.

WE have received a copy of the *Auto-Era*, a new monthly published by the Winton Motor-Carriage Company of Cleveland, U.S.A. While naturally the Winton car claims chief attention, there are a number of interesting items in the new journal.

AS will be remembered, the petrol consumption trial of the Reading Automobile Club was unavoidably postponed. The Committee have now decided to hold it on the 22nd inst. The event is open to all automobilists, whether members of the Club or not.

GEARINGS, LIMITED, has been registered, with a capital of £3,000, to adopt an agreement with F. W. Dunlop, and to carry on the business of engineers and manufacturers of cycles, motors, etc. The first directors are P. Stanley, T. L. Drimmie, and F. W. Dunlop.

FOLKESTONE seems inclined to welcome the vehicles of the Folkestone Motor Company, and local residents are remarking upon the large number of private motor-vehicles that are running in the district—some of them owned by people living in Folkestone or Hythe.

THE Electric Ignition Company of Highgate Square, Birmingham, inform us that they are now prepared to supply a new single-pole sparking plug with flange to suit the Benz engine, also a flange screwed to take the De Dion type plug, and so suit the Benz.

ALLEGATIONS against the Worcestershire police in waiting behind hedgerows to summon cyclists riding on the footpath at a place where the road was "up" are to be investigated by the Standing Joint Committee of the county. Similar way-laying with regard to motorists elsewhere should also be considered by local authorities.

MR. P. DRUMMOND, of Stirling, met with rather a serious accident while riding his motor-cycle last week. Near Carret Farm the machine overturned and Mr. Drummond was thrown to the ground, sustaining injuries to his head, whilst one of his shoulder blades was also hurt. He was picked up in an insen-

sible condition, and removed home. We are glad to say he is now recovering satisfactorily.

IT is only a few weeks ago that Mr. McKinley, the deceased President of the United States, took his first ride in an automobile at his home in Canton, Ohio. He rode out with Mr. Z. Davis, one of his neighbours, who drives a Winton car. At the conclusion of the ride, the President expressed himself as highly pleased with the vehicle and the skilful manner in which Mr. Davis handled it.

A MOTOR-CAR built by the Searchmont Motor Company, of Philadelphia, Pa., was recently delivered to a purchaser in Baltimore, having travelled the 180 miles over the Blue Ridge mountains under its own power. This route has, it is stated, never been successfully covered before by an automobile. A very pleasant feature of the trip was the ice chest, which was built on the car, and furnished ice water and other cool drinkables along the route.

FROM Messrs. Burberry's, of Haymarket, London, we have received a sample of "Gabardine," a material particularly adapted to the requirements of motorists. Its thick woolly back offers warmth without weight, whilst the closely woven surface is impervious to dust, wind or rain. It is an excellent material for suits, but its most important use is for the "Slip-on" coat and overalls which fit easily over an ordinary overcoat or other garments.

GREAT complaints are made respecting the speed of motor-cars in many parts of Cheshire, and some of the local authorities are now taking up the matter. The Bucklow Rural Council has received complaints, and has decided to call the attention of the County Council to the great and increasing danger, and to ask that body to compel all motor-car drivers to carry numbers or exhibit other means of identification. The police are also taking more determined action.

UNDER the chairmanship of Colonel G. Montagu Hicks, a smoking concert was held on Monday last at the club house of the Automobile and Sports Club, Croydon. Secretary R. J. Cholmeley, B.A., had sought most of the musical talent at the Savoy Theatre, and the result was worth the enterprise. The programme was pleasantly broken by a champagne supper, given by the Club. We found the premises very comfortable and well suited for the purpose of the Club, and we understand that an extensive garage for the motoring members will shortly be added.

"THE DARRACQ AND ITS MANAGEMENT" is the title of a little handbook which has been written by Mr. Archibald Ford, of the Motor-Car Depot of Liverpool, to enable purchasers to get the best they can out of their cars of this type. The book is concisely written, but, notwithstanding this, it contains a large amount of most useful information. A number of drawings are given, so that the construction of the machine can be easily followed, although we might add that the value of these would have been increased had the reference lettering been in English instead of French. The work concludes with a series of very plain instructions to enable the novice, who finds his car is not going so well as usual, to locate the cause of the sluggishness.

A NEW differential locking nut has lately been introduced by Mr. C. W. Wall, of 19, Pinfold Road, Streatham, S.W. The nut is internally screw-threaded to fit the bolt in the usual manner, but is also provided with an extension or sleeve, which is externally screw-threaded with a thread of different pitch, from the internal thread. Upon the sleeve is screwed a collar. The arrangement constitutes a differential screw nut, as when the collar is brought up against the body to be held by the bolt, by continuing to screw the nut a differential action takes place whereby the nut is securely locked. Owing to the power obtained by the differential threads, the use of a spanner or other tool can, it is claimed, in many cases be dispensed with, as the nut can be locked sufficiently firmly by hand. In such cases the nut can be made with wings, milled edges, or any devices which will give a firm grip. In using the nut, the collar has to be slightly unscrewed in order to leave sufficient play for the action of the differential threads.

GLASGOW RELIABILITY TRIALS.

We have received a number of communications on the subject of the Glasgow trials from various firms in the trade, a summary of which is given below.

The Wolseley Tool and Motor-car Company, Limited, ask us to state that their 10 h.p. car (No. 10) carried four passengers during the recent trials, and not two as mentioned in the tabular statement of results issued by the Automobile Club.

The Locomobile Company of America write:—We shall be glad if you will kindly publish the fact that, as our marks in the Glasgow Trials may appear low on the list, it is not owing to the fact that we had any stoppages for repairs, etc., but simply that the rules demanded that one mark be deducted for every minute stopped, no matter what the reason. Therefore, we may mention that our car succeeded in doing the test of 500 miles without any stop for repairs or adjustment to engine, etc., the only stops being for fuel and water.

The success of the M.M.C. van in the trials is likely to result in bringing motor vehicles more into commercial use. The Motor Manufacturing Company, Limited, have already a good many vans running about, Messrs. Gardiners, the great clothiers, being among the latest recruits.

stand that we feel annoyed about this, as in comparing the marks given to cars for hill-climbing the public would infer that the "Argyll" was only a fourth rate car, whereas in climbing Whistlefield with four passengers it easily led every petrol car in the competition for hill-climbing.

Mr. S. F. EDGE writes:—Referring to the recent Reliability Trials, my company entered and ran a 9 h.p. Napier, which, as you are aware, received the maximum possible number of marks each day for reliability, never having once stopped except under instructions from the observers. We have, however, one very serious complaint to make against the management of these trials, and that is the withdrawal of the steepest hill climb from the competitions. Our great claim is that our standard motor-carriages will go up every hill to be met with on ordinary roads, and we sent a carriage to the trials which would do this. To suddenly withdraw the steepest hill from the competition, without advising the manufacturers interested, seems to us to require some explanation; otherwise, it is likely to be inferred that the withdrawal of this climb from the competition was promoted by too kind a regard for some vehicles which were not capable of climbing it, and, judging by the appearance of the results, it does seem that a large number of the vehicles entered for the competition were not suitable—at any rate, for running in Scotland—as they failed to climb Whistlefield Hill without their passengers dismounting, and actually

VIEW IN THE INTERNATIONAL MOTOR WORKS.

The 4½ h.p. De Dion-Bouton voiturette did exceedingly well in the trials, as in the five days' run, for which a total of 1,500 marks were awarded; it only lost two marks, which represents two minutes' stoppage. In the hill-climbing competitions it did equally well. Seeing that the car was an ordinary one taken from stock, its performance is very creditable.

The Hozier Engineering Company, Limited, write:—We would take this opportunity of pointing out that when the rules of the Committee were received, these were carefully studied by us, and we could not see any clause wherein it was stated that any advantage whatever would be gained through having a speedy car. We therefore took pains to have our car so geared that it would climb the most difficult hill in all the routes, namely, Whistlefield. You can readily understand it was a great disappointment to us when this competition was withdrawn at the last minute without any satisfactory reason being given. We maintain that all the cars in the competition which failed to climb Whistlefield with their full complement of passengers failed to comply with the very spirit of the whole competition, and demonstrated that there was an error in the gearing of the cars for the work which they were intended to do. All competitors were in possession of the full knowledge that Whistlefield was to be one of the hill climbs, and the contour book gives the grade of the hill. You will readily under-

pushing the cars up. It seems to us a little unfair that we should not have some advantage from sending a car to the trials which was able to go successfully through every trial set forth in the original itinerary.

MR. GEORGE ACE, of Tenby, is just now on his holidays, and intends riding a motor-cycle, made by himself, over the Land's End-John o' Groat's route. He proposes to make a fast journey, but is not ambitious enough to go for a record.

THE Southampton Town Council have had one of their public service motor-cars in use for a short time. The vehicle has, however, been taken off the road until the second and third cars are delivered. The service will probably be restarted next week.

MR. J. T. SCARBOROUGH, of Birmingham, showed us something novel and apparently good in the way of a carburettor specially adapted for motor-bicycles the other day. It consists of a simple device controlling the supply of petrol by means of the inlet valve.

"LOYALTY TO THE TRADE."

SOME few days ago a contemporary issued a circular to the motor trade, calling attention to the fact that the Cycle Manufacturers' Trade Protection Association had decided to invite the motor trade to amalgamate with them, and asked them to write in reply and express their opinions on the subject. These opinions appeared in the *Cyclist* Trade Supplement on the 18th inst., together with a copy of the following letter addressed by the Association to the members of the motor trade:—

13th September, 1901.

Dear Sir,—A meeting of the motor trade has been arranged for five p.m. on Wednesday next, the 18th inst., in the Arbitration Room of the Inns of Court Hotel, Holborn, London, when I trust that you will attend and express your views upon the course you deem it best to take in its interests. The committee of the Automobile Club have also been invited.

My part in the matter is this: On the 20th August I was unanimously elected president of the Cycle Manufacturers' Association, and the forward policy which I have always advocated was endorsed.

For the purpose of carrying out the latter I have during the last few days seen a number of motor-car manufacturers and their representatives, who are not also cycle manufacturers, and found them disposed to join our association if its scope was widened by admitting them to its benefits, and giving them adequate representation on its committee. To this I have every confidence the members of my association will agree at their next meeting on the 25th inst., and that the title of the association will be altered to, say, "Cycle and Motor Trades' Association."

A deputation from my association, which met the committee of the Automobile Club lately, were informed by the latter that the "boycotting" resolution, apparently specially directed against the February show at the Crystal Palace, but which also applied to the "National Cycle and Motor Show," was voted upon by members of the trade only, and therefore the trade alone must rescind or alter that resolution if they wish to do so.

I note that Sir Edward Jenkinson, who was chairman of the meeting which passed the boycotting resolution, represents the Daimler Company, which did such good business at our last show that, with other motor companies, it contracted with us for the same or a larger space at our next show. Also, that no member of our association—a number of whom are also motor manufacturers and members of the Automobile Club—was present at that meeting.

Our show is held by the trade for the trade, and its funds are used entirely in the latter's interests. Many very important matters, some affecting patent rights, royalties, etc., have been amicably and satisfactorily settled by my association without publicity or expense, and during the last eighteen months alone an important action (of which I enclose report) brought against one of its members, but affecting the whole cycle trade, has been successfully defended in the Law Courts and the Court of Appeal at an expenditure of nearly £1,000 of the association's funds, while two very similar actions brought against other parties resulted in both of them being condemned in heavy damages and costs.

Our show, like the French show, is held at the right time of year, when motor makers, as well as cycle makers, desire orders to keep their works going during the winter, and prepare for delivery in the spring and summer. At our last show we were assured by the motor makers exhibiting there that the business done was good, and members of our association, who are also motor-carriage makers, inform us that they received from seven to eleven times as many orders for motor-carriages at our show as at that held in May last at the Agricultural Hall, and all these members, with others, will exhibit at our next show.

My association fully recognises the good and costly work done by the Automobile Club, which has so much benefited the motor-carriage industry, and we are most desirous of acting in harmony with and supporting the Club.

Should the motor trade decide to join our association and exhibit with us at the Crystal Palace from November 22nd to 30th next, my association will subscribe £100 to the Automobile Club.

Also, I have every reason to believe that if this amalgamation takes place, the February show will not be held, and it will be for the trade to decide what show or shows shall be held after May next, and whether the above, or a larger amount, shall be handed yearly by us to the Automobile Club to assist in paying part of the expenses it incurs in organising motor-car trials, etc., which so largely benefit the motor trade.—Yours truly,

FRANK BOWDEN,

President Cycle Manufacturers' Association.

Mr. Frank Bowden, President of the Cycle Manufacturers' Trade Association (who, by the way, is no relation to Mr. Bowden of the Bowden brake) took the chair at the meeting on Wednesday, and was supported by several members of the Committee of the Cycle Association. Amongst those interested in the motor trade present were Mr. Lisle, of the Star Company, Mr. S. F. Edge, Mr. J. J. Mann, of Marshall and Co., Mr. C. Friswell, Mr. J. S. Critchley, director of the Daimler Company, Mr. F. F. Wellington, Mr. Astell, of the New Orleans Co., Mr. Cappellan, of the Sports Motor-car Company, Mr. G. H. Smith, of the United Motor Industries, and Mr. Shippey. The chairman, in his opening remarks, gave a short history of the Cycle Manufacturers' Trade Association, telling how his Association had successfully fought law suits for the trade, and how in numerous cases where litigation threatened they had made arrangements for compromise and licences where they considered the patents good and new.

In this category the Chairman alluded to the patents of the Dunlop Tire Company and the Bowden brake amongst others. The Chairman, in addressing a warm invitation to the motor trade to amalgamate with the Association, stated that the Association was financially strong, having some thousands of pounds to their credit, and offered the motor trade an equal representation on the Board and the Committee. The advantages offered by this amalgamation would include the standardisation of parts, the adoption of the metric system and the holding of the show at the Crystal Palace, which in the opinion of the Chairman is most suited to its purpose. Alluding to the Agricultural Hall, the Chairman said it was suitable for cattle but not for ladies who wished to visit the motor-car show, whilst on the other hand the Crystal Palace was a pleasant place to visit. Mr. J. J. Mann, of Marshall and Company, remarked that the motor trade was already pledged to show only at the Agricultural Hall for the next two years, and that they had already a Protection Association, so that the overtures of the Cycle Manufacturers' Association, came too late. Mr. Mann also doubted whether it was to the interest either of the motor trade or the cycle trade for their Associations to amalgamate, owing to the great dissimilarity in almost every respect of the two trades. Mr. Charles Friswell expressed his opinion against the amalgamation, and did not see what advantages the Cycle Manufacturers' Association had to offer to the motor trade. Mr. Shippey spoke at some length in the same strain. Mr. S. F. Edge advocated joining the Association and holding a show in the profits of which the whole trade would participate instead of taking part in a proprietary one.

The proposal for which the meeting had been convened was made by the Chairman, and after some considerable delay in search of a seconder was seconded by Mr. John Marston. After a somewhat hot discussion Mr. Mann, representing Marshall and Co., proposed the following amendment: "That the Cycle Association continue as it is to represent the cycle industries, and that the Automobile Mutual Protection Association represent the motor industry, and that both associations combine their efforts to promote such interests as are common to the two." Mr. J. S. Critchley, representing the Daimler Company, seconded the amendment, and expressed himself entirely in accordance with Mr. Mann's views. Upon the amendment being put some difference of opinion took place with regard to the counting of the votes, but it was understood that six hands were held up in favour of the amendment, whilst the Chairman had to ask two or three times for the reluctant hands to go up against the amendment. Finally five gentlemen voted against it, four of whom were members of the Committee of the Cycle Manufacturers' Association.

The Chairman expressed his disappointment and implied that the motor trade was not as united, regarding the one show, as some of the members there present believed. He stated that Sir Edward Jenkinson, who had led the one show meeting at the Automobile Club, had himself, as Chairman of the Daimler Company, booked space at another show as far back as April 13th. Mr. Critchley, a director of the Daimler Company, denied the statement. Mr. Peach corroborated the Chairman's statement. Mr. Critchley replied that there was evidently some misunderstanding. A change of directors had taken place about that time, and it was not the intention of the present board to exhibit at any but the one show at the Agricultural Hall. The chairman retorted that such a resolution would lead to litigation and was highly detrimental to the interests of the shareholders. The discussion became personal, and the meeting gradually broke up.

RESISTANCE OF ROAD VEHICLES TO TRACTION.

At the meeting of the Mechanical Science Section of the British Association on Friday last week, Professor Hele-Shaw, F.R.S., read the report of the Committee on resistance of road vehicles to traction. He stated that at the first meeting of the Committee it was decided that an experimental car and dynamometer were necessary for performing the experiments on road traction, that members of the Committee should be invited to state their views in writing concerning the mode in which the experiments should be carried out, and that ultimately, with a view of obtaining results on different types of roads, trials should be conducted at three centres where facilities could be obtained, namely, Aldershot, Cupar-Fife, and Liverpool. At the same meeting, Mr. J. Brown, Belfast, offered to alter the Viagraph, which was a self-recording instrument of his own invention, in order to make it specially suitable for carrying out the experiments, and to place it at the disposal of the Committee. At a subsequent meeting it was decided that, in order to undertake in a thorough and complete way experimental researches, it would be necessary to raise a sum of about £1,000. The Committee felt that in view of the great development of mechanical traction upon roads, the scope of the report should not merely be limited to experiments on tractive resistance, but should deal with the effects of vehicles upon road surfaces of various kinds, and should involve experiments not only with different kinds of tires, but with varying loads and speeds, and with different types of vehicles. An investigation would be gone into concerning the relative effect upon the roads of various forms of mechanical traction and the best types of road for this purpose. They might therefore look with confidence to substantial pecuniary support from makers and users of traction engines and manufacturers of motor-vehicles, and from various county councils and local boards.

Meanwhile, an offer having been received from Sir David Salomons to lend to the Committee, and alter as they pleased for an indefinite period, a motor-car, it was determined to accept the offer and proceed at once with a series of preliminary experiments, which would pave the way for future and more complete investigations. During the past few months work had been steadily proceeding upon the motor-car, the cost of the new engines for which was being defrayed by Sir David Salomons. Although great delays had been experienced with the engines, it was hoped that very shortly a preliminary series of experiments might be commenced. These it was proposed to make, in the first place, with single wheels with different kinds of tires, the track for this purpose being artificial, consisting of different kinds of materials laid in a trough or trench about 18 inches or 2 feet in width, so that the dynamo-meter itself could be tested when the car was running upon a piece of level surface. In this way the autographic records obtained for materials, such as sand, wet and dry, loose stones, artificial projections of cross-pieces of wood of different sizes and differently pitched, could be thoroughly understood, so as to enable the actual road trials to be made without unnecessary delays. The new Viagraph of Mr. Brown had been received, and was awaiting these trials. It had been altered by the important addition of a device for attaching different curved surfaces, representing segments of wheels of different diameters. The rise and fall was autographically recorded, and from experiments made it was clear that the actual contour of the road or surface being experimented upon could be clearly indicated at the same time that the actual resistance was being recorded by the dynamo-meter. The report was unanimously adopted.

FURIOUS DRIVING CASES.

At the Settle Police Court, Thomas Eastham, of Clitheroe, was summoned for driving a motor-car at a speed greater than twelve miles an hour. From the evidence of the prosecution, it appeared that two police officers were stationed near Hellifield, at a distance of a mile apart, on the day in question, for the purpose of timing motor-cars, and that the defendant's machine covered the distance in three minutes, or at the rate of twenty miles an hour. The magistrates inflicted a penalty of £5 and costs.

At Rugby Police Court, Lindley Scott, of Foxborough Hall, Woodbridge, Suffolk, was fined £5 and 10s. 6d. costs for furiously driving a motor-car on the London Road at Stretton-on-Dunsmere. The police evidence was to the effect that defendant was driving at thirty miles an hour.

At Colchester Police Court, George Oliver, was summoned for driving a motor-car at a greater speed than twelve miles an hour on the Harwich Road. The defendant, who pleaded not guilty, was seen by Police-constables Friend and Kerridge driving a motor-car belonging to Messrs. Hyam and Co., along the Harwich Road about 5.30 p.m. on the 3rd inst., at the alleged rate of eighteen miles an hour. In consequence of complaints received, the constables had measured 220 yards, and the defendant covered it in twenty-five seconds. When told to stop, the defendant pulled up in twenty-eight yards. The defendant said just before he saw the constables his car had broken down, and he had to repair it. The car weighed a ton and a half, and was loaded with a ton of goods at the time in question. It was impossible for it to go more than twelve miles an hour. The Bench fined the defendant £1 and 15s. costs, in default of distress, fourteen days.

At Chelmsford, Herbert Frederick Guinness, of Rutland Gate, London, S.W., was summoned for driving his motor-car, between Ingatestone and Chelmsford, at an excessive speed on August 31st. It was proved that the defendant covered the distance at the rate of twenty miles an hour. The usual fine of £5 was imposed, and the costs came to £1 2s. 6d.

HENRY RICHARDSON, of High Road, North Finchley, for driving a motor-car on the highway at Hilgay on the 19th ult. at a greater speed than twelve miles an hour, was fined £5, and costs £2 13s. 1d.

At Chelmsford, on Friday, Herbert Smith, of Piccadilly, London, pleaded guilty to driving a motor-car at an excessive speed. P.C. Flack saw the car going through Springfield, and telephoned from the Police Headquarters to the Shire Hall. P.S. Coppen received the message, and almost immediately saw defendant drive up to the Saracen's Head Hotel. Defendant had travelled 1,540 yards in just two minutes, or at the rate of twenty-six and a-quarter miles per hour. P.S. Coppen said that as it was Sunday dinner-time there were only a few people about. Fined £5 and costs 17s. 2d.

At Kingston-on-Thames County Police-court, Sir Charles Lawes, of The Studio, Chelsea Gardens, was summoned for driving a motor-car at a speed greater than twelve miles an hour on the Portsmouth Road, Esher. Police-constable Pike deposed that on August 29th he saw the defendant passing near Sandown Park Racecourse driving his car at quite eighteen to twenty miles an hour. The defendant said he understood the police-constable was looking for a car similar to his. He had sent his car to the makers to be repaired, and he supposed that because they had tested it on the roads the car had got a bad name. On the present occasion he was riding in the car himself, but he was not in the habit of driving at an excessive speed. A penalty of £3 and costs was imposed.

At the Settle Petty Sessions, John C. Green, cycle agent, Cross Hills, was fined £3 and costs for driving a motor-car at an excessive speed on the highway between Hellifield and Long Preston. Two policemen were stationed on the road near Hellifield, a mile apart, and they declared that defendant traversed the mile in 2½ minutes.

At Godstone, John Wells, of Grosvenor-road, London, was summoned for driving a motor-car at an excessive rate at Godstone on the 25th August. Sergeant Southcott said he was on duty at the bottom of the Godstone Hill on the day named, when he saw defendant travelling at the rate of twenty-four miles an hour. He went 176 yards in fifteen seconds. A fine of £3 and costs, amounting to 10s. 6d., was imposed.

At Oxted Police Court, Morgan Donne, of Clerkenwell, was charged with driving a motor-car at a greater speed than twelve miles per hour. Inspector Pullen said that about 4.30 p.m. on the 18th August he was on duty in plain clothes near the Warringham station on the Godstone-road, when he saw the defendant driving a motor-car at an excessive speed. The witness timed him over a distance of 176 yards, which he covered in 22 seconds, which worked out at the rate of about sixteen miles per hour. The defendant said that when he went down the road he saw the inspector run out from the side of the pathway. He (defendant) had since investigated the spot, and it was impossible to see up the road from a position in which he first saw the inspector. As he had his wife and children with him it would be impossible for him to have been riding at the speed stated, and he wished to point out to the Bench that an error the inspector might have made over a short distance like that would multiply the speed considerably. After a short deliberation with his colleagues the chairman said the defendant was liable to a penalty of £10, and he would be fined £3, and 10s. costs.

At Oxted Police Court, Lionel Savory, of Broadhurst Gardens, West Hampstead, was charged with driving a motor-car at a greater speed than twelve miles an hour. Sergeant Southcott said that on Sunday, the 18th August, he was on duty near the Wapses' Lodge, where he saw the defendant driving his motor-car at a great speed. He went over a distance of 176 yards in fifteen seconds, or at a rate of twenty miles an hour. The defendant called as a witness a young gentleman who was on the car with him at the time. The witness said they left Godstone on the day named at 5.25, and it was five minutes to six when they were stopped by the police. The defendant was fined £3, and 10s. 6d. costs.

At Oxted Police Court, Percy Seal, of Enfield Wash, Enfield, was summoned for driving a motor-car at a greater speed than twelve miles an hour on August 18th. Mr. Seal did not attend the court. P.Sergt. Southcott said defendant was travelling at the rate of twenty miles an hour. The defendant was fined £4 and costs, the Chairman remarking that the distinction was made between him and others answering similar summonses that day, because Mr. Seal had not put in an appearance at the Court. In his opinion the highways were for the use of all and the danger of none, and when a person was summoned and did not appear there must be a distinction made between him and those who did.

At Swansea, David G. Thomas and Alfred E. Gash were summoned for driving a motor-tandem furiously on August 24th. Mr. Dormer Andrews defended. The chief witness was Mr. R. T. Leyson, solicitor, who said that the defendants drove the machine down the hill towards Swansea at a very rapid pace, and the car twisted and ran into the hedge, striking a girl and precipitating the occupants out. The car was going at thirteen to fifteen miles an hour. The defendants, in excuse, stated that it was the fault of the car that they came to grief, and they were only going six to eight miles an hour. They called other evidence, and the Bench thought that a fine of 10s. and costs on the driver would meet the case.

At Doncaster, Mestrad Amedee, a French machinist, in the service of Captain Laycock, Doncaster, was charged with furiously driving a light locomotive, on the 15th August last. Four witnesses who saw him pass through Doncaster gave the speed he was driving at from thirteen to twenty miles an hour. The chief constable, one of the witnesses, fixed the speed at fifteen miles. The defence was that the car had been so geared that it could not travel at more than seven or at most eight miles an hour. The Bench held the case proved, and fined the defendant £5 and costs.

On Saturday, September 14th, William J. Peall was summoned at Reigate for driving a motor-car near Red Hill at a greater speed than twelve miles per hour. The police sergeant deposed that on Saturday, August 17th, he timed defendant as having driven his car 176 yards in 18 sec., which worked out at twenty miles per hour. Under cross-examination he admitted that a mistake had been made in the measurements, and the distance was only 158 yards, which reduced the pace, and he also stated that to time the car he was standing behind a hedge some 25 yards from the end of the 158 yards, and took the start when the car was passing the brow of the hill some 200 yards away, and the finish opposite a gate. He admitted the gate was fully 10 feet wide, and was very uncertain as to what part of the gate he timed the car to, also his watch was not a stop watch. When asked if he had anyone to corroborate his evidence, another constable was called who stated that what first witness had said was correct, but on being cross-examined admitted that he was hiding in a field some yards further on, and could not see the car coming at all. The first witness was then recalled, and asked by Mr. Peall if he did not say to him at the time that the car was going slowly

when it passed him, which he admitted; and stated that the car was slowed up before reaching the end of the distance, and he had taken off the few yards and worked the pace out from that. Mr. Peall, who then elected to give evidence on oath, stated that he would not swear on oath that the pace was eleven, eleven and three-quarters, or thirteen miles per hour, but stated that he was driving very quietly, and had no idea he was breaking the law. He maintained that the sergeant could not check the times with an ordinary watch, and also that he was very indefinite as to where the measurement ended. As for the second constable's evidence, he might have been 100 miles away for all he knew. The defendant stated he had witnesses to prove his defence, but without giving him time to call them, the Bench imposed a fine of £2 and costs.

At Walsall Police Court, Charles Mason was summoned for furiously driving a motor-cycle on August 30th. Mr. H. H. Jackson defended. Police-constable Jones said that at 7.45 p.m. on Friday, August 30th, he saw the defendant drive a motor across the Bridge at a rate of about fifteen miles an hour. Mr. Jackson pointed out that the defendant's motor had been geared down recently so that its speed could not exceed twelve miles an hour, and on the day in question it was not driven at any time at more than six miles an hour. The case was dismissed.

THE AUTOMOBILE MANUFACTURING COMPANY.

IN the Vacation Court, last week, before Mr. Justice Joyce, Mr. Peck moved ex parte on behalf of the plaintiffs, in the case of the Automobile Manufacturing Company v. Jordan and Rogers, for an injunction in the terms of the writ restraining the defendant Rogers from advertising the acquisition by him of the business and premises of the plaintiff company, and his intention to carry on the business. The learned counsel read the affidavit of a director of the plaintiff company, which, it appeared, was incorporated in April, 1900. Subsequently a mortgage was effected for £500 with the defendant, Albert Arthur Jordan, to be a charge on the undertaking, and it was agreed that during the continuance of the security Jordan was to receive all moneys payable to the company, and that he should be at liberty to carry on the business subject to the keeping of proper and sufficient accounts, and if there was any balance in hand on August 20th, 1901, it was to be applied in part payment of the mortgage debt. In spite of that, the defendant Jordan had sold the business and premises.

His Lordship: Sold to whom? Mr. Peck: To the other defendant. His Lordship: Where is the money you undertook to pay him? Mr. Peck: We are prepared to pay it into court—£502 principal and interest up to last Monday. His Lordship: Very well; on your undertaking in damages and paying £502 2s. into court to plaintiffs' suspense account I will give you an ex parte injunction to Wednesday the 18th inst. in terms of the writ. Subsequently his Lordship also granted an injunction to restrain the defendant Jordan from selling or disposing of any of the stock in-trade of the company at 48 and 49, Long Acre, which was not included in the mortgage. Subsequently Mr. Peck said he had been wrongly informed that the defendant Jordan had sold all the effects of the company, and he asked that the injunction might be extended against Jordan for selling or disposing of the stock in-trade and effects of the plaintiffs at 48 and 49, Long Acre. His Lordship granted the application.

The motion came on for further hearing on Wednesday.

Mr. Bramwell Davis, K.C., for the plaintiff company, said he had only just received an affidavit by one of the defendants, and he had no opportunity of reading it. As the case was a curious one he thought it should stand over. Mr. Ford said he appeared for one of the defendants, and did not object.

His Lordship said he thought that the affidavit should be answered, as otherwise, as he understood it, it looked as if Mr. Jordan, who was an employee, had a right to sell. Mr. Bramwell Davis said that the stock was valued at £3,000, and one of these gentlemen had bought it for £150. As a matter of fact, he might want to cross-examine Mr. Rogers. The difficulty was this, that the business was being carried on by a nominee of Mr. Rogers. His Lordship said he did not understand by what authority Mr. Jordan had sold the business. Mr. Bramwell Davis said it was sold under a charge the terms of which were that the money should be paid within a month. There was a provision that the terms of the Conveyancing Act should not apply. His Lordship: Is the tender disputed? Mr. Ford: The tender is disputed. My client actually assigned the property before the action, and therefore the motion seeking to restrain me is out of order, and I claim the right to what has been done. His Lordship thought the motion could not go on that day, and he extended the injunction for a week, at the end of which time the case should be before the court.

NO LIGHT.

At the Bromley Petty Sessions, Robert Bell was summoned for neglecting to carry a proper light upon a motor-car driven by him on the night of August 30th, at South Eden Bark, Beckenham. Defendant pleaded guilty. Police-sergeant 21 P stated that when stopped defendant said he did not know the lamp had gone out, and that it was alight when he left the West Wickham Hotel. There was a small bicycle lamp on the car, but not a proper light. A fine of 20s. and 9s. costs was inflicted.

NEW GRAPPLER COMPANY V. MOTOR MANUFACTURING COMPANY.

IN the Vacation Court, Mr. E. A. Collins applied on behalf of the plaintiff company for an order to issue and serve a writ out of the jurisdiction. Counsel moved on the application of Mr. H. W. Mullen, in which it was stated that the plaintiffs were desirous of commencing an action against the defendants, whose registered offices are at 47, Holborn Viaduct, London. The plaintiffs claimed £253 for damages alleged to have been sustained by plaintiff by reason of certain breaches of contract. Mr. Justice Barton granted the order.

EMITTING STEAM.

At Caterham, Charles Padden, of Lower Edmonton, was summoned for blowing off steam from a motor-car at Caterham on the 25th August. The defendant pleaded guilty. P.C. Stevens said he saw the defendant driving his motor car through the Valley at 11 a.m. on the 24th August, and noticing steam issuing from the rear of the car he called upon the defendant to stop. Witness told him he was allowing steam to escape instead of turning it into the condenser and he said he had no condenser attached but that he would have one fixed. The Chairman (to the constable): You use the word steam; do you mean to imply by that that it is a motor driven by steam or by petroleum? Witness: I do not know. The defendant was fined £2 and costs.

At Dorking, Henry Adere was summoned for having blown off steam from his motor-car in High Street, Dorking, on August 29th. P.C. Dodman proved the case, and said when he stopped defendant he informed him he had burst a pipe and wanted to know where he could get it repaired. Witness showed him, but defendant made no attempt to stop, but let off steam through the High Street. Fined £1.

It is rumoured that a prominent motor firm on the Holborn-viaduct is about to vacate its premises.

A MOVEMENT is on foot in Brussels to organise an automobile race from that city to Paris next spring.

MR. WILLIAM BULMER, of Windsor, Ontario, has just completed a steam car, said to be the first of the kind built in Canada.

WITH reference to the paragraph in our last issue regarding boats fitted with De Dion motors, Messrs. Friswell, Limited, write us stating that they have been fitting De Dion motors to boats since the early part of this year, and that they are on view at 48, Holborn-viaduct, or at Mr. Cleaver's depôt, Eel Pie Island. They have them ready for immediate delivery, or to order for delivery early in the spring.

THE *Motor World* of New York is the authority for the statement that in a test which was made in Chicago recently, a record run was made by an electric vehicle without recharging the batteries. The distance covered from 5.43 p.m., Monday, when the run started, until the carriage stopped, was 187½ miles. The carriage was a Baker, made by the Baker Motor Vehicle Company, of Cleveland, owned by Mr. F. C. Phillips, of the same city, and was driven by him throughout the long run. The carriage was equipped with a battery which is the invention of Mr. H. C. Porter, of Chicago. Mr. Phillips is confident of his ability to break his own record and expects to be able to set the mark at 200 miles in his next attempt.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, SEPTEMBER 28, 1901.

[No. 134.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE Manchester Automobile Club, although only some eighteen months old, has now close upon 100 members. During this season several most successful runs have been taken. On Saturday last Alderley Edge was visited. No procession of cars was arranged, the members starting at any hour they thought fit in view of the programme and the time they were expected to arrive. By the invitation of the Chairman of the Committee, Mr. W. E. Rowcliffe, the members and their friends were entertained to tea on arrival. The honorary secretary, Mr. J. Hoyle Smith, on a 12 h.p. Belsize car, carrying four passengers, was the first to climb the hill leading to the house, and was closely followed by the 6 h.p. Daimler car belonging to Mr. Baron. After these two cars had taken up their position on the circular drive in front of the house three De Dion voiturettes arrived, belonging respectively to Mr. W. E. Jones, Mr. F. Gresham, and Mr. Dyson. A little later Mr. Higginbottom's 34 h.p. motor-car arrived and created a sensation, being the largest car possessed by any member of the Club. It was out for the first time and is credited with a speed of sixty miles an hour. This, however, was not put to the test. The remaining cars were a 9 h.p. Napier, driven by Mr. Lewis, of Bowdon; an Empress voiturette, which brought Mr. and Mrs. Higginson; a Century tandem, driven by Mr. Whittaker; and a Sirene voiturette, belonging to Mr. Emery. The cars started by moonlight on their homeward journey, about eight o'clock. It is intended to hold the annual dinner of the Club on the 14th November.

The New Game.

FINING motorists is a profitable game for local authorities. It is played with the help of police, who can exaggerate greatly and imagine much, to say nothing of the prejudice and ignorance of country magistrates. With such a combination some of the county authorities should be able to obtain enough funds from prosecuted and persecuted motorists to maintain open spaces for small towns or to pay the expenses of horse keep for the mounted police. At first motorists joined in the game, and by appearing in the police-courts constituted a third party, but now the new magisterial pastime is being played with only two sides—the police who imagine vain things, and the local authority that pockets the amounts named by the magistrates.

The Grantham Cases.

THAT the foregoing statement is no travesty of the situation was apparent at Grantham on Saturday. Lincolnshire has an unenviable notoriety among motorists, and hence the absence of three defendants summoned for rapid motoring at the Grantham Court. The trio were summoned, but they could easily anticipate the result. So instead of wasting money in making a defence they awaited the decision of the wiseacres who are appointed to administer "justice." Later came notification that each had been fined £10, so that the county is

£30 to the good—thanks to the enthusiasm of the police, whose word is always accepted by magistrates (when motorists are concerned), and who manage to escape the charge of perjury in a wonderful and remarkable way unknown to ordinary mortals.

No Justice Obtainable.

OF course, this condition of affairs has a humorous aspect, and would have been welcome in the days of Gilbert and Sullivan comic opera. But such jokes are expensive, and, moreover, there is a serious aspect to the affair. Things have come to a pretty fine pass when English gentlemen decline to plead in English courts because they believe that their cases have been prejudged, and retaining solicitors is only adding to expense that cannot be avoided. Surely the Home Secretary should be watchful of the interests of the public and issue some admonition. To day it is the motorist who is regarded with such opposition; but it may be some other section of the public later; for prejudice, baulked in one direction, generally finds victims in another. Hence our hope that action may be taken by the Home Secretary in the interests of the community.

A Needful Alteration.

THE present position having become so unsatisfactory, is it not time that the authorities recognised the need for reviving that clause of one of the old Highway Acts which made it an offence to drive to the public danger? There are occasions when a speed of five or six miles an hour in a crowded place would constitute a menace to the lives of the people; there are other times when a speed of four times that pace could be safely attained. To have one hard-and-fast rule for all districts and all times is absurd; common sense should have free play, and prosecution only be instituted where motorists were vicious enough to endanger life. Such a case could easily be proved. At present the difference between eleven and thirteen miles an hour is sufficient to bring a motorist within the area of legal jurisdiction. But if the suggestion as to driving to the common danger were enforced, no ambiguity could ever obtain, and scorching motorists would not escape detection.

No Speed Limit.

THIS subject of raising the speed limit has been much discussed in the motor world, and the question as to the number of miles per hour allowed to be travelled has been the cause of long arguments. To our mind the matter is of easy solution. There should be no speed limit whatever; the old Highways Act, whereby a driver is liable to pains and penalties, being quite sufficient to prevent reckless driving. If, however, the speed limit was raised to twenty miles per hour, each of the three gentlemen summoned to appear at Grantham on Saturday last would still have been fined the maximum amount. In our case the policeman swore they timed us between two milestones, and found we travelled at the rate of thirty miles an hour. Our car is only geared to twenty-four miles, and being a new one does not travel as well as it will probably do later on. The speed we were travelling was under twenty miles an hour, and that speed we do not think we ever exceeded in our 1,800 miles tour to Scotland and back.

Tire and Other Troubles.

We had had trouble all the day on which we were said to be driving furiously. The petrol pipe broke twice, another pipe also burst, and we had innumerable punctures. Warning was also afforded us by a policeman on crossing the borders of Yorkshire into Lincolnshire by the gentleman officiously taking out a watch, looking at us, then at the watch, and afterwards putting it into his pocket. We proceeded unmolested into Newark, where we had to stop to take in petrol at a chemist's shop adjoining the police-station in the Market Square. Two policemen stood outside and watched with evident interest our methods of procedure. The distance between Newark and Grantham is less than eight miles, and at the latter place we had arranged to stay the night. We travelled about five miles without anything happening, when two cyclists, moving in our direction, waved their hands. This was in a long wide village, through which we, as is our wont, were travelling slowly. There were four of us on the car, and we all noticed the waving of the hands—but it was not a signal to stop, and when we looked round no further notice was taken. A carrier's cart was coming along, and we took the waving as a warning that there was something in front. We went on, and then a tire punctured. This was repaired—and then puncture again. A cyclist, a young Cambridge student, stayed and helped us, and finding, as it was dark, we could not repair the puncture, he kindly rode into Grantham, ordered a conveyance for the ladies, and a tire repairer to proceed to the disabled car. With the carriage the cyclist sent back a card, with the words, "Just outside Grantham two policemen stopped me and asked information of you. Sorry I was obliged to tell.—J. S. S."

TRUFFAULT'S 12 H.P. VOITURETTE.
The Winner of the Mile Contest (Voiturette Class) at Deauville.

Grantham and Afterwards.

IN the meantime a cyclist rode out and stated he was a sergeant of police, desired our names and addresses, and said we had been timed between three milestones, and had been found travelling at the rate of about twenty-four miles an hour. We put up at the Angel Inn, and at eight o'clock next morning a constable was found stationed outside the hotel; a sergeant called at 9.15; and after having ascertained from the landlord of the inn that we had given our correct names, desired us to accompany him to the police-station to see the superintendent. This we did, although for what purpose we are unaware. The superintendent then spoke fairly, but later on acted the reverse, as the result of the proceedings will show.

Punctures and Police.

AFTER our interview, having all through adopted an attitude of *suaviter in modo*, we proceeded on our way, but had not gone four miles before we began again suffering from punctures, but ultimately reached Colsterworth, where we were forced to halt, an outer cover having burst. Perhaps this was

fortunate, as we afterwards heard there was a policeman stationed at each end of the village, and a sergeant in the middle, on the look-out for us. We have taken legal advice, and the matter is now in the hands of our advisers, with a view to the facts in our case being laid before the Treasury.

Resistance of Road Vehicles to Traction.

AT a meeting of the General Committee of the British Association last week the Committee appointed to investigate the resistance of roads to motor traction asked leave to have the Association grant supplemented by outside subscriptions, as their inquiry would probably prove expensive. The President said the Association rules provided that no Committee should raise money in the name of, or under the auspices of, the British Association without permission, and that no money so raised should be expended except in accordance with the rules of the Association. It was therefore apparently contemplated that leave might be given to a Committee to raise money otherwise than through the Association, and he thought there was much to be said in favour of the present case. Sir Fredk. Bramwell said it was important to investigate the resistance of roads under various circumstances and conditions to traction, as well as with reference to the types employed and the weight carried. There was reason to expect a large increase in motor traffic of all kinds, both goods and passengers, upon roads. The proposed Committee would be presided over by Colonel Crompton, who was now engaged by the Government in devising proper machinery and arrangements for the development of that motive power for war purposes. He moved that the Committee on the resistance of road vehicles to traction be authorised to obtain outside subscriptions in aid of their work. This was unanimously agreed to.

Progress in Essex.

AT Braintree, on Sunday, reports one of our roving contributors, I saw evidence of the popularity of the Essex high roads among automobilists, for in a space of about an hour half a dozen motor-vehicles passed through the town. The people about that part have had practical evidence of the value of the automobile in heavy traction. Messrs. Courtauld have several crape and silk mills in the neighbourhood of Braintree, and are employing a steam motor-van to convey materials to and fro, and in a town a few miles distant a leading firm of flour millers have adopted a similar method of transport. In this country the commercial aspect of automobilism is being developed alongside the touring or pleasure side of the movement; and therein is ample assurance for the prosperous future of our industry.

A Note from Aberdeen.

AMONG provincial leader writers the gentleman who is connected with the *Aberdeen Press* displays the most rational attitude with regard to automobilism that we have noticed north of the Tweed. Recognising that the motor-car is coming into universal use, he writes, "Instead of crying out against the use of the motor-car as objectionable, attention should be directed to the checking of any abuse that may arise. But, as in the case of the bicycle, it may be expected that the more extensive the use of, and the greater the familiarity of the people with, the motor-car, the more effectively will be removed the objections and prejudices with which it is in the meantime regarded." This being so, why seek to thwart the initial stages of an industry which will loom large in British trade returns in the near future? All the talk about taxing, numbering, and restricting motor-cars is calculated only to dishearten manufacturers who are hopeful, if common sense prevails, of developing a new industry in an old country that seems to require such a filip—judging from the lugubrious utterances of some of our public men with regard to foreign competition.

Nottingham Automobile Club.

To judge from the excellent turn out of this Club on Thursday, the 19th inst., in response to an invitation from Mr. R. M. Millington Knowles to visit him at Colston Bassett Hall, automobilism should be in a good way in the lace county. Twenty motor-vehicles conveyed fifty members of the Club to the genial president's pleasant country seat. A start was made at 2.30 from Nottingham, and over excellent roads, favoured with ideal weather, the party soon arrived, without incident, at the hospitable Hall. There Mr. and Miss Knowles received their guests, and conducted them through the trim and admirably-kept grounds, after which an informal tea was served in the house. Mr. E. W. Wells (vice-president of the Club) proposed a vote of thanks to Mr. and Miss Knowles for their hospitality, and briefly spoke of the pride they felt in having Mr. Knowles for their president. The return journey was made in excellent time, and under the same favourable conditions as had marked the outward run.

Motor-Tutors.

MOTOR-TUTORS are coming into prominence, and our advertisement columns have already testified to their presence in the land. There are hundreds of people who will want to drive their own cars—even if they do not care to practise the delightful operation of cleaning them—and hence there should be a good demand for the services of reliable drivers willing to teach. The question of terms will, of course, have to be considered, and, so far as observation goes at present, the idea of charging by the hour is a very good one. For the capacity of owners to

if nothing else succeeds. Horse-owners who are agitating for the offensive numbering of motor-vehicles could not complain if motorists started a counter movement in this direction.

Motor-Cars v. Trams.

QUITE a flutter has been caused in the dovecotes of the electrical tramway engineers by Colonel Crompton's championship of electric motor-omnibuses at the British Association. All around London schemes for electric trams are being promoted, and in many suburbs tramlines are destroying the highways and leading thoroughfares. The adoption of motor-omnibuses would enable people to be more promptly conveyed from one point of the City to another and without the excessive cost of interfering with existing road surfaces. The statement of Colonel Crompton that 14,000 people can be carried past any given point in one hour by omnibus has been challenged by Mr. Clifton Robinson, but the figures must still be regarded as reliable, for they were supplied by the London General Omnibus Company, who had a record taken on the Piccadilly-Hammersmith route after a Lord Mayor's show. There is plenty of profit for the promoters of a really satisfactory line of motor-omnibuses in and around the Metropolis.

Fascinating Sport.

MR. T. R. DEWAR, M.P., attempts in the *Week End* to answer the question, "Which is the most fascinating sport?" and, after dilating upon the attractiveness of golf, shooting, angling, horse-racing, and road coaching, declares that "motor-driving is a most fascinating amusement and, withal, a most useful

Jenatzy's 100 h.p. Combination Petrol-Electrical Car.

M. Serpollet Starting for the Mile Record.

THE DEAUVILLE RACE MEETING.

[Cliches de]

[La France Automobile.]

learn to drive will be as various as the tempers of horses called upon to meet the automobile on their daily rounds.

Dealing with Horses.

It was bound to come! Recognising that the automobile is not to be frightened off the road in a hurry, and having regard to the folly of those who decline to have their horses educated to decent behaviour when in the presence of motor-cars, several inventors are said to be at work on devices to deal with horses when shying. In Russia a choke-rein has been in use for many years, and a neat apparatus which brings the horse to a standstill by a comparatively light pressure on the windpipe is now in use in New York. In France more complicated arrangements are coming into vogue to deal with fractious animals. One device which has been adopted is to fix an extra pair of blinkers on the ordinary blinkers. These are provided with a spring by means of which they can be brought completely over the eyes of the horse when he becomes restive. We regret that some owners should not be willing to use moral suasion with their animals; but the use of such devices will have to be rendered compulsory

method of overcoming the obstacles of space and distance, and to those who have not tried it I would say, in the words of Dr. Johnson, 'Then you have an immense pleasure to come.' Having thus indicated his preference, the worthy M.P. gives his opinion that the great majority of people derive more pleasure from bicycling than from any other national pastime. The bicycle is within the means of millions; with thousands of people, however, the motor-car is just as popular.

Penalty of Publicity.

So much public interest has been aroused by the announcement of a motor-car service between Piccadilly Circus and Putney that private cars passing over the chosen route are constantly hailed by would-be "two-pennyworths." Mr. Guy Lewin of the New York Tire Company, tells us that one day recently, whilst riding a friend's car in Piccadilly, he was violently dug in the ribs by an umbrella, at the other end of which was an old lady who demanded conveyance to Putney. On explaining that he was not licensed to ply for hire, and moving on, the old lady gesticulated violently with the

umbrella and exhibited those well-known signs of despair so frequently seen on the London pavement as the long-awaited 'bus rolls heedlessly by.

An Object-Lesson.

THE appalling wagonette accident reported from Yarmouth, in which the whole of the passengers thrown on the road by the overturning of one vehicle were run over by another, with fatal results to two and injuries more or less serious to ten, is one that should set the wholesale denouncer of the motor-car thinking. Had the vehicle following the cap-sized wagonette been a motor-car the short space in which it could have been brought to a standstill would have rendered the running over, as a finish to the already serious disaster, impossible. It is not many months since Epsom was, on one of the race days, the scene of an equally disastrous wagonette accident, and hardly a week of the summer has passed unmarked by similar calamities to parties of pleasure-seekers. That the majority of these, and many similar accidents of a minor nature, would never have occurred had motor-cars been the vehicles employed is well enough known to the automobilist, but to convince the general public of this will be the work of years. Meanwhile the horse will continue to claim his victims by the hundred without a word of protest, for 'tis an old, old story that every one is used to. It is only on the very rare occasion of a motor-car figuring as the offending vehicle that anything of the nature of a protest is raised.

Motorists in the Air.

THE Hon. C. S. Rolls and his balloon party, consisting of Mr. Frank Butler, Miss Butler, and Mr. Stanley Spencer, decided to take advantage of the fine weather, and made their projected ascent in the new aerostat City of York on Tuesday afternoon from the Crystal Palace grounds. Mr. Rolls and Mr. Butler drove down to the Palace in their motor-cars and superintended the preparations for the ascent. Eventually the balloon was released, and was wafted by a very gentle breeze in a north-westerly direction. The stillness of the air afforded the aeronauts ample opportunity for making the desired photographic experiments at various altitudes, and we understand that some interesting results have been obtained. After an altitude of some 2,000 ft. had been reached, a curious counter current was met with, which caused the aerostat to drift back for some time towards the point of departure. Some little difficulty was expected in finding a suitable spot for a descent, but *terra firma* was reached just before dark at Lee Green, near Eltham, with the aid of a large crowd of willing helpers on the end of the guide rope. The party intend continuing their experiments shortly with a stronger and more suitable wind. On another page we reproduce a number of interesting photographs taken on the occasion of the ascent.

Jumping to Conclusions.

BECAUSE a man is found dead by the roadside, and there happens to be a lack of evidence as to the cause of death, the Hockley Heath police favour the theory that the unfortunate man is the victim of a motor-car. Even supposing the deceased to bear marks of having been run over, which does not appear to be the case, why should a motor-car be selected as the death-dealing vehicle? Surely the lumbering wagon, with sleepy driver, or brake, full of noisy beanfeasters, are the more likely agents of such a deed done in the dark. The idle hand and tongue of every policeman in the land have been set against the motorist, and it would seem that in future he and his car are likely to be dragged into every crime, shrouded of course with an appropriate cloak of mystery, which baffles the meagre intelligence of the force.

A New Use for Motor-Cars.

DR. DAWSON TURNER, M.D., Vice-president of the Scottish Automobile Club, writes:—"I should like to point out the great future the automobile may have before it in effectually administering the open-air treatment to consumptive patients. I have been very much struck by the beneficial effects produced by a thirty to fifty miles motor-car drive. Along with a feeling of marked exhilaration, an increased appetite, and improved sleep, there is a heightened healthy glow which after a few days' treatment tends to become permanent. The tendency to cough is much diminished. May I suggest to those in charge of sanatoria the advisability of combining a daily run on a good motor-car at a pace fully up to the legal limit with the ordinary open-air treatment? The patients should be placed in front of the car, so as to avoid any dust thrown up by the wheels."

Beware of the Police.

A CORRESPONDENT informs us that there has been recently fitted between Esher and Cobham, in Surrey, a telephone, and that when a motor-car passes either place, due notification is forwarded to the other, with the time of the cars passing. At Cobham, it is stated, a large wagon is kept in readiness, and on hearing from their friends at Esher, the police have this wagon brought out and placed across the road, so that it is impossible for the motorist to pass! We are afraid there are either too many police employed, or else their energies are misapplied. At all events the Home Secretary has need to see into the matter.

Motor-Cars in the Straits Settlements.

MOTOR-CARS have been recommended in this country as a means of relieving the congestion of towns; in some parts of the world they are welcomed as useful in opening up sparsely populated districts. Thus all the world sing their praises, and will soon join in promoting their progress. MM. Delacroix and Kesterre have been demonstrating the speed and reliability of the automobile to the people of the Straits Settlements, and a Singapore correspondent points out that it would be a saving of time and money to the Government officials if a regular automobile service could be established between leading stations, or the officials were provided with cars. We have constructed some excellent roads in the great peninsula, but many of the districts are too poor to support light railways. In some circumstances the motor-car would play an important and an economical part in developing the country.

American Bubbles Burst.

ONE very satisfactory piece of news comes from the United States with regard to the automobile industry. Many of the concerns that were floated two or three years ago to ostensibly deal in automobiles have vanished, as was predicted when they were boomed by certain journals. At the beginning of the modern industry several American financiers took advantage of public interest in the new business to avail themselves of the public capital as well. They started companies which did not intend to make motor-cars but simply to sell shares. A boom was made and this lasted for a little while. Now, however, only a few such concerns remain—a circumstance which is of advantage to the legitimate industry.

AN interesting feature of the High School Sports at Balls Bridge, Dublin, the other Saturday, was the appearance on the track of four Werner motor-bicycles.

MR. H. GAMBLE, of Belper, who has been appointed Northern representative for Messrs. Shakespeare, Kirkland, and Frost, Limited, Bradford Street, Birmingham, informs us that his firm will shortly place on the market a motor-cycle on the Minerva system.

A NIGHT OUT.

A DAY spent in Coventry is always a red-letter one, in my opinion. I love the Motor-car Works and noting the gradual strides made by British manufacturers. It has lately been my lot to ride a good deal on a 12 h.p. Panhard. Its running qualities were magnificent, but its wearing ones made me place greater confidence than ever in native workmanship. What was the use of romping up hills on the third speed, when the steering gear broke, and Providence alone ordained the disaster should occur on a level, rather than on a downhill road? Clutches, too, should be made to fulfil their office, and not give endless trouble through constant slipping. Brakes reliable enough, may be, on a car of four or six horse power, are absolutely untrustworthy on a high-powered vehicle, driven over some of the worst roads in the North of Scotland. Scarce a day passed without those on the fleet Panhard smashing up. Such cars are a luxury only for the wealthy, who can afford to run them for a year, and then invest in the latest novelty. But the sober British public, not endowed with the purse of Fortunatus, require a thoroughly sound, reliable car, strong of build, and economical both in the running and upkeep. In short, they want a vehicle that will last. To them I say, go to Coventry, to Birmingham, Wolverhampton, and any centre of the motor-car industry, and let them see with their own eyes the sound, good, honest work now being put into British cars.

A morning of radiant sunshine, an autumnal crispness in the air, faintly yellowing leaves, and perfect roads, all tended to a drive of pleasure. Little "Forrard On," a Progress voiturette, with a genuine $4\frac{1}{2}$ De Dion engine, bustled along in right merry style. Thirty-one miles were left behind in an hour and thirty-five minutes, barely a gallon of petrol being consumed. The marvellous little engine hissed and sputtered, and performed prodigies of valour on the top speed, climbing ascents which inspired respect even after one's recent experiences of the Panhard. After all, the poor motorist need not envy his richer neighbour so very much. The 12 h.p. Panhard, with all fittings and extras, will cost him close on a thousand pounds, require a skilled engineer to keep it in running order, and imbibe vast quantities of petrol. Forty miles in an hour and a half, over a give-and-take road, is excellent going. But consider the expense—the tires, the repairs, the spare parts and renewals! As I said before, it is a rich man's car. But the modest little four and a half will carry the less ambitious motorist thirty miles in the same space of time and at an infinitely smaller cost. So let him take comfort and be content with his good little conveyance.

"Forrard On" soon landed us at our destination, eluding the blue-coated officers of the law. We took her to the Progress Works, in Coventry, as the gear-case had sprung a slight leak, through which the lubricating oil drained away. "A stitch in time saves nine" is a true housewifely proverb, but never is it more applicable than to motor-cars. We looked forward to an hour or two's stay, and spent a most agreeable morning in inspecting the new types of cars in preparation for the coming year. It was a great disappointment both to the firm and the public, that the new gear-driven car was unable to make its appearance at the recent Glasgow trials, but Mr. West is a man who will not allow anything to be placed on the market before he is himself thoroughly satisfied. Two standard types are in preparation. The first is a light car to weigh about 6 cwt., fitted with either a $4\frac{1}{2}$ h.p. or the new $6\frac{1}{2}$ h.p. De Dion motor, located in front under a bonnet. Special attention is being given to the construction of the frame, which, although light, will be exceedingly strong. The axles are magnificent, and also the bearings. The car will be fitted with two speeds and reverse, and also with a new brake of unusual power, which holds both ways. There will be a third seat, detachable at will, and altogether it should meet the public demand for a fast, light vehicle at a moderate price. The second type will consist of a two-cylinder engine of eight horse-power, with a very ingenious clutch, warranted not to slip, and possessing the further advantage of thrust blocks. A

new form of tonneau body is being fitted, enabling the riders to sit in comfort, instead of with cramped limbs, as is the case in so many of the smaller cars. There are many points of interest about the vehicle which it would be premature to divulge, but good workmanship and high finish are conspicuous throughout. For a young firm the Progress Company have already achieved remarkable success, and, under Mr. West's able guidance, it is destined to gain fame, and we trust fortune.

We looked forward to driving our little car home again the same day, but the afternoon wore on, and it soon became evident that the setting and adjustment of the gear-case was no easy matter. Five o'clock passed, then six. So far, we had revelled in the lights of motoring, but now the shades descended. Suddenly, without warning, down came the rain with torrential fierceness. Dark grew the sky and wild the night. In ten minutes the streets were running rivulets. Worse than all, the car was not ready, and we were advised that we had better defer our departure until morning. We rebelled against the advice, but finally were forced to accept it. Telegrams were dispatched to the anxious better half at home, and we trudged to the King's Head in a depressed mood. My luggage consisted of a sixpenny comb, a threepenny tooth brush, and two twopenny sponges, bought *en route*. Would I be received, so lightly equipped? A damp, solitary female, clad in dripping waterproofs and hugging a paper parcel—her only personal effects? Human nature is kind—say what one likes to the contrary. The visitor was warmly welcomed, and made completely happy by the loan of a *costume de nuit*. Mr. and Mrs. Stanton were found in residence during the completion of that gentleman's fine new Daimler; and later on Mr. McLeod dropped in. We were now a party of motorists, and the subject of our conversation can be guessed. Cars, cars, cars! We could not get away from the fascinating topic. Mr. McLeod wittily suggested that the modern titles of our English hostels were singularly out of place. Why not "The Acorn and the Accumulators," "The Bear and the Bearing," "The Cat and the Carburettor," "The Lion and the Liner," "The Maid and the Male Clutch," "The Racehorse and the Radiator," "The Phoenix and the Pump"? and so on *ad infinitum*.

Rain descended heavily on the following morning, but, feeling very dissipated after our night out, duty compelled an early return to home and hearth. The faithful Brooks had sought a lodging with a fellow mechanic, and soon we scuttled out of the moist streets and said good-bye to the trappy tram-lines. "Forrard On" was in the best of humours, and the dirt seemed to make no difference to the going of the little car. Experts may object to a fast-running engine, but, say what they like, the De Dion is a marvel. For its size, it is uncommonly hard to beat. We look forward to another visit to Coventry ere long, when we are promised a ride on one of the new Progress test cars.

Is there going to be a boom in motor-bicycles? Many of the best-known firms are busy making them, not only for men, but also for ladies. These latter will shortly be placed on the market. One word of advice to the fair sex. Trust rather the machines emanating from houses already in the motor trade rather than those produced by cycle manufactories alone. The latter buy a Minerva, or any suitable engine, pop it on anywhere according to their fancy, strengthen forks and frame at their own sweet will, but have yet to gain experience in the article offered to the public. So, ladies, beware how you purchase, and, before doing so, make a point of having a good trial.

M. E. KENNARD.

THAT the Electric Ignition Company, Highgate Square, Birmingham, are making a speciality of sparking plugs is evident from the two photos that have reached us, no less than ten different plugs being shown on the two pictures.

At a meeting of the Bridlington Rural Council, a resolution recommending that provision should be made for the better regulation of motor-cars on the highways of the county was carried by nine votes to five, and copies were ordered to be sent to the East Riding County Council and the Local Government Board.

A TOUR IN WALES.

A PARTY of nine started from Pontypridd recently on a specially organised motor tour of over 400 miles, arranged by Messrs. Morris Bros., of Pontypridd. The car used was a Daimler, for which Messrs. Morris Bros. are district agents, and was fitted with an awning as a protection against the weather. The first day's run totalled over 100 miles, as the car had to go to Creigiau to fetch some of the party. Proceeding *via* Brecon, Builth, and Llandrindod Wells, the day's run was finished up at Newtown. On Tuesday the run was continued *via* Welshpool and Oswestry, where a stoppage was made for the night. On Wednesday morning Chirk and the pretty Glyn Valley were visited, and thence the route lay through Llangollen and Corwen to Bettws-y-coed and Llandudno. The return journey commenced on the Thursday, with a fine view of the Snowdon range through Bettws and Cerrig-y-Druidion, continuing through Bala along the shores of the beautiful lake and down to Dolgelly for the night. On Friday, the run commenced over the wild passes skirting the Cader Idris mountain, the road being nearly 2,000 feet above sea level, past the small lake at Tallylyn, and into the Corris Valley, noted for its slate quarries and narrow-gauge light railway. Then a rapid descent was made into Machynlleth to view the house where Owen Glendower was crowned. After lunch the day's journey was completed over excellent roads through Caersws and Llandinam to Llandiloos, where some of the ancient relics were visited. Saturday morning turned out wet, but having a complete waterproof covering, the tour was continued past Plinlimmon, *via* Llangurig, Rhayader, and Builth. The weather cleared a little, and good progress was made to Brecon, Merthyr, and home to Pontypridd, all being agreed that a most delightful holiday amongst varied scenery and exceptional surroundings can be made on a motor-car.

THE SCLAVERAND TIRE PUMP CONNECTION.

M R. A. A. GODIN, of 182, Gray's Inn Road, W.C., is introducing an improved form of tire pump connection which appears to possess some advantages. The new connection, which is in the shape of a tap, is intended to do away with the trouble and inconvenience caused by the old style of connection and the consequent twisting round of the pump every time the tire is blown up. As will be seen from the illustration, the connection is made by simply turning round the milled head. It is made to fit the Dunlop, Michelin, and Sclaverand valves (called in this country the Continental valve). A connection can also be supplied to fit the larger Dunlop and Michelin valves.

MOTOR-CARS were used on a larger scale than ever in this year's French military manoeuvres both for the transport of officers and stores.

FOLLOWING the Erie-Buffalo sweepstake which is being organised by the Automobile Club of America, a week of speed contests for motor vehicles is planned to take place on a mile track at Fort Erie, across the Niagara River from Buffalo, under the auspices of the Buffalo Automobile Club.

THE *Matin* publishes an article on the automobile by M. André Berthelot, son of the politician, who is also a leading chemist and member of the French Academy. M. Berthelot considers that automobile races have served their purpose. He believes that the future of the motor-car is as a useful means of locomotion for professional people. In his opinion, if France will encourage motor touring a considerable part of the foreign money which now goes to make fortunes in Switzerland and Italy might be attracted to France.

CONTINENTAL NOTES.

BY "AUTOMAN."

SOME curious experiments in wireless telegraphy were made during the French manoeuvres between a fixed post, on the one hand, and a balloon and a motor-car on the other hand. The motor-car was supplied with a very curious arrangement for receiving the signals, which looked very much like a chimney stack. The car employed for this purpose is a De Dion steam-car, weighing nearly five tons, and capable of doing ten or twelve miles an hour; a metallic cylinder about nine yards high and entirely electrically insulated from the vehicle, is carried on the roof; on the top of this are the electric points, from which wires descend to the instrument room, which is at the back of the carriage. One of the great advantages claimed for this travelling telegraph office is the possibility of being able to telegraph whilst it is moving.

THE misfortunes and narrow escapes of M. Santos-Dumont continue, and at the same time, the indomitable perseverance and courage of the young Brazilian seem to increase. On Thursday, last week, his No. 7 was taken out of its shed, and flew successfully on to the race course at Longchamps, where the usual evolutions were carried out in the usual brilliantly successful manner. A speed of twenty-five miles an hour was easily attainable, and the flying machine showed itself to be completely under control. But presently the aeronaut miscalculated his distance and scraped the branches of some trees, which ripped the silken cover of the balloon, and it immediately collapsed, precipitating the keel to the earth with considerable force. The light wood of the keel was again shattered to atoms, but M. Santos-Dumont stepped out of the cage uninjured. He proceeded, as usual, to pick up the pieces, and calculate how long it would take him to produce his No. 8, with which he is fully confident of being able to win the Deutsch prize.

WITH regard to the prize itself, a misunderstanding which I mentioned in last week's Journal is not yet cleared up. M. Santos-Dumont argues that a racehorse has gained the prize when it passes the winning post, not after the jockey has thrown down his reins, and the groom has taken hold of them, and he says that he will bring his machine back to the Aero-Club grounds, but he has absolutely forbidden his men to take hold of the guide rope, as he alleges that any precipitancy in this direction will be dangerous both to himself and to his men, from the fact of the proximity of buildings. M. Santos-Dumont adds that the money prize of M. Deutsch has never attracted his attention, and that if he wins it, he will give half of it to the poor, and the other half to those who have assisted him, so that, should the judges not consider that he has fulfilled all the technical conditions, the loss will be to the poor, and not to himself personally.

THE latest entry for the Deutsch prize is by M. Snutter, whose flying machine is to be ready in October: M. Snutter does not employ a motor, but relies on human power to work two big wheels, one at each side of his balloon. Of course it would be easy enough to add a motor to this machine if that were necessary, but still, much useful scientific work could be done by a flying machine propelled by human power, if it were practicable.

THE automobile is assuming a most important role in the French Army. General Brugere on his Serpollet may be seen frequently tearing over the roads, and raising a cloud of dust behind him. Behind him follows a spare car, ready to pick him up should his car break down. After this follow the officers of the Staff in *voiturettes*, so that should it be the desire of the General to visit any particular regiment, he could do so at a speed that has never before been possible, and thus no officer knows now at what moment the General may turn up. With the adoption of the motor-car for military purposes a new and great controlling power will come into existence, making the commanders of units particularly careful with regard to the food, lodging, and good

order of their troops, as the General may come upon them at the moment when they least expect him and find them at fault.

THE Emperor of Russia expressed a strong desire to study the automobile from a military point of view during his stay in France, and special instructions were given to military automobilists, so that the greatest number possible might manoeuvre and show their capabilities in the presence of the Tsar.

KING Victor-Emmanuel III. and his court continue to be fervent devotees of the automobile. His Majesty is at present at Racconigi, and the other day the Duke des Abruzzes, with the Duchess Hélène d'Aoste as a passenger, drove over from Turin to visit the King after lunch. An excursion to Pollenzo was proposed, and the Royal party set out in two motor-cars for a four hours' run. The party consisted of the King and Queen, the Duke d'Aoste and his wife (the Princess Hélène d'Orléans), the Princess of Battenberg, and the Duke des Abruzzes.

MR. SIDNEY H. HOLLANDS takes advantage of a self-evident clerical error in my remarks on gravity *versus* levity. All the context, together with the arguments I have quoted, show that in my reference to the penny balloon and the pigeon the comparison is used as an argument by the aviationists, and not the advocates of levity. But here Mr. Hollands misses the point entirely, and I cannot accept his definition of the difference between levity and gravity principles, and see no valid reason why man, recognising the futility of an attempt to construct a flying machine, the motive power of which should have the same relation to its weight as a bird's wing power has to its weight, should not employ hydrogen gas to counterbalance the difference.

WITH regard to the well-known researches and experiments in steam flight and soaring which Mr. Hollands quotes, surely he does not wish the uninitiated public to believe that any practical results have been achieved in this direction. If so, I am glad of this discussion, which enables me to enlighten the public. Meritorious and interesting as these experiments have been—and all honour is due to those who have worked in that direction—is there one of them to-day that has any chance of starting from Suresnes, rounding the Eiffel Tower, and sailing back to Suresnes? The future may reserve possibilities for the advocates of "no hydrogen," but at present the field is barren of practical results, whilst advocates of the navigable balloon have the practical results of several experimenters to encourage them, and M. Santos-Dumont, with the first *gravity* navigable balloon, should in my opinion be applauded and encouraged to press on to a conclusion in a direction in which he has already achieved practical results. I am not alone in my opinion, for I see that the Commandant Renard, in an interview with the correspondent of the *Figaro*, says, "For the present we must content ourselves with steering balloons."

THE 40 h.p. Panhard car driven by Mr. C. Jarrott in the recent Paris-Berlin race is now in England. The other day we had an opportunity of inspecting the flier at 14, Regent Street, S.W. The car has a number of special points, to which we shall probably refer in a later issue.

OWING to the great advance in the cost of materials Weston Motors have found it necessary to issue a notice relative to an increase of catalogue prices. Their cheapest model (Spindle seat Stanhope) is now listed at £190, other cars being proportionately advanced.

THE De Dion-Bouton Motorette Company, of Brooklyn, N.Y., have sent us a copy of a booklet of instructions for their Motorettes, which they have recently issued. While the work is devoted to a description of the De Dion type of motor and vehicle, it will be found extremely valuable to any one desiring to become familiar with the four-cycle type of explosive motor in almost universal use on motor vehicles. The De Dion motor is illustrated and described in detail. The vehicle is also treated in the same manner, and full instructions for the operation and care of the car are given.

LAMPS FOR VOITURETTES AND MOTOR-CYCLES.

MESSRS. SALSBURY AND SON have just put on the market a series of smaller sizes of the now well-known Salsbury-Bleriot lamp suitable for small voiturettes and motor-cycles. These smaller-sized lamps give a light almost equal to the powerful Salsbury-Bleriot light already adopted in such considerable numbers for the largest automobiles. This is arrived at by separating the generator from the lamp itself.

The above illustrations show the generator and the cartridge with the gas-bag and tubing for conducting the gas from the generator to the lamp and also the lamp itself. The generator is fixed by suitable clamps on to the back axle of a motor-tricycle or voiturette. The gas-bag which is supplied with the lamp is employed to make the connection between the generator and the length of copper tube which serves to conduct the gas to the lamp. Owing to the ductility of the copper it is easily bent round angles, and the necessary clips for holding it in place are also furnished. The connection between the copper tube and the lamp is made by a short length of rubber tubing. In addition to their brilliant light, these lamps have the advantage that the charge can be left in the generator for days at a time without the gas escaping or the charge wasting in any way.

It is announced that a motor-car service is to be established on the eastern seaboard of Ceylon.

ON October 24th there will be a motor-cycle race at the Park des Princes, in Paris, organised by the *Auto-Velo*. The distance covered will be 100 kilometres. The contest is open to all motor-cycles weighing less than 50 kilos. empty.

CALLING in at the depot of the Locomobile Company of America at South Kensington the other day, Mr. W. M. Letts took us for a tour of inspection of the extensive enlargement scheme they have at present in hand. To begin with, the existing depot at 52, Sussex Place, has been found too small, and consequently the company has taken Nos. 39, 40, 41, and 42 in the same block of buildings. When we called these were in the hands of the decorators, and are likely to be so for about another fortnight. Large and handsome offices are being built, and when the alterations in hand are completed the Locomobile Company will undoubtedly have one of the largest if not the largest motor depot in the country. The extensions which the Locomobile Company have in progress do not end here. It has been decided to entirely control the company's English business at South Kensington, and with this in view a large area of land at the rear of the present depot has been acquired. Here workmen are at present busily engaged on the erection of a large warehouse and works, where not only will a large stock of cars be kept, but facilities provided for assembling and packing cars for shipment on a large scale. Still another section is to be added, in which users of Locomobile cars may drive and have their vehicles cleaned and refilled with petrol and water "while you wait." Everything that can be done to facilitate the use of these steam-cars in London is to be done, for the plans of the new extensions even provide for the laying out of a pleasant little garden, where, while waiting for their cars, "Locomobilists" may sip a pleasant cup of tea and talk "Locomobilmism" to their hearts' content.

Motorists in the Air.

CORRESPONDENCE.

MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As I intended from the first purchasing a motor-bicycle, but wished to find out the relative advantages of each make before doing so, I have read with great interest the correspondence of the last few months relating to them. After carefully considering the designs and make of each, I decided to try a "Phoenix," as both the general arrangement of machinery and distribution of weight appeared to me to be the most satisfactory. I accordingly arranged with the maker for a trial run. A new machine, which had not been on the road more than a mile, and that for trial purposes, was placed at my disposal, and arrangements made for a run into Suffolk at the following week end, particulars of which may be of interest.

We started on the Saturday afternoon from Holloway about 4.30 in a slight rain. I felt rather nervous as to control and general manipulation, but was surprised to find before reaching Finsbury Park that I had the whole apparatus well in hand. On reaching Tottenham we had to put up for about one and a half hours, as it rained in torrents, the whole district being flooded during that period. On resuming our journey we had to ride over half a mile through water varying from 1 in. to 6 in. in depth. This was decidedly not a fair test, but we came through without mishap. It continued to rain all through to Chipping Ongar, the roads being very heavy. It apparently had not rained beyond here as, on continuing at 8.30 after refreshment, the roads were good and dry through to Chelmsford, and continuing on through Witham and Kelvedon, where we turned off the main road, and passing through Coggeshall and Colne, we arrived at our destination for the night at 10.30. This last two hours was the smartest travelling I had ever done. The following day we rode to Bures, and ran through Lammarsh, Penmarsh, Maplested, Wickham, Castle Hedingham, to Halstead and back, all through an extremely hilly district, being out about two hours. We returned to town on the Monday through Halstead, Gosfield, Braintree, Rayne, Dunmow, Hatfield, Broad Oak and Stanstead, without the slightest mishap throughout.

As a result, I ordered a machine, and have since travelled about 1,000 miles without any failure whatever, and the sparking cell only having been charged once. I may say the machine has more than fulfilled my expectations, and that I am extremely pleased with it in all respects. As regards consumption of petrol, I find that over average roads the machine will run about 200 miles with the full supply, of course including that carried in the spare tank. This extra supply is a very great advantage. The twisted leather belt is also very convenient, as in the event of stretching it can be tightened instantly. I have not yet met any hill that with pedalling I have not been able to ride, but I always do this even on an ordinary hill, as the slightest assistance on the incline makes a considerable difference to the speed travelled, and it is really no labour whatever.—Yours truly, A. V. GIFFKINS.

THE LISIEUX ACCIDENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, Mr. A. Little, judging from his letter, did not read the paragraph in "Automan's" notes to which I took exception, otherwise he would have seen the motive I had in view. I hold no brief for the Comte de Villeroi; my object was simply to have a wrong righted, as it not only cast a reflection on the Comte but on the whole of the motorists in France.

The only conclusion to be arrived at from the paragraph I refer to was, that some motorist had deliberately run over and killed an "Octroi" man, and bolted at full speed so that it might not be found out who he was. This, I maintain, was a libel on the motorists of France, and I addressed my letter to you to place the full facts in your hands for publication. It is not necessary for me to go into any of the other points mentioned in your

correspondent's letter, beyond saying that he is sadly wanting in gentlemanly courtesy when he doubts the word of the Comte de Villeroi. The full facts of the accident were in my hands some time before the publication of "Automan's" notes.—Yours truly, AN OCCASIONAL MOTORIST IN FRANCE.

NOISY EXHAUST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to your correspondent *re* noisy exhaust, I have wrapped my silencer— $3\frac{1}{2}$ h.p. De Dion voiturette—with $\frac{1}{4}$ inch sheeting of asbestos, and inside each compartment have fixed a lining of same material, of course taking care not to block air holes and securing the asbestos so that it cannot work round. I have driven several hundreds of miles since I made this arrangement and find it effective and apparently lasting.—Yours truly, W. P. SHAW.

FURIOUS DRIVING AND THE SPEED LIMIT.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—In the valuable and interesting reports you give of the furious driving persecutions—I beg pardon, I mean prosecutions—I note that in nearly every case the defendants try to evade the consequences by giving as an excuse that their car was running badly, was geared low, etc., etc. I am surprised at their increasing the costs by explaining to the magistrates, who are usually too ignorant technically to understand, and who are almost without exception horse breeders, horse owners, or have direct or indirect pecuniary interest in horseflesh, and therefore are biased against the motorist, before even the police officer opens his lips to utter his sacred and infallible testimony. The very best thing the defendant can do is to plead guilty and think his contempt of the bench, consoling himself with the thought that before many years are past the English bench will be purged of those unprogressive obstacles to the development of a great industry.

I may say a word here in favour of the police. During the thousands of miles I have motored I have found them to be a fine lot of men; they have always treated me fairly, and any prosecutions they are mixed up with must not be put to their discredit, for if we could only look behind the scenes we should see the prime moving cause at work, viz., *The Great Horse Interest*. This is what we are fighting; the bulk of the magistrates are subject to its influence, besides innumerable men in public positions—men who urge the chief constables to worry motorists, and of course the police obey the orders of the powers that be, and small blame to them.

The question, therefore, arises, what is to be done? Well! One solution is to travel slowly, another is to unite and try to get the ridiculous law altered. I know there are several members in the House who are itching to get the speed limit raised; a little pressure from a few influential people and the deed would be done. I think no stone should be left unturned by the rank and file of motorists to achieve this result. Personally, I will put my hand in my pocket to subscribe to the expense of issuing appeal sheets to be printed at your offices, and circulated in all places to be signed by motorists all over the country. The £5 fines that have already been legally abducted from their rightful owners' pockets would have paid for an elaborate system of petition canvassing. Let motorists approach the Members for their towns, and at least get to know whether they are for or against the great cause. What we want is energy; we are fighting ignorance and prejudice, just as the first railways fought them: men whose one creed is "because a horse cannot go more than twelve miles an hour nothing else has the right to." Let the readers of the *Motor-Car Journal* write you a postcard, Mr. Editor, and state whether they are in favour of taking up this much-vexed speed question.—Yours sincerely,

D. L. REANEY.

MR. HARMSWORTH'S motor-car has been a prominent feature of his electioneering campaign in North-east Lanarkshire.

LONG-DISTANCE RUN OF AN ELECTRIC CAR.

THE electric car "Powerful" returned to the works of the British and Foreign Electrical Vehicle Company on Friday, the 20th inst., having completed 1,161 miles since leaving London last month for Glasgow. The car returned through Liverpool, Manchester, Crewe, Birmingham, Gloucester, Bristol, Salisbury, and Winchester, and reached Mr. Henry Leitner's works at Woking on the 19th inst., where a large

GOING UP SHAP.

number of friends were present to welcome the party. During the whole tour only one accident occurred, and that was of a trifling nature, being a short circuit in one of the motors. This happened during the Trial week at Glasgow, and necessitated the loss of one day.

Scarcely any tire trouble was encountered throughout the whole tour. Three punctures were caused through running over nails and glass, and on one occasion the stitching of the seam of the canvas in one Michelin outer cover was cut, which made it necessary to put on a fresh outer cover, as the repair could not be effected on the road. The accumulators stood well throughout the journey. These cells have now carried the car well over 3,000 miles, 12 per cent. of the positive plates alone having been replaced. It is anticipated that another 2,000 miles at least will be run without any serious repair being necessary.

The cost of electricity, housing, washing, and cleaning, and night attendance throughout the tour, including the Glasgow week, amounted, we are informed, to £12 12s. 4d., or 2½d. a mile. The car carried four passengers and a considerable amount of luggage throughout the greater part of its long journey. The longest run on one charge was eighty-four miles, but care was taken to make most of the runs less than seventy miles, to allow for

A REST AT STILTON.

every emergency of weather and condition of road. The car was charged eighteen times (excluding charges during the Glasgow week). As a rule this was done at the various corporation electricity works, but in some cases private stations and collieries willingly supplied the current. The journey may be taken to have definitely proved the facility with which long tours can be undertaken on an electric car, at a very reasonable cost.

FLOTSAM AND JETSAM.

BY "FLANEUR."

THE puff preliminary had done its work. One was assured that the prime sensation of the new piece at Drury Lane was to be an episode in which a motor-car was the predisposing cause of the mighty thrill without which no melodrama is complete. And so, after becoming protestation to the wife of my bosom that I was bent on business rather than pleasure, I parted with the necessary quantum of shillings at the box-office and gave up my Saturday evening to "The Great Millionaire." Now, Mr. Cecil Raleigh, as I know of old, is wont to put his tongue in his cheek when he writes down to the level of the meanest intelligence, and the drama of Drury Lane is superior only in its setting to the lurid efforts of transpontine genius. But in the elaborateness of that setting, and in the modernity which is its dominant note, one has usually found the needful palliation of the otherwise wholesale lack of artistry in the production. We had last year, for example, in "Hearts are Trumps," a presentation of a London music hall, both behind the curtain and in front, that was worthy of all praise by reason of its vivid actuality. The Alpine precipice scene, with the avalanche that overwhelmed the villain of the play, had also no small measure of verisimilitude to recommend it. So, in "The Great Millionaire" I looked for realism, if not for art.

INTO the ramifications of the plot I am not supposed nor disposed to enter here, but will only deal with the automobile interest—or dearth of it—of what proved to be a very tawdry play. The first mention of a motor-car is in the Fourth Act, Scene I. The millionaire, Campbell, is rapidly going mad with anxiety as to his long-lost daughter, who is lying upstairs in a condition that causes grave concern to the assembled doctors. This is at Deerwood Towers, in Devonshire, the home of Lord Deerwood, who is in love with the sick girl. Suddenly Deerwood enters with a rush, but with few traces of a long journey, and hands the chief physician a bottle of medicine which Deerwood has driven to London and back to fetch in his new and fast motor-car. He makes some indistinct allusion to going there and back in thirteen hours, but the point was not well driven home, neither was it made clear that the car had saved the situation. The villain of the piece, Denby Grant, who is secretary to Campbell, has meanwhile persuaded the over-wrought millionaire to part for the first time with his private telegraphic code. A few moments afterwards a loud clattering noise is heard outside, and the millionaire angrily calls for its immediate suppression. Subsequently Lord Deerwood comes in, looking scared, and announces that the safe is open and the cipher gone! Then the millionaire realises that he has been duped, and that the loud noise that had been heard some time before was the starting of the motor of the very car on which Deerwood had travelled to town and back, and on which Denby Grant was now speeding away with his ill-gotten prize. In the confusion which follows the audience conveniently ignores improbability number one, which is that Grant could have got away unobserved when Campbell gave imperative orders for the noise to be stopped outside.

LORD DEERWOOD then soliloquises in the accepted melodramatic fashion, and goes off crying, "It is a race for a fortune, and I'll win it if I have to die for it," from which one deduces that he has another motor-car in his stables, though he does not say so in set terms. The next scene shows us the interior of a country inn, on the road to Plymouth. Kate Cagney, who is in love with Denby Grant, awaits him here, and on his arrival, in leather jacket and cap, he informs her that a second car is in hot pursuit, and begs her to do her utmost to detain it by one pretext or another, while he hastens to the coast, where the yacht of Julius Trent awaits him. Trent is Campbell's financial rival, who has bribed Grant to steal the private code. Miss Cagney cries, "I'll stop that car if I have to fling myself under the wheels!" Grant goes out into the tempestuous night, heedless of the warnings of the landlord. This landlord, by the way, is

made to provide a little comic relief by reason of his comments on automobilists. Here is one of his chief efforts:—"Flies in their eyes, dust in their throats, and working like slaves—and they calls that pleasure. But, bless you, they would not drive an engine for wages, not them!"

MATTERS should now be tending to a climax, but they lead to bathos. The next scene shows Grant outside the inn, and the car motionless with its back towards the audience. In the dim light its type is indeterminate, but it has tiller steering. Grant cannot start the car, and calls out for a smith. Enter Solomon Dawes, a gipsy, just escaped from Dartmoor, where he had been "doing time" for poaching on Campbell's estate, and convicted mainly through the evidence of Grant. "I can do a bit of smith's work," says Dawes, and Grant cries, "Look at that brake, and see if you can make it act." Dawes then gives a few taps, and, *mirabile dictu*, the trouble is remedied. Then a voice is heard shouting, "Stop! Stop! Denby Grant, stop!" Dawes thus realises the identity of Grant, whom he had not recognised in the dark. "Denby Grant," he soliloquises, "the man what made me a convict! I have got 'im 'ere to my 'and." "Come on! come on!" shouts Grant, but Dawes still soliloquises. Then Grant offers him £20 to drive him to the cliff, and Dawes, meditating revenge, takes his seat on the car. The whole sequence of events up to now is wildly improbable. A convict who has been incarcerated for a lengthy period is not only able to repair a motor car of the latest pattern, according to sundry glancing allusions, but even to mount and drive it with ready confidence, although even before his conviction he was only a poaching gipsy. Moreover, though the pursuing car is near enough for Dawes to hear Lord Deerwood's frantic calls to Grant, a long parley can ensue between Grant and Dawes without Deerwood overtaking them!

THE next scene is supposed to be a triumph of stage realism, but to the practical automobilist its ineptitude is contemptible. By means of a cinematographic reproduction of the Plymouth road, moving towards the audience, the car—still with its back alone visible, is supposed to be speeding forwards. There is never for one moment, however, a suggestion of real travelling. The car is made to sway laterally, and the occupants indulge in the most violent and inexplicable movements. I have sat by the side of men driving at all speeds from two to sixty miles an hour, but never have I known one wriggle and writhe in his seat as these two freaks at Drury Lane. Jets of steam are thrown up behind the driving wheels to simulate dust, oblivious of the fact that the night is wet. Worst of all, however, is the "biograph" itself. It wobbles frightfully, and at one moment makes a bound which would imply the entire upheaval of the huge masses of rock which line the road. Finally the car slips from view, supposedly over a precipice. A moment later a voiturette is pushed from the wings—the engine is quite silent—and a shadowy figure (Deerwood's) walks across the stage. Curtain.

In the fifth scene the foot of the precipice is shown. A detached wheel and a few splinters lie around, together with the corpses of Grant and Dawes, and steam floats upwards from behind a rock on which the car has come to grief, the said rock being conveniently placed there to avoid the necessity of showing all the broken parts. Deerwood appears, having clambered down the cliff, and his first thought is for Grant's wallet, in which the secret cypher is duly found. Exit Deerwood, with scarcely a glance at the bodies of the men who have gone to their death. Curtain quickly. The automobile "interest" of the piece ends here, but I am bound to say that it never approached reality for one single instant, and not only does it disgust the automobilist for the reasons above mentioned, and others I have not space to enumerate, but it also fails to captivate the general public. From "the gods" to the stalls there is only one impression visible, and that is the sense of absolute failure. The Drury Lane management must learn something more about motor-cars and their management before they can hope to present automobilism as it is.

A GOOD RUN ON A MOTOR TRICYCLE.

ON Sunday, Mr. Jos. Carter, of High Street, Lynn, successfully accomplished a hundred mile ride on a motor-tricycle, without even a single adjustment being necessary. Starting from Swanley Junction at 8.30 a.m., London Bridge was reached at 10.10 a.m., the bad roads and traffic necessitating slow travelling. Continuing the journey through the City, Shoreditch, and Stoke Newington, Waltham Cross was soon reached. Here a stop was made for refreshment, and Mr. Carter bade farewell to his friends who had accompanied him thither, and afterwards proceeded on his journey via Ware and Royston. At the latter place a halt was necessary to oil a bearing, evidently overlooked. Cambridge was passed through at 2.50 p.m., Ely at 3.55 p.m., Littleport at 4.25 p.m., Downham at 4.57 p.m., and Lynn reached at 5.50 p.m. The motor is a Beeston 1½ h.p., with tube or electric ignition. Only 9½ pints of petrol and one pint of lubricating oil were consumed on the run. The journey to London was commenced by road on Tuesday, the 27th ult., but at Downham the engine failed through a defective crank pin, and the journey was continued by train to London, and the machine towed to Swanley, the destination, by motor-car. Here the machine was repaired by Mr. F. Cox, who thoroughly overhauled it and tested it on the Kentish Hills, mounting gradients of one in six without pedalling. This is not the first motor Mr. Cox has improved, he having last week no less than five to overhaul, one Benz car subsequently mounting Farningham Hill at 6½ miles per hour fully laden, which previously required assistance from the rear to assist it up the same incline. Had it not been for the hot bearing, which probably was not oiled before the start, the tricycle could easily have covered over 100 miles without a stop. The plug used was a Reclus and the trembler a special one of Mr. Cox's own manufacture, with an appliance to prevent oil getting to the platinum points. Neither the trembler nor the plug were touched during the journey.

AILS CRAIG MOTOR-CAR SUPPORT.

THE accompanying illustration shows an improved form of jacking stand for motor-cars which has been put on the market by the Ailsa Craig Machine Company, of Grand Parade, East Putney. It will be observed that the action of the new jack is a rack actuated by a key moving in turn a worm and gear wheel. Hence ample power is obtained even for heavy cars, while, on the other hand, the stand is small enough to

go under a tricycle, making it therefore of practically universal utility to motorists.

The width of the stand is instantly adjustable; it is only necessary to loosen the finger bolt which holds the sliding rod, and the apparatus can then be opened or closed, as the shaft connecting the gear wheels is square. A further advantage is found in the fact that one end of the long rods can be entirely disconnected if desired, and the machine used as a single jack.

THE question of where to keep one's motor-car finds an easy solution at the hands of Messrs. Boulton and Paul, Limited, of Norwich, who make a speciality of portable wood and iron buildings for that purpose. The motor-car houses are made in several sizes and are fitted with skylight, double doors, ventilating window, etc.

THE CARE OF A MOTOR-CAR.

THAT motor-cars are very often unsatisfactory is a question which cannot be disputed. But why is this? There is one very good reason—simply this—the owner of the car does not give it the attention and care that is necessary for its good running. Quite a large number of people are “off” motor-cars altogether because they either could not or would not give their vehicle proper attention. Nowadays, when motorists are getting rather a close time of it, it is necessary that their cars should be as quiet and odourless as possible. All this is a question of cleanliness and care in driving. The writer will proceed to make a few remarks about the necessary care of a motor-car.

The Engine.—If your engine has any exposed gear wheels such as those used for the timing, do not neglect them; if they are allowed to get dry they will chatter in a most unpleasant manner. Always without fail lubricate the engine properly, but do not over-lubricate it, or you will travel in a blue smoke leaving a somewhat pungent odour behind. It is this sort of thing that gives motor-cars the bad name they have in certain quarters. The carburation is an important point, since imperfect carburation means a faulty explosion, and a faulty explosion means an unpleasant smell. Engine bearings must always be watched, as, in careless hands, one may “seize” at the most unexpected and inopportune moment. The writer cannot over-emphasise the fact that proper lubrication is one of the most necessary adjuncts to a sweetly running engine.

The Gear, Driving, etc.—Gear-driven cars are usually the offenders as far as noise is concerned, so a few remarks about the keeping of the gear may not be out of place. There are various opinions as to what to put in the gear box, the usual plan being to put plenty of grease in and then nearly fill up with some good lubricating (heavy) oil. Of course, as no gear box is perfectly oil-tight some will work out, so it is a good plan to put oil in every two or three months. If the car is of the Renault type, where bevel gear is employed on the back axle, the case there should be similarly treated, as the bevel gear gets very noisy if lubrication be neglected. It is shameful to see how some of the gear-driven cars are handled either by extreme novices or people who care nothing for the car. Some motorists appear to think that to get the gear in properly extreme violence must be used, and the result is a horrible noise and, if the gear is overshot, as is very often the case, an engine racing at about 1,200 revolutions. In such a case, how can anyone in the street be blamed for anathematising the car? Speed-changing is a knack which is usually, in careful hands, speedily acquired, and once acquired not easily forgotten.

Brakes, Clutches, etc.—It is unfortunate that some motorists venture out with their brakes in bad order, but such is the case, and about the worst possible thing that could happen to a motorist is his car colliding with anything owing to defective brakes. Motor-cars have the reputation of being able to pull up in a few yards; surely it is better that they should live up to it. Always look after your brakes, and if one is faulty do not go out till it is repaired. One brake at least should work backwards, as if a gear be missed on a hill and the sprag is not down a run back will inevitably result, with more or less disastrous consequences. Some motorists put resin on their hand brakes to ensure a good grip, but it is all the same not an advisable practice, as it is detrimental to the brake. A really good brake does not need it; all that is required is a little adjustment from time to time. In case of emergency resin sometimes has to be used, but it should be immediately washed off with paraffin on returning home. As regards the clutch, it is usually fatal to put resin on it if it slips; the usual result is that the clutch grips so tightly that it refuses to come out when required, and an unexpected occurrence of this kind might have bad results. In all good clutches the tension spring or springs can be adjusted, so resin, etc., is unnecessary. It is a good plan to sometimes rub castor oil into the leather to keep it pliable.

A Few General Remarks to Conclude.—Keep the lamps and plated parts of your car clean. Do not think it a trouble to run

paraffin through your engine occasionally. It is a very good thing to run paraffin through the valves when you are about half-way through a long run. If your carburettor is of the spray type have a look at it every six months; foreign matter often gets into petrol. Have good wire for the high tension and keep the tremblers and points clean, it prevents misfiring.

A Final Remark to Novices.—When you start your engine in a fairly crowded place remember that it usually starts much better when the spark is turned on and the petrol tap open!

R. A. C.

MOTOR CASTINGS.

UP and down the country there are numerous engineers with small plants who have commenced the manufacture of small petrol motors, obtaining the necessary castings from outside. The London Autocar Company, of 182, Gray's Inn Road, London, W.C., appear to be making quite a feature of catering for this demand for castings, they being able to supply sets for engines, both air and water-cooled, from 1½ h.p. to

3½ h.p. Their latest set of castings, of which an illustration is given herewith, is for a small petrol motor of 1½ h.p., suitable for use on motor-bicycles. This set consists of: Two crank cases, in aluminium, cylinder casting, two flywheel castings, piston casting, piston ring casting, connecting rod casting, exhaust gear wheel casting, combustion chamber casting, cover, in aluminium, for contact breaker, and pulley wheel casting. The flywheels are designed and cast in bronze in order that the rims can be filled in with lead to obtain greater weight and power.

WE are informed that Mr. R. H. Griffin, who has for some time past been the Provincial motor representative of Messrs. Brown Brothers, Ltd., of Great Eastern Street, E.C., has now been appointed London City representative for both motor-car and cycle goods, in place of Mr. Philp, who has resigned.

MESSRS. DAVIDSON BROTHERS, the owners of the motor-car wrecked recently between Howden-le-Wear and High Grange, have offered a reward of £5 for information regarding the wreckers. The occurrence is being made the subject of careful inquiry by the police.

HERE AND THERE.

A MEET of the members of the Reading Automobile Club will be held at Swallowfield Park to-day (Saturday).

IN reply to Mr. E. T. Brydges and several other correspondents, the average consumption of petrol of a $4\frac{1}{2}$ h.p. De Dion motor is at the rate of about one gallon per thirty miles.

THE WOLSELEY 5-H.P. DELIVERY VAN TO CARRY 10 CWT.

MESSRS. COOKE AND WADE, of Cutlers' Hall, Sheffield, have been appointed agents for Marshall cars in Sheffield and district.

A SMALL petrol motor of $1\frac{1}{2}$ h.p., together with the necessary accessories suitable for motor-bicycles, has been put on the market by Mr. W. Gummer, of 21, Oakley Street, London, S.W.

TO-DAY (Saturday) is the last day for entries for the usual quarterly 100-mile trial of the Automobile Club, which will be held on Tuesday next, the 1st proximo.

THE Huntingdonshire police, stationed on the North Road, are to be provided with stop watches to enable them to check the pace of motor-cars.

THE motor-car made its first appearance in Llangamarch last week and caused some excitement amongst the natives, few of whom had ever seen such a vehicle.

THE Thornycroft Steam Waggon Company are building a special 4-ton truck for the Burmah Ruby Mines for conveying workmen to and from the works.

MR. F. W. CARVER, of Southtown Dock, Great Yarmouth, is well equipped to carry out any repairs to motor-cars. Spare parts are stocked and an inspection pit is available.

THE Caledonian Motor Car and Cycle Company, Ltd., have sold to Mrs. McDougall, Dalhousie Castle, Edinburgh, through their Edinburgh agents, a 10 h.p. Peugeot wagonette of the latest type and design.

THE Frimley Urban Council have decided to write to Captain Sant, Chief Constable of Surrey, and to the Surrey County Council, urging that steps should be taken to lessen the speed at which motor-cars are driven.

THE Trafford Motor Company, of Ardwick, Manchester, is turning out some neat *tonneau* bodies for motor-cars. Artillery wheels, spider wheels, steering wheels, and differential gears are also made by the company, which undertakes repairs of every description.

MESSRS. MOORE AND OWEN, of Coventry, have sent us a sample of "Garlio," a cloth for cleaning purposes. It is loosely woven in handy 18 in. squares. It possesses strong absorbent properties, is non-inflammable, easily washed, and very durable.

AT the last meeting of the Nairn County Road Committee, some members said that motor-cars were run in the locality at speeds of from twenty-eight to forty miles an hour, and condemned such reckless driving. One gentleman said they would support any measure suppressing the "curse."

LORD KINGSBURGH has a cunning, albeit useful, device on his Delahaye car, and what apparently looks like a basket for holding sticks, etc., is in reality a masked petrol can. Again, on one of the French Panhards in the Glasgow trials the wings were also utilised to carry baskets to hold spirit.

THE Agent-General for Victoria is having a special report prepared for his Government on the trials of heavy motors which took place recently in the Liverpool district. He thinks it might be found practicable to employ a service of such vehicles as a substitute for, or auxiliary to, light railways in some of the more thinly-populated districts of Victoria.

THE Clerk to the Bourne Guardians and Rural Council at a recent meeting read a letter from the Grantham Rural District Council, relative to the County Council being asked to frame by-laws for the regulation of all motor traffic on the highways. The Highways Committee recommended that the Council endorse the action of the Grantham Council, and pass a similar resolution, which was unanimously agreed to.

MR. SANDARS, of Lincoln, early this season bought a $4\frac{1}{2}$ h.p. De Dion voiturette exactly the same as that supplied to the Right Hon. A. J. Balfour. This car has proved so satisfactory that his brother, Mr. J. D. Sandars, of North Sandsfield, Gainsborough, placed an order for a $4\frac{1}{2}$ h.p. car of the same make, which has lately been delivered to him. Though Mr. Sandars has had very little previous experience, he drove the car about 500 miles the first week without the slightest trouble or accident.

THE E. R. Thomas Motor Company, of Buffalo, N.Y., is issuing an illustrated pamphlet descriptive of the Thomas motor-cycles and motors. First of these is the "Auto-Bi," of which a good account is given; also some useful hints to its users. The "Auto-Tri" follows, and is treated in the same way. Then comes an account of the Thomas motor, and the means used to convert an ordinary bicycle into a motor-bicycle.

AT Bow Street Police Court, last week, H. F. Lowe, described as an engineer's assistant, was charged on a warrant with obtain-

THE WOLSELEY 5-H.P. DELIVERY VAN WITH TOP REMOVED.

ing money by false pretences from Mr. Paul Hensel, of Rochester Row, a merchant. Mr. de Rutzen said, "There will be a remand, and I shall admit the prisoner to bail in his own recognizances of £100." Detective Bissill, however, stated that there were several other cases against the accused, and, after evidence of arrest, the magistrate remanded him in custody.

THE English Motor Club will hold a club run to Frensham, in Surrey to-day (Saturday), staying at the Pond House Hotel overnight. The start will take place from Westminster Bridge at 2 p.m.

LADY CURZON of Kedleston arrived at Aberdeen from Braemar on Sunday, and afterwards left for London. Her ladyship made the journey of sixty miles from Braemar in a motor-car.

WE learn that M. Marconi, of wireless telegraphy fame, has joined the ranks of automobilists, he having just placed an order with the Motor Manufacturing Company, Limited, for a Werner motor-bicycle.

THE Motor Mart, 108, Euston Road, N.W., has, for the convenience of callers, fitted up a notice board, on which may be seen all the latest entries to the Mart and the latest additions to its show rooms.

THE Bradford Motor-Car Company, of Belle-vue, Bradford, having just purchased a large number of Pieper voiturettes, have decided to offer the first dozen of the same at the temptingly low price of 105 guineas each.

PARIS is copying London's example in the way of a motor street-watering van, a De Dion steam-waggon having lately been fitted up for this purpose and used in the Avenue du Bois de Boulogne.

LADY ROSSLYN, who recently purchased a 6 h.p. Mors car from the Roadway Autocar Company, has become quite an enthusiastic motorist. She now drives the car herself, and expresses herself as being delighted with it.

WE understand that Colonel Holden has purchased, through Messrs. Friswell, Limited, a Koch heavy oil car for experimental purposes. The Erasmic Soap Company has also through the same channel purchased a Peugeot for advertising purposes.

AT the last meeting of the Wellingborough District Council the assistant surveyor reported as to the cost of motor refuse vans, and the matter was adjourned for presentation of designs and further particulars.

THE Collier Twin Tire, which has come so much to the fore lately, and for which the manufacturers claim the triple advantage of absence of punctures, burst tubes, and creeping, is now made in all sizes, from 26 by 3 by 3½ in. to 40 by 5 by 5½ in.

SEEING the new Dennis (Guildford) car passing along Oxford Street the other day, with Mr. Dennis driving, we hailed him and had a short ride. The car travels very smoothly and quietly, and with its *tonneau* body and long bonnet has a very graceful appearance.

SOME of the good people down Tunbridge Wells way are protesting, through the medium of the local Press, at the iniquitous practice of running public motor-cars on Sunday between Southborough and that town. The popularity of the service on that day, as well as other days of the week, proves that this view of the case is only held by a small and narrow-minded minority.

HAVING made special arrangements with the Peugeot Company with regard to the sale of their cars next year, Messrs. Friswell, Limited, of 48, Holborn Viaduct, have decided to hold a sale of the whole of the present stock of motor-cars, which includes Panhards, Mors, Benz, De Dion, etc. For immediate clearance the vehicles are being offered at tempting prices. Country agents would do well to send for a copy of the list that has been prepared of the vehicles offered.

"KILLARNEY and Round About" is the title of a little book written by Bella Sydney Woolf and Thomas Julian Goodlake, and published by Hodges, Figgis, and Co., Ltd., Grafton Street, Dublin. Although we should have liked to have seen some illustrations in the book, it is one of the most interesting productions of the kind we have ever perused. That the writers are appreciative can be seen from the very first pages, and the story carries one along so that one almost fancies they are participating in the trip described.

AT the last meeting of the Ilminster Rural District Council a communication was received from the Long Ashton Rural District Council asking the Council to pass a resolution in favour of restricting the pace at which motor-cars may travel, also that such cars should be licensed and carry a number front and back in figures at least six inches long. The communication was discussed and several members considered the pace of motor-cars should be further restricted; the Chairman, however, said he should like to see them go at sixty miles an hour!

MR. J. GRANT LAWSON, M.P., Parliamentary secretary to the Local Government Board, has been telling those present at the Easingwold Agricultural Show, that the motor-car industry should have "A perfectly fair field and no special favour. It would not be a bad idea," he gravely added, "if motorists were compelled to have their names and addresses on their cars, with a dial indicating the speed at which they travelled."

MESSRS. SHIPPY BROTHERS, inform us that they have appointed Messrs. A. R. Atkey and Company, Ltd., of Nottingham, their agents for the sale of the "Milwaukee" steam cars, the "Still" electric vehicles, "Ideal" storage batteries, "Diamond" tires and other American specialties supplied by them. Messrs. Atkey and Co. have a small electric parcels delivery cart on view in Nottingham, specially built for the express delivery of tradesmen's goods up to 2 cwt.

A MOST unfortunate illustration of the danger of "hanging on" to a motor was the fatal accident which befell Miss Leaver on Sunday last. The young lady was cycling at Shirley Wick, near Stafford, and holding a rope attached to the motor-car of her brother-in-law, Mr. Garnett Oswell, when the latter reduced speed to pass a vehicle. The slackened rope caught a pedal of Miss Leaver's bicycle, and when Mr. Oswell (unaware of this) quickened his pace, the sudden jerk threw the young lady heavily on her head, and her injuries proved fatal a few hours later.

THE Yorkshire Automobile Club will hold a run to Ilkley this (Saturday) afternoon, the arrangements being as follows:—Leeds members meet at City Square, at 2 p.m.; Bradford members meet at Manningham Park (Lister's monument), at 2 p.m.; Harrogate members meet at the Stray (Prince of Wales), at 2 p.m., and at 3.30 p.m., Leeds, Bradford, and Harrogate members unite at Burley, in Wharfedale cross-roads, before entering the village, proceeding from there to the Crescent Hotel, Ilkley. Arrangements for the return will be made en route. The last run, to Boston Spa, was most successful, six cars and nine cycles taking part, and as many members have promised to attend to-day's run, it is hoped that there will be a good attendance. It is again pointed out that these club runs are in no way fast runs, but purely for pleasure.

A MOTOR-CAR furnished by the Bradford Motor-Car Company, of the Drill Hall, Manningham Lane, Bradford, has lately returned from a month's tour through county Durham, the object of the tour being to advertise the *Yorkshire Post*. A start was made on June 18th for York, where two bill distributors, 10,000 fac-simile six-page of the *Yorkshire Post*, Mr. Warburton, of the staff of that paper, and the necessary portmanteaux, etc., were picked up. The object was to work the whole county of Durham with a house-to-house distribution of the fac-similes. A plan of campaign had been arranged, and on the morning of June 19th the work of distribution was commenced in Port Clarence, a distance of sixty miles from York. No record was kept of each day's run, but the total distance covered during the month was 780 miles; and it is sufficient to say that at the end of the month every town, village, and hamlet in county Durham had been visited. We understand that the proprietors of the *Yorkshire Post* are well pleased with the result of the experience with the motor-car as an advertising medium. We may add that throughout the tour the car was driven by Mr. J. W. House, son of the manager of the Bradford Company. Mr. House, jun., is only sixteen years of age, and has been away this season eleven weeks with motor-cars in various parts of the country.

MOTOR-CARS IN MILITARY OPERATIONS.

CAPTAIN R. S. WALKER, R.E., who is at present in Pretoria, and who was one of the senior observers in the 1899 Liverpool heavy motor-vehicle trials, has sent us the following account of his experience with a Locomobile steam-car, and the interesting work he has done with it:—"Several months ago, I noticed a Locomobile car at Cape Town, and, being struck with its simplicity and neatness, bought it, and took it up country with me, with a view to making some tests over bad roads, etc. Its first trip was over a rough course round Pretoria, specially chosen to find out defects before taking the car into regular use. Naturally, as the machine was not designed for this class of work, there were several. In about a month these had all been found out and remedied, and the car was in constant use, taking stores, etc., round the town and forts. It also performed some very useful work in visiting out-stations, where search-lights were either installed or wanted, and in this way nearly all the bigger towns in the Transvaal were visited. It was possible to go round all the likely positions for a search-light in one day, at every station, which frequently meant considerably over fifty miles of most indifferent roads—more than a single horse could have been expected to do—and the car generally carried two people on these occasions. The car was also used as tender to a search-light plant on a gun-carriage and limber, being utilized to fetch gasoline, carbons, water, etc., and also to run the dynamo for charging the accumulators, thus saving running the gasoline motor for this purpose. To do this, the trail of the carriage, on which was the dynamo, was lowered on to the ground, the back of the car was lifted up, one wheel being supported on the dynamo pulley and the other clear of the ground, two bolts being passed through the balance gear to jam it. On one occasion the car ran a 30 cm. search-light for an hour, driving a dynamo in this way. In consequence of this, a trailer has been made to carry a dynamo and projector for search-lighting in the field, but so far this has not been used. The trailer hooks into an eye fastened just behind the balance gear; a Maxim, Colt, or small ammunition cart, etc., could be attached to this same eye.

Undoubtedly the best piece of work done by the car, so far, was its trial trip with the trailer, when it blew up the mines at Klein Nek. These mines were laid some eight months previously, and had never been looked to in the interval. There had been several bad storms; the Boers and cattle had frequently been through the Nek; the latter had been on fire, and finally it was shelled with lyddite. The mines, eighteen in number, were found to be intact except two, which presumably had been fired by the heat of the veldt fire. All the insulation was burnt off the wires, and the battery was useless. It had been anticipated that a dynamo exploder would be inadequate to fire these mines, so a 2 h.p. 250 volt motor, which happened to be in Pretoria, weighing about 3 or 4 cwt., was placed in the trailer; a quarter of a mile of insulated cable, some testing gear, the kits of three men and their rations for three days, with a case of gasoline for the car, were also carried on the vehicle and trailer, and the whole left Pretoria one morning and trekked to Rietfontein. Two of us were mounted, the third drove the car. At Rietfontein we halted for the night, and started next morning with an escort through Commando Nek, round the north of the Megaliesburg, to near Klein Nek, where the road had to be left and the car taken across country through bush veldt. At the bottom, the going was pretty easy; only a few bushes had to be charged down and the grass, etc., rather wound itself round the wheels and chain. As the rise became steeper the stones became very large, and the car had to be taken along very gingerly to prevent the wheels being broken. A halt was made about a quarter of a mile from the top of the Nek, where the mines were situated; these were reconnoitred and the wire, etc., was picked up; that portion which was useless was placed on top of the charges and the remainder taken to the car. The dynamo was slid off the trailer, and the car backed against it; one wheel was raised slightly and placed against the dynamo pulley, which was held up to it by a man using his rifle as a lever; the other wheel was on the ground with a stone under it. The balance gear being free, the dynamo was excited without the other wheel moving, and the load being on for a very short time (i.e., from time of touching lead on dynamo terminal to firing of the mines) no harm could come to the car. When all the leads had been joined to the dynamo, the car was started, and after a short time, when it was judged to have excited, the second terminal was touched. A bang and cloud of dust resulted and the Klein Nek mine field had ceased to exist.

The day was extremely hot, and the work had not been light, so the tea, made with water drawn direct from the boiler, which we were able to serve round to the main body of our escort was much appreciated and washed down the surplus rations we dispensed with to accommodate the battery and wire, which we could not leave behind for the enemy. On the return journey we found this extra load too much for the car, and had great difficulty in getting up to Commando Nek, frequently having to stop to get up steam; these materials were therefore left at the first block-house, and the journey home continued in comfort. A second night at Rietfontein gave us a rest after our labours, and the third afternoon saw us on our way back to Pretoria. As luck would have it, a sandstorm overtook the car. The storm began by blowing the sole occupant's hat off, so, the two mounted riders being a long way behind, the driver shut off steam and chased his hat. In the meantime the wind increased and the car sailed off "on its own," and was only just caught in time to save a smash. Luckily the gale was in the right direction, for the fire was blown out, and it was impossible to light a match in the open. The car sailed into a poort on the outskirts of Pretoria, but we got a tow from a friendly cart through it, and then steamed home after the fire had been re-lit.

The car, as ordinarily equipped for trekking, carries the following:—Blankets, waterproof sheets, etc., etc., for two men; four planks for crossing ditches, bogs, stones, etc.; all necessary tools and spare parts; a day's supply of gasoline; a couple of telephones; one mile of wire. In addition on the trailer, if used for search-lighting:—One 30 cm. projector, fixed between trail; one automatic lamp for ditto; one dynamo—100 volts 20 amperes; two short lengths of wire; two pairs of carbons; tools, etc.

FURIOUS DRIVING CASES.

At Burnley Borough Police Court, Ernest Longford, a motor-car driver, was summoned for being drunk and disorderly. P.C. Greaves said that on the previous afternoon he saw the prisoner driving a motor-car in Westgate in a reckless fashion. Witness had to get assistance to take prisoner to the police station. Prisoner denied being drunk. He was fined 10s. and costs.

At Hailsham Petty Sessions, Arthur Leslie Bucknall, of Folkestone, was summoned for furiously driving a motor-car. It was explained that defendant was unable to be present owing to a pressing business engagement. The Clerk (Mr. Owen Langham): Well, this is a pressing engagement. The Chairman: We shall adjourn it for a fortnight for defendant's appearance.

In the Aberdeen Sheriff Court, a Frenchman, Emanuel Violleau, motor-car driver, lately residing at Invercauld House, was charged with having, on four separate occasions, driven a motor-car on Deeside at a greater rate than ten miles an hour, that being the regulation as to speed then in force. Accused did not appear, but Mr. Alex. Blacklaw, solicitor, said that he represented him. Evidence was given by a large number of witnesses, who spoke to the vehicle going at a rate of from fifteen to twenty miles an hour. The Sheriff said he thought the charge was proved, and a fine of £2, with the alternative of fourteen days' imprisonment, was imposed.

At the Ashford Police Court, Kent, Mr. Maltby and Mr. Greystone, both of Sandgate, were fined, in the first instance £5, and in the second £2 10s. Mr. Staplee Firth defended, and in the course of the evidence two constables, the same in both cases, swore that the defendants were travelling at 22½ miles an hour. The course was a measured one of a fourth of a mile. Before the cases were reached it was noticed the two constables were in communication with each other. The younger one pulled out a note-book, used a rubber, and then rewrote something in it at the dictation of the elder. When the cases came on the witnesses were ordered out of court, and the elder constable, when challenged, admitted that the other's report had been altered at his dictation. The junior, not knowing what had transpired, when in the box stated on oath that the note was made at the time of the alleged offence (September 14th), that he had not erased any part of it, nor altered it in pencil in court; neither had he discussed the subject with the other constable. We understand that a full shorthand note has been taken, and that further will be heard of the matter.

A NUMBER of well-known Coventry automobilists were summoned at Milverton, on Wednesday, for furious driving. They were Mr. Oliver Stanton, Mr. George Iden, works manager of the Motor Manufacturing Company, and Mr. H. W. Bamber, works manager of the Daimler Company. Mr. Staplee Firth, of London, appeared for the defendants. He entered in each case a plea of not guilty. The case against Mr. Stanton was first taken. Inspector Parkinson, stationed at Kenilworth, stated that on Saturday, August 17th, about half-past three, he was on duty on the Coventry Road in company with P.C.'s Mellor and Tolley, watching the road for a distance of a quarter of a mile, which he had measured previously with a tape. He placed Tolley in uniform at the end of the quarter of a mile nearest to Kenilworth. Witness and Mellor were at the other end in plain clothes. Defendant came by from the direction of Coventry. Witness, with a stop watch, tested the time, and defendant's car covered the quarter of a mile in 48sec., which was 18½ miles an hour. Mr. Firth cross-examined witness at some length with regard to the position of the quarter of a mile on the road. Asked where he was standing when he took the time, the Inspector said he stood thirty yards from the point where the quarter of a mile started. Asked whether he, with the other officers, had gone to look out for motor-cars on the day in question, witness replied in the affirmative. Police-constable Mellor gave evidence corroborating the main facts stated by Inspector Parkinson. Police-constable Tolley also gave evidence, and was asked by Mr. Firth: Inspector Parkinson put up his hand for you to stop the car, and then you waited until the car got to the end of the quarter mile before you stopped it. Witness: Yes. Mr. Firth: That being so, Inspector Parkinson signalled you before the quarter mile was finished? Witness: Yes. Mr. Firth contended to the magistrates that from this it was obvious that Inspector Parkinson had anticipated that he was going to stop the car whether it was going beyond the proper speed or not. Mr. Stanton, who was next called, said that on the day in question he was in a three-year-old Daimler car of 5½ h.p. The car was geared to go about 9½ or 10 miles an hour. Mrs. Stanton, who was on the car at the time, said she thought the car was going about the pace of a trotting horse.

This concluded the first case, and, without any decision being given by the magistrates, the case against Mr. Iden was proceeded with. The evidence was very much the same as in the last instance, the same three officers having timed the car. Inspector

Parkinson stated that the car travelled the distance in 45 seconds, which was equal to twenty miles per hour. P.C.'s Mellor and Tolley gave corroborative evidence. Mr. Iden said that he was driving a car that had been brought from Cardiff because the customer was not satisfied with it. From the sound he heard, he found that the induction valve had given way. The car was geared to eleven miles per hour. William White, employed at the Motor Manufacturing Company's Works, said he had driven this car from Cardiff because it was defective. They could only get up to a speed of about twelve miles at the best, and in the distance in question it was travelling at about eleven miles per hour.

The third case was that against Mr. Bamber, and the circumstances were similar to the last, as defendant was behind Mr. Iden's car. Inspector Parkinson said that the whole of the quarter of a mile was done in fifty three seconds, but the first eighth was done at the rate of twenty-five miles an hour. Mr. Firth objected to this latter statement being admitted as evidence. After P.C.'s Mellor and Tolley had been in the witness box, Mr. Bamber gave evidence. He denied that he was travelling at the speed stated by the Inspector, and added that the police officer put up his hand signalling him to stop about a hundred yards from the corner. Mr. Firth, in addressing the magistrates, remarked that Parkinson and Mellor had both got a stop watch. "We have got here," he added, picking up one of these, "a case with some wheels in it, and a spring or two, covered with possibly silver." There was nothing before them to show that this piece of mechanism did the work it was purported to do, and that being so it should be at once ruled out as evidence. Mr. Firth passed on to say that it was obvious from the evidence that the officers that afternoon did not intend to go back empty handed. They were full of zeal, and had got up this show of materiality in the shape of these stop watches. After directing attention to the fact that the Inspector stood thirty yards away from the starting point when taking the time, Mr. Firth asked if it was fair or reasonable that the police, evidently wanting something to do, should go out with an unworthy object such as had been shown that morning? The magistrates after a brief retirement, announced, through the Chairman, that they thought the police were perfectly right in what they did in view of the many complaints of the rate at which motor-cars were driven. The Bench had no doubt whatever that the cars in these cases were going beyond the twelve miles an hour, but they thought the objection must hold good that the watches had not been proved to be correct, and must give the defendants the benefit of the doubt. Mr. Firth asked to be allowed the expenses of some of the witnesses; but this application was somewhat sharply refused.

At Wolverhampton, Joseph Lisle, was summoned for driving a motor car at midnight along the Stafford Road at a greater speed than twelve miles an hour. Defendant and two other witnesses said the car was built two years ago, and could not go more than twelve miles an hour. The magistrates fined him 20s. and costs.

The police at Grantham and in the district have of late received many complaints in regard to the furious driving of motor-cars along the Great North Road. On Saturday week several police-constables were stationed along the road by Superintendent Cabaurn, with the result that four summonses were issued, and the case were heard at the Spittlegate Police Court on Saturday last, when Mr. H. Livesay, of Rotherfield, Sussex; Mr. F. Hutchinson, of Cambridge; Mr. Charles Cordingley, of London; and Mr. Marcus Illingworth, of Bradford, were summoned for infringing a regulation made by the Local Government Board under the Light Locomotives Act, 1896. In the case of Mr. Livesay, Police-sergeant Leach stated that defendant would be travelling from twenty to thirty miles an hour. Witness tried to stop him, and followed on a bicycle. Witness followed defendant to Doncaster, where he saw defendant, who treated the matter as a joke, and said he had not killed anyone. Witness told defendant he was a police-sergeant. Police-constable Gilbert said he timed defendant, who did a mile in two minutes. Thomas Tindall, farmer, of Louthorpe, said on the afternoon in question he met a motor-car, and had to pull his horse and cart off the road, or the defendant's motor-car would have run over him. The car would be going at over twenty-five miles an hour. Mr. John Carter, farmer, of Hoby Lodge, stated that he met defendant with a motor-car, which would be going at from twenty-five to thirty miles an hour. Witness had a young horse, and put up his hand for defendant to stop. Defendant did not do so, and the horse swerved round and just missed the motor car by less than a foot. Defendant refused his address. Superintendent Cabaurn said he had a letter from the London police, who stated that defendant had received three summonses for that journey. The police were allowed special costs, and the chairman said the magistrates thought it a very serious case, and defendant would be fined £10.—In the case of Dr. Hutchinson, Police-constable Bean stated that defendant was travelling on the 14th inst. through Long Bennington at the rate of over thirty miles an hour. Police-sergeant Holland corroborated the evidence of the previous witness, and said he had worked out the pace defendant travelled, and he was going at the rate of thirty-four miles an hour. Police-constable Duffin corroborated, and said defendant gave witness his name and address. Defendant told witness that he should not appear to any summons, as it was no use, as motor-car drivers did not get justice, and it was no use appearing. Police-sergeant Leach and Police-constable Gilbert also gave evidence. There were several previous convictions against defendant, and the superintendent of police (Mr. Caborn) said defendant went at the rate of thirty miles an hour after being warned by the police. Defendant was fined £10.—In the case of Mr. Cordingley, Police-constable Bean said he followed defendant, who only laughed at him. Police-sergeant Holland said defendant was

travelling at the rate of thirty miles an hour. Witness followed, and the car sustained a puncture, and had stopped at Gonerby Moor. Another witness stated that defendant was going at the rate of thirty miles an hour through Long Bennington village. Defendant was fined £10.—In the case of Mr. Illingworth, Mr. White pleaded "guilty to exceeding twelve miles an hour." Police-sergeant Leach stated that defendant was driving a motor-car through Colsterworth on the date in question, and would be going at from seventeen to twenty miles an hour. Police-sergeant Johnson stated that defendant arrived at Stamford at 7.15. Witness took defendant's name and address. Defendant had done the seventeen miles within the hour. Defendant went into the witness-box, and said his average was ten and a half miles an hour on the day in question. Mr. White addressed the magistrates for the defence, and defendant was fined £1. The Chairman remarked that this case was very different from the others.

MOTOR-CAR ON FIRE.

WHEN we ordered our Napier car, in November last, we desired to have both electric and tube ignition, but Mr. Edge declined to fit the latter on the ground that he did not want it ever to be said, "that one of his cars had ever been burnt up." Well, a Napier car has been burnt up, but let us say at once that it was no fault of the car, but might have happened to any motor-vehicle with either or both systems of firing. Mr. Clifton Sharp, an old amateur racing tricyclist, and a gentleman whom we have not seen for at least seventeen years, called on us on Tuesday last, and favoured us with particulars of the accident which occurred on Monday in the Uxbridge Road. He only purchased the car, second hand, about a fortnight ago, and had run several hundred miles on it, being very pleased indeed at the way it was going. On the evening of the mishap he had three Dietz lamps burning—one in front, and two at the sides. Discovering a leakage of petrol on the floor of the car, the driver, a skilled *mecanicien*, drove round a corner, and turned out front and near side lamps, leaving only the off side light burning—with the view of not attracting too much attention. Proceeding to investigate the cause, a sudden explosion took place, the burning Dietz lamp was blown away, and the flames leaped up the top to the petrol tank, which melted, and the car instantly became enveloped in flames. There were three passengers in the back seat, Mr. and Mrs. Sharp, son, and a lady friend. These instantly scrambled over the seats and jumped out; unfortunately, Mrs. Sharp, who is over sixty years of age, fell, and broke one of her legs. Two steam fire engines were soon on the scene and these "played" on the car for nearly an hour, the flames lighting the whole locality. The body of the car was burnt to pieces, as well as the rear wheels, tires, etc., and that which seems to worry Mr. Sharp most was the fact that he had just laid in a new stock of spare valves and other parts. These all disappeared, as well as tools, the firemen with their hatchets hacking and throwing away all they could get hold of. As fast as the things were thrown in the road, so the crowd scrambled for them, and it was only with difficulty the occupants of the car were enabled to ultimately escape in a four-wheeler. Our readers will be pleased to hear that Mrs. Sharp is making good progress towards recovery and is most anxious for her son to purchase another car, as she is looking forward to convalescence and when she will be able to be once more "on the road."

MORE LIGHT WANTED.

BEFORE the Richmond County Bench, Edward Talomonsene, of St. Pancras, was summoned for driving a motor-car without having the proper lights attached, as required by the Local Government Board. Police-constable Sangster proved the offence, which took place on the 8th of this month at Lower Richmond road. Defendant, who did not appear, told the policeman that he was experimenting with a new lamp, and was unaware that a red light was necessary.—Defendant was fined 20s. and costs.

At Llandaff, William H. Lownsborough, engineer, of Cardiff, was summoned for driving without lights. Defendant stated that he had one light, and that as he was riding a motor-cycle he considered that sufficient. The bench, however, ruled that the motor-cycle came under the definition of "vehicle," and imposed a fine of 5s., including costs.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, OCTOBER 5, 1901.

[No. 135.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

REGARDING the note on the question of the speed limit, which appeared in our last issue, we have received a number of communications, all in sympathy with our remarks, and our correspondents are of opinion that the time is now ripe for a vigorous agitation to be commenced for the total repeal of the speed limit. The industry has this year grown to a prodigious extent, and there are now many thousands of owners of motor-cars in Great Britain. We are convinced, from the rank and standing of these gentlemen, that no retrograde movement by the authorities will be successful. Much time and money has been spent by the Automobile Club in an endeavour to overcome the prejudices of the police and the local authorities, and while some good may have been done, yet on the whole we are inclined to think the demonstrations have not been universally successful. It therefore behoves automobilists to urge the matter forward and fight for their just rights, which are the same as those of other users of the roads. More or less than this is neither asked for nor desired.

Motor-Cars in "Greece."

It is announced that there is a project on foot for a public motor service between Athens and Thebes, which, if the historical characteristics of the Athenians persist, must afford them peculiar gratification. They could derive little but pain, however, from hearing the comment of a motorist, whom in mercy we refrain from naming, to the effect that the principal troubles to be expected would be from side-slip. "Why side-slip?" was incautiously asked. "Well, you see," was the rejoinder, "the cars will be running in grease the whole time!" And he escaped while someone was looking for a spanner.

Motor-Cars in the Army.

At a meeting of the Church Society for the Promotion of Kindness to Animals, over which the Hon. C. S. Rolls presided, it has been resolved to call the attention of the Secretary for War to the need of reform in the Army Veterinary Department. This is very desirable, but the society might have gone still further, and pointed out that some of the cost of that department might well be utilised in purchasing and maintaining automobiles. Horses will always be necessary in peace and war; but in the drawing of guns and the transport of ammunition and food for the army the motor-vehicle will have an important place in the near future. This will be an effective way of promoting kindness to animals by relieving them of what are burdens in ordinary times, and manifest cruelties on the field of battle.

A Week End Trip.

SATURDAY last being a lovely day for motoring the temptation for a run was too great to resist, and therefore we made up our minds, in the afternoon, for a short trip to Haslemere, with a view of spending the following day blackberrying. At Cobham, Mr. Harvey Du Cros, jun., on his

16 h.p. Panhard, was seen, but not another motor-car was met. At Godalming, a short stoppage was indulged in—both with the object of having a cup of tea and learning the reason for the liberal display of bunting. It was soon ascertained that Baden-Powell had visited the town for the purpose of laying a foundation stone at Charterhouse Schools.

Baden-Powell and Motor-Cars.

We learnt afterwards that the local volunteers were paraded outside the railway station and that the crowds had intended taking the horses out of the carriage and pulling the General through the town. Great, therefore, was the chagrin of the inhabitants to find that their guest had passed them, escaping unnoticed on a motor-car. The Hon. C. S. Rolls had driven the distinguished defender of Mafeking down from London on his 20 h.p. Panhard, and, if report speaks true, a fairly speedy journey was enjoyed. The General, however, is a sportsman, and, rather than disappoint the crowd, "moted" in procession to the station and back, after the ceremony, proceeding to Cranleigh.

Preferred Motor-Car.

MAJOR-GENERAL BADEN-POWELL, like all who have once tasted the delights of motoring, has set his heart on having a car and has expressed his intention of taking one back with him to South Africa. As our readers are aware, the popular hero has been receiving presents of all sorts and kinds from various committees in different parts of the kingdom, and these gifts, of course, are greatly appreciated. In a recent instance, however, on the occasion of a presentation to him of a valuable chronograph, the General, while thanking the Committee, asked whether it would not be possible to change the article for a motor-car. Unfortunately the change could not be effected.

Hindhead, Frensham, and Winchester.

WHILE pursuing our journey to Hindhead, the sound of a "pip pip" was heard, and Mr. Mayhew, on a 20 h.p. Panhard, passed by. Amongst the passengers we noticed Captain Lindsay Lloyd, who is Secretary to the War Office Committee, organising the Mechanical Traction Trials. The trials, we understand, will take place in the vicinity of Aldershot, and the Captain was then on duty surveying one of the routes. The previous Thursday the Hon. J. Scott Montagu, in company with the County Surveyor, had driven him over some of the routes in Hampshire. This latter car, a 24 h.p. Daimler, seemed to take the Captain's fancy, and we hear he has declared it to be one of the smartest running motor-cars he has yet travelled on, the running being more like that of a locomotive rather than of an explosion engine. At Hindhead, we found both the Huts and Beacon Hotels full up, and therefore proceeded to Frensham Pond, where a number of the members of the English Motor Club had assembled. Mr. Edge had driven down on his 50 h.p. car. All the rooms in this hotel being engaged, after a short stoppage, we proceeded on our way to Winchester, which interesting city was our headquarters till Monday.

Hop Pickers.

THE return journey to town was performed in the same beautiful weather as the preceding days, and until the Hog's Back was reached nothing of note occurred. The "hopping" must evidently have finished on the Saturday, for the roads round and about Alton and Farnham were crowded with "pickers." Some of these were on foot, carrying their utensils, some with barrows, others in caravans and carts, but all having a mighty following of children in various stages of raggedness. The women, with their tanned faces, gaudy colours, and black clay pipes, seemed amazingly happy, and while the men walked together the vehicles were allowed to wander as they liked all over the road. All, however, were good tempered. They waved their hands and cheered, but left the horses to get out of the way at their own sweet will and at such speed as they felt inclined.

Ballooning and Motoring.

ON the Hogsback Mr. and Miss Butler were met, with their Renault car, and in conversation we learnt they were on their way to Aldershot for the purpose of indulging in another balloon ascent. They had been making their headquarters recently at Shere, in Surrey, and the previous day had been entertaining quite a party of motorists, including Mr. Mayhew, Mr. Rolls, and Mr. and Mrs. T. B. Browne, the latter driving a small Renault, etc. Many of the riders in coming down from London had suffered from punctures, and through these luncheon was delayed two hours. The weather had come over very dull, and as there was but little wind about, we rather fancy the aeronauts must have had a poor trip. Lunching at Guildford, we duly reached home without incident or puncture, our Napier having travelled like the good car she is.

Running the Blockade.

MOST Londoners are aware that vehicular traffic is not allowed to cross the Horse Guards Parade. Only the sovereign himself, members of the royal family, and other privileged persons, including, of course, members of the Government possessing passes signed by the sovereign, are permitted to drive through the historic archway. Sir Francis Jeune however, recently ran the blockade. Stopped the other evening whilst riding with Lady Jeune in his motor-car in the direction of the Mall, the President of the Divorce Court, who did not happen to have the King's pass with him, produced his card, and having thereby established his identity was allowed to proceed without further let or hindrance. The only other man who ever attempted the passage without authority was Earl Russell, who once drove his pair of greys through the archway, in spite of a determined effort to stop him.

Motor-Cars for Irish Farmers.

A SUGGESTION from Birmingham that motor-cars should be used to collect milk from the farmers within a radius of twenty miles from the Midland town and retail it to the artisans, thus doing away with the middleman's profit, is worth consideration by those responsible for the development of the creamery movement in Ireland. In many Irish districts the farmers are now taking their milk to central creameries or butter factories, where it is made into the finished product. If the managers had motor-cars at their disposal the milk could be collected very quickly, and the employment of thirty or forty horses by the individual farmers would be obviated. This system of co-operation has been successful in 400 or 500 districts; its extension to the collection of the milk by motor-car would promote economy, and find an outlet for a large number of cars. We would suggest that those engaged in the motor-car industry in Ireland should bring the matter to the notice of the Department of Agriculture at Dublin.

The Scottish Automobile Club.

THE West of Scotland section of the Scottish Automobile Club have been considering the question of non-stop runs, but, in view of the recent Glasgow trials, they think it hardly necessary to have such on an early date. They have, however, tentatively arranged to have a non-stop run from Glasgow to London prior to the Automobile Club's Show next year, and this will be preceded a month or so earlier by a shorter run of a similar character north of the Tweed. While these may be more specially intended and suited for Scotch manufacturers, they will be open to manufacturers everywhere and to private owners, and we fancy that a successful non-stop run from Glasgow to London will induce special interest in the competing cars when on exhibition.

Unattended Horses.

WE would enter a protest—not for the first time—against the folly of those tradesmen who allow their horses and carts to be in charge of careless lads, who frequently leave the vehicles unattended outside public-houses; or who have to leave them outside houses while delivering goods. Left thus to themselves, horses occasionally display bad temper when motor-cars or traction engines or even tramcars approach, and then the owner blames everybody but himself. If special care is to be taken with regard to leaving motor-vehicles in charge of competent persons, far greater trouble should be taken with regard to animals that are liable to run away on the least provocation. This is a matter the police ought to see to—when they are not engaged in laying traps for unwary motorists.

Unjustifiable Police Interference.

MR. S. F. EDGE has brought to our notice another unjustifiable case of police interference. It occurred at Caterham the other day. He was driving with a friend on the latter's motor-car, which was pulled up at a shop in Caterham. Mr. Edge was sitting on the car, his friend being inside the shop, when two constables—one in plain clothes and one in uniform—came up and informed him that he had no red lamp on his car. As it did not happen to be Mr. Edge's car, he listened to all that they had to say. A large crowd having gathered, the police then asked Mr. Edge for his name and address, which he gave them, assuming that it was for some useful purpose. On the friend learning of the occurrence, he thought it would be as well to find out really what was the matter. So they drove back to the two constables, whose only excuse for taking Mr. Edge's name and address was so that they might have it in case he did something again! They did not suggest that anything illegal was being done at the time as it was not even lighting-up time. Mr. Edge wrote to the police superintendent of the district, placing the facts of the case before him. We are glad to learn that after making enquiries into the matter, the superintendent has offered his apologies for the behaviour of the two policemen, and that the latter have been severely reprimanded for their officiousness.

Speed of Motor-Cars in Scotland.

AT a meeting of the Standing Joint Committee of the County of Aberdeen, a letter was read from Mr. H. D. McCombie, Milton of Kemnay, drawing attention to the excessive speed of motor cars on the public roads, and suggesting that action might be taken with the view of controlling the speed of these vehicles. Major Gordon, Chief Constable of the county, pointed out that his officers had already been instructed with regard to this matter, and only the other day a motorist had been convicted and fined £8 for driving at an excessive speed. The owner of the car informed him that he was sending his vehicle back to France, as it was of no use to him unless he could drive at a greater speed than twelve miles an hour. The matter was an

exceedingly difficult one to deal with, as it was not always easy to say whether a motor-car was going beyond the regulation speed of twelve miles an hour. His instruction to his officers was to use their discretion as much as possible and not to press a case even though the speed did seem to be a mile or two over the regulation pace, if the car was on a clear roadway with no apparent risk of danger, but to at once take steps to prosecute if there was evidently excessive speed within a populous area. Sheriff Robertson said it would perhaps scarcely do for him to express an opinion in the matter, seeing prosecutions for driving at an excessive speed fell to be dealt with either by himself or his colleague, but if he were pressed for an opinion he would be inclined to agree that the matter was one upon which considerable discretion might be exercised.

Absurd Blackpool.

BLACKPOOL — before it possessed its modern electric trams—had such practical evidence of the value of the motor-car that recent proceedings in the town seem very absurd. A northern soap firm intended to take a trip with several thousand people to Blackpool, and sent a motor-car a few days previously. It was not allowed in the streets, because it was an advertising

were the only dogs thus possessing any attention. With regard to passing traffic, Mr. Rouse complains that drivers of heavy horse-drawn vehicles have a habit of keeping on the crown of the road, instead of to their proper side. This is a nuisance often noticed by motorists, and one which the police should minimise by insisting that all traffic should adhere to the rules of the road.

The Folly of Canterbury Councillors.

CANTERBURY is an ancient city, and, judging by the discussion at the last meeting of its local Council, some of its Councillors are of an antique order of thought. Councillor Bourne suggested that the provision of marked distances along certain main roads would be useful in enabling the police to gauge the speed of cars, and Councillor Stone went further, declaring that the Council should stop all motor-cars coming into the town. This idea was toned down by Councillor Goulden, who referred to the difficulty of identifying the drivers of motor-vehicles, and urged that, on entering the city, they should be required to give in their names and addresses at Westgate Towers. Fortunately, the Mayor was more sensible than Councillors

MESSRS. BAMBER, IDEN, AND STANTON ON THE WAY TO EXECUTION. (See last issue.)

car, and as such was forbidden by the bye-laws. The managing director of the soap company told the police it was necessary to have the car in Blackpool on the day of the trip as an office of inquiry and to issue tickets to people who had lost theirs. It was again sent to Blackpool—this time at night—and between five and six o'clock in the morning was sent to a place provided inside the Central Railway Station. As the driver stood with the car in the morning he was served with a summons, and although the Bench took a reasonable view and dismissed the case, the man's time was wasted with such paltry and vexatious proceedings. All this seems very absurd, and certainly unworthy of a town which provides for its patrons in the liberal way that Blackpool has already done.

A Ride to Felixstowe.

MR. J. W. ROUSE, of Arcade Street, Ipswich, has been describing in the local papers a ride he recently had from his own town to Felixstowe on a Teras car belonging to Messrs. Botwood. He testifies to the complete indifference of the horses they passed to the motor-car, and also to the way in which collie dogs ran out to bark at the vehicle. Apparently the collies

Stone and Goulden, and after he had pointed out the absurdity of the idea the matter dropped. But that such a proposal should have been made is significant of the narrow-minded attitude of some municipal leaders with regard to automobilism.

Maidenhead Bridge Tolls.

MR. JOSEPH TAYLOR, of Eton, has set himself the task of freeing Maidenhead Bridge from toll. It may be remembered that last year a Slough motorist declined to pay eightpence toll for the passage of his motor-car over the bridge, which is supposed to belong to the Maidenhead Corporation. The toll collector thereupon seized a cushion, which he disposed of the next day for three shillings. Out of this arises the present agitation, and Mr. Taylor, after due inquiry and probing into the matter, has submitted the case, through his solicitor, to the eminent counsel, Mr. J. G. Witt, K.C., and Mr. W. O. Danckwerts, K.C. Their opinion causes the matter to assume a new phase: that the bridge does not belong to the Maidenhead Corporation, who, on the 1st August, 1836, ceased to have a right to administer the funds of the bridge; that the administration ought to have passed to trustees appointed upon petition by the Lord Chancellor; and that there-

fore the first thing to be done is to direct the attention of the Charity Commissioners to the matter for the purpose of having trustees, if necessary, appointed to administer the trust, and of having an inquiry into the true position of such trust. Maidenhead Bridge was rebuilt in 1772 because the old wooden bridge was rotten. By Act of Parliament nineteen thousand pounds were borrowed on loan, yet since that time it is alleged that something like one hundred and twenty thousand pounds have been received in tolls, while apparently the original debt has never been paid off.

Action to be Taken.

MR. TAYLOR has forwarded the above opinion and particulars of the matter to the Maidenhead Corporation. At the same time, the Corporation has been informed that in the event of their answer not being favourable to the freeing of the bridge from tolls, an influentially signed petition will be immediately presented to His Majesty's Charity Commissioners, with an urgent representation that they shall exercise their legal right, and assume possession of the "Maidenhead Bridge Trust," which has for so many years been antagonistic to the public interest under corporate control. It will be interesting to see what will be the action of the Maidenhead Corporation in the face of this new development, but should it be necessary to push the matter through the law courts, no doubt Mr. Taylor will be strongly supported in his crusade by the majority of people using the bridge. A Maidenhead Bridge Legal Expenses Fund has been started, to which those motorists whose sympathies are with the movement are invited to subscribe. Subscriptions may be sent to Mr. Taylor, High Street, Eton, or to Mr. J. Fulbrook, of the Slough Motor Works, High Street, Slough.

One Good Result.

IT is stated that a combination of Liverpool shipowners are seriously contemplating the organisation of a motor-wagon service between that city and Manchester. The inability of the railway companies which connect the two cities to deliver goods with anything like the despatch necessary has long been a prolific source of complaint to both shipowner and consignee. Naturally, the recent trials held in the locality by the Liverpool Self-Propelled Traffic Association were watched with keen interest, and the present agitation is the direct outcome of the good results then obtained. Two drawbacks to the success of the projected service are the speed limit, five miles an hour, and the weight limit, six tons. There is, however, reason to believe that with the more frequent use of the motor-car for commercial purposes these restrictions may be withdrawn.

A Public Service at Tunbridge Wells.

A NEW motor-car company has recently been formed in Tunbridge Wells for public service, and also for the purpose of running excursions to the surrounding picturesque districts. The cars used are supplied by the Motor Manufacturing Company, Coventry, and are of the wagonette type. Up to the present the service appears to be a very popular one, and it is intended as time goes on to add to the present number of cars, and thus supply a long-felt want to the public. Ample accommodation has been found for workshops and yards, and under the management of Mr. C. Allen, a leading local tradesman, to whose enterprise the service is due, a considerable measure of success is looked forward to.

Yorkshire Automobile Club.

ON Saturday last the Yorkshire Automobile Club held a most successful run to Ilkley. The Harrogate, Leeds, and Bradford members met in their respective districts at 2 p.m., and then proceeded to the general rendezvous at Barley in Wharfedale. The weather being favourable and the roads dustless, the magnificent scenery passed through was fully appreciated. Tea was arranged for 5.30 at the Crescent Hotel. The following members and friends took part:—Mr. T. E. King (Vice-

President), Century tandem; Mr. and Mrs. Barnes, De Dion phaeton, of Harrogate; Messrs. Benbough and McLean, Bollée, of Ilkley; Messrs. Faires and Chadwick, De Dion voiturette; Messrs. Ladmore and friend, Daimler car; Mr. George Firth and friend, quad; Messrs. Hay (Honorary Treasurer), Jones, Berry, Broadbent, and McGuire, all on tricycles, of Bradford; Mr. and Mrs. Burrows, Star car; Mr. Ibbotson and friend, Daimler car; Mr. Martin and Miss Mehew, tricycle and trailer; Messrs. Neumans and Walker, quad; Messrs. A. W. Dougill (Honorary Secretary), H. Noble, Burrows, jun., R. Smith, F. Normanton, and W. Bradley, all on tricycles, of Leeds; and Mr. Wood, Wolseley car, of Halifax.

The American 500-Mile Endurance Contest.

AFTER a trial of severity surpassing by far any test that anyone would ever think of imposing upon horseflesh and conveyances drawn by animals, forty-one motor-vehicles arrived within schedule time at Rochester, N.Y., on the evening of Friday, September 13, out of a total of eighty-one which started from New York on the previous Monday. Several vehicles arrived later, after the control had been closed, and many more might have arrived if their occupants had not considered it wise to abandon the tour when the adversities of the bad roads and weather encountered had caused them to fall behind schedule hours, and deprived them of the chance to be honoured with the certificates to be issued by the Automobile Club of America under the rules of the contest. The announcement of the death of President McKinley became the signal for terminating the contest at Rochester, the run from Rochester to Buffalo being abandoned. To the sorrow and consternation over the President's death thus came keen personal disappointment to several of the contestants over the abrupt termination of the tour. The Club's decision was, however, of course, fully approved.

Calcium Carbide.

IT appears that there is an acute crisis in a manufacture with which most motorists are more or less indirectly concerned—we refer to the calcium carbide industry. To relieve the minds of those who are fond of nocturnal excursions, we hasten to explain that there is no danger of a "corner" in this article, the fact being that production has gone on at such a rate that Germany alone has stock enough to supply the world for some years at the present rate of consumption, and the home makers consider their prospect alarming. It is unfortunate that the history of acetylene motor research has been such a chapter of accidents, as if the difficulties—which are certainly numerous and formidable—could be overcome, a cheap and powerful source of energy would be available, which would, in all probability, find an important field of utility in automobilism. But to this the uncertainty and risk attending the combustion of acetylene mixtures under pressure have offered a hitherto insuperable objection.

Test of Reliability.

A MOST successful run just completed by a 6 h.p. Daimler wagonette, belonging to Mr. F. Morriss, of King's Lynn, is yet another testimonial to the reliability of the motor-car. The vehicle in question was chartered by a party of six gentlemen for a tour to Scotland and back, which journey it performed without the slightest hitch, covering something like 1,400 miles in a fortnight. Travelling *via* Leicester, Manchester, Preston, Lancaster, Carlisle, and on to Glasgow, the car encountered some of the steepest and longest hills in the country, including the notorious Teddington Hill and Shap Fell. The party arrived in Glasgow in four running days from the time the car left Mr. Morriss's depot. Two days were spent in Glasgow, during which time a detour was made to Loch Lomond. The journey was then continued to Stirling, Edinburgh, Galashiels, Newcastle, York, and home, the passengers arriving well pleased and astonished with the trip, and also assured of the possibilities open to the motor-car.

THE "DERBY" MOTOR-BICYCLE.

A MOTOR-BICYCLE which has lately been put on the English market, and which comprises some novel features, is the "Derby," introduced by Messrs. Edward De Poorter and Co., Ltd., of 9, Great Tower Street, E.C. The motor is of 1 h.p., and is carried in the frame, being clipped to the lower cross tube and to the main down tube. The silencer, which is rather larger and longer than usual, so that the motor runs very quietly, is fitted below the front tube, and well out of the way. The battery and induction coil are carried immediately behind the backstays, and beneath the saddle. A throttle and timing handle are conveniently placed on the upper tube of the frame, while the mixture is regulated at the forward end of the petrol tank and carburettor. The usual handle-switch is fitted. The motor, which weighs a little over 20 lbs., is very neatly finished, having an air-cooled cylinders, and oil and dust proof aluminium crank cases. The carburettor and petrol tank are combined in one case clipped to the top tube of the frame. The tank is made large in order to carry a sufficient quantity of petrol (about one gallon) for ordinary journeys (120 miles) without the use of an extra supply tank. A radical departure from all other motor-bicycles is to be found in the method of driving adopted. Hinged to a clip, which can be slid on the main down tube for chain adjustment purposes, is a bell-crank of large size, the forward arm of which forms a handle, and is held in any required position by means of a ratchet on the side of the petrol tank. The rear arm carries a rubber-shod pulley, grooved to fit over the tire of the rear wheel. This pulley is driven by means of a chain acting on a toothed wheel fixed at the side of the pulley and another upon the motor shaft. The pulley runs at practically the same speed as the motor. When the handle is pushed forward, the pulley is raised clear of the tire of the wheel, but when the lever is pulled backwards it is brought into more or less forcible contact with the tire, according to the position of the handle. By this arrangement the motor can be thrown out of gear when the machine is descending hills, and instantly brought into action again by pulling the handle backwards. The pulley appears to obtain a good grip of the tire, and Messrs. De Poorter state that they can, after very long experience and tests, certify that there is no extra wear on the back tire. In addition to complete machines, the firm are also supplying the motor and driving gear separately, to enable cycle makers to build up motor-bicycles themselves.

CONGRATULATIONS to Colonel Crompton on receiving his C.B., and to Captain Laycock, who served on General French's staff, his D.S.O.

ONCE more we warn motorists of the inducement to theft offered by their leaving coats, rugs, and the like on unattended cars. Last week a man was committed for trial for just such an offence, and a Beckenham gentleman who left his motor-car unattended whilst he entered an hotel is the poorer by a rug and an overcoat.

THE EYES AND MOTORING.

IT is essential that anyone driving a motor-car should be able to see in comfort, for there is nothing more annoying, or painful, than at a critical moment to get a fly or dust in the eye, which simply has to be borne until one can pull up. In order to enable one to do so there are various contrivances on the market, and I should like to give my experience of those that I have used to intending purchasers, as I consider some of them are injurious to the eyes. The first pair of glasses I used, writes "A. C. M." in the *Gazette* of the Reading Automobile Club, were an ordinary blue tinted pair, with fine wire gauze at the sides; they were fairly satisfactory, with the exception that at times flies would crawl under them and walk about on the inside of the glass. There was also a continual side draught through the wire gauze across the eyes, which made them constantly water, and was very trying.

The next pair were of talc, and the result was after going a journey or wearing them for some time I always had a headache, due entirely to the fact that the contour of the talc was not perfect, the strain on the eyes to focus through them producing the headache. There is also a celluloid mask on the market which has the same defect as talc, with the addition that it is not so transparent. The pair I am using now have large smoked tinted glasses with a silk mask attached to the rims, and I believe they are as good as anything at present to be obtained; the only objection to them is in driving in a strong wind the silk is apt to flap about.

I find that after a journey there is nothing more beneficial to the eyes than a basin of clean water. Place the head face downwards in the water, and then open and shut the eyes a

few times; in the majority of cases it removes any dust or foreign particles and also has a bracing effect on the tissues of the eye.

MESSRS. FRISWELL, LIMITED, have opened a new department at 48, Holborn Viaduct, which will be devoted to the re-painting, re-plating, "brassing," and generally doing up of motor-cars.

THE Houk Automobile Company, Limited, has been registered, with a capital of £10,000, to carry on in the United Kingdom or elsewhere the business of cycle, motor-car, and general manufacturers, engineers, etc.

THE first of the new motor char-a-bancs ordered by a Scarborough syndicate arrived, after a successful run by road from Northampton, last week. On Monday the vehicle, which is of 12 h.p. and seated for fourteen passengers, made some trial trips of a most satisfactory nature, vanquishing all the local hills, one of which is 1 in 8, with the greatest ease.

MR. R. M. WRIGHT, of Lincoln, who had with him as travelling companion Mr. A. F. Percival, has recently completed a thousand mile tour on a 4½ h.p. De Dion voiturette to Glasgow, Edinburgh, and back, taking in en route many places of interest. Mr. Wright gives a most enthusiastic account of the tour throughout, the scenery, and the conduct of his car.

THE "DERBY" MOTOR-BICYCLE.

FLOTSAM AND JETSAM.

BY "FLANEUR."

DURING the absence of King Edward abroad, the regularity with which he used his English-built motor-car was duly chronicled from day to day, to the satisfaction of all his brother automobilists. One salient factor in the situation, however, has been ignored, and it is of vital interest now that His Majesty is back again in our midst. That the King loves his car is self-evident; he would not have had it specially deported from England, and used it daily while at Homburg and Copenhagen, had the case been otherwise. Why, then, should the car be less in evidence in Great Britain than abroad? The answer is to be found, I fear, in the fact that the King has accurately appraised the innate conservatism of the British public, and realised its inability to accept wholesome changes without the most careful propitiation of its scruples and prepossessions.

So far as London is concerned, the use of the royal car has been confined to quiet runs to Windsor and back. The same measure of publicity, however, as has characterised His Majesty's automobile journeys while abroad would, it need hardly be said, do much to encourage the pastime and industry in this country, and English automobilists cannot but hope that, on the King's return from Balmoral, he will afford the citizens of the Metropolis the same degree of pleasure as that which he has already liberally accorded to those of Homburg and of Copenhagen. For it may be said now with confidence that with the realisation of the practical capacities of the motor-vehicle much of the erstwhile prejudice of the public has disappeared, and those who once derided the appearance of a motor-car in Regent Street now note with pleasure the ease with which it mounts the hill.

THE *County Council Times* has again delivered itself of a frothy editorial on the subject of "Regulations for Motor-cars," and, as in a former instance, when I called attention to its vapourings, has violently misrepresented the facts at issue. The main object of the organ referred to is to chortle over the fact that racing cars in France, by the newly-introduced regulation, will have to carry a distinctive number. "What will the automobilists say now?" gleefully enquires the *C. C. T.* "This is precisely the regulation they have declared to be impossible of adoption if motoring is to make headway in this country; but, in spite of their protests, we shall be surprised if we do not shortly follow the example of our friends on the other side of the Channel." Surely even a schoolboy could expose the fatuity of this painful drivell. Like all other shriekers on the subject of automobile travel, the *C. C. T.* draws no distinction between the high-powered car, built purely for speed purposes, and the ordinary motor-car of moderate power and price. The two types are as distinctive as are the racehorse and the carriage hack. If the self-appointed spokesman of the County and other Councils had any practical acquaintance with the progress of automobilism in this country it would know that the number of the high-powered type is extremely limited; indeed, almost everyone is known by repute among those who are familiar with current automobile topics. Yet the whole trend of the hostile argument in question is to make it appear that these fast cars, and recklessly driven fast cars, are ubiquitous, and a lurid picture of their devastating progress is drawn in a way that is ludicrous in the extreme.

FOR example, it is seriously alleged, in set terms, that among incidents of automobile traffic "of almost daily occurrence" are "London to Lincoln at over sixty miles an hour"; "running over pigs, dogs, and poultry"; "causing serious carriage accidents," and so on. So far from the journey from London to Lincoln being covered at "over sixty miles an hour," there is not a car in England, nor in Europe, that could accomplish the

feat, unless the course was kept throughout by the police. Fancy working through North London at that pace! As for running over pigs and dogs, if there is anything the driver of a motor-car would less willingly do than that one would like to know it, even if we assume, to please the *County Council Times*, that the said driver was entirely destitute of humanitarian feelings. He might at least be credited with a desire to save his own neck, and he would indeed be a fortunate automobilist who could run over a pig and still maintain his control over the steering; in fact, the pig would have a strong chance of escaping serious injury with a pneumatic-tired car, while the probability of the driver being seriously hurt, if not killed outright, is the opposite of remote. The further allegation that "serious carriage accidents" are matters of almost daily occurrence through the instrumentality of the motor-car is in flat violation of fact, and wholly incapable of proof. When a horse takes fright at a motor-car, it is coolly assumed by people of the parish council standard that the car, and not the vice of the animal, the unskillfulness of its driver, or the untrained condition in which it has been put into harness, is entirely to blame. But, even if it be admitted, for argument's sake, that every time a "serious carriage accident" occurs in connection with the meeting of a motor-car, the automobilist is at fault, the attempt to prove that such catastrophes were "of almost daily occurrence" would miserably fail. The *County Council Times* has a good deal to learn as yet on automobile matters, and apparently others also. "Hasty generalisation" has been defined as "the bane of science"; but papers of the *County Council Times* description show that it is the bane of journalism as well.

A FRENCH contemporary has let itself loose in rapturous praises of the ingenuity of M. Boyer, the maker of the well-known cars of that name, because of his resourcefulness the other day when his petrol tank was found to be nearly empty while ascending a steep hill. The method which M. Boyer adopted, and which has so excited the admiration of the journal in question, was simply to turn the car right round, thus shifting the position of the remaining petrol in the tank, and drive up on the reverse gear. One would have thought that the expedient referred to was fairly well known by now; certainly it was adopted over twelve months ago by at least two English *chauffeurs*. Mr. Alfred Bird, of Birmingham, when he acquired his 12 h.p. Panhard, took an early opportunity of testing it on Sunrising Hill, up which he had vowed to take a car or know the reason why. The Panhard went up merrily enough for some distance, and then stopped, with that well-known abrupt cessation of power that implies an interrupted flow of petrol. Examination showed that the gradient was so severe at the point of stoppage that no petrol was passing into the carburettor, but by facing the motor downhill the car went up gaily enough on the reverse. I understand, too, that Mr. S. F. Edge once employed a similar expedient with a Napier car. M. Boyer, therefore, however subjective his ingenuity in this matter, can scarcely claim not to have been anticipated.

It seems only a week or two ago that one read of the Queen of Italy having prospectively become an automobilist by ordering a 12 h.p. car from France. Either the order was placed some time ago or the car was secured at once, for the King and Queen have been touring *en automobile*, and their doings have been pictorially chronicled in the Italian press. While in Italy of late I noticed in successive issues of the leading illustrated weekly a frontispiece depicting the royal pair, in one case being stopped at the French frontier, and in the other sharing an *al fresco* luncheon with a peasant. As the car was of French origin there was no duty to pay, otherwise the *douanier* would doubtless have been considerably startled, when making out a certificate of importation, by the answer to the preliminary query of "*Quel nom?*" The number of royal automobilists, by the way, is now so numerous that there is hardly a reigning house left in Europe which does not include a prominent *chauffeur*.

CORRESPONDENCE.

—8—

THE CYCLE MANUFACTURERS' TRADE PROTECTION ASSOCIATION.

TO THE EDITOR OF *The Motor-Car Journal*.
